COMMISSION.

VICTORIA R.

Victoria, by the Grace of God, of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith.

To Our trusty and well-beloved Robert Rawlinson, Esquire, John Thornhill Harrison, Esquire, and John Thomas Way, Esquire, greeting.

Whereas We have deemed it expedient for divers good causes and considerations that a Commission should forthwith issue for the purpose of inquiring how far the present use of rivers or running waters in England for the purpose of carrying off the sewage of towns and populous places, and the refuse arising from industrial processes and manufactures, can be prevented without risk to the public health or serious injury to such processes and manufactures, and how far such sewage and refuse can be utilised or got rid of otherwise than by discharge into rivers or running waters, or rendered harmless before reaching them; and also for the purpose of inquiring into the effect on the drainage of lands and inhabited places of obstructions to the natural flow of rivers or streams caused by mills, weirs, locks, and other navigation works, and into the best means of remedying any evils thence arising.

Now know ye, that We, reposing great confidence in your zeal and ability, have authorised and appointed, and do by these Presents authorize and appoint, you, the said Robert Rawlinson, John Thornhill Harrison, and John Thomas Way, to be Our Commissioners for the purposes aforesaid.

And for the better enabling you to form a sound judgment on the Premises, We do hereby authorize and empower you, or any two or more of you, to call before you, or any two or more of you, all such persons as you may judge most competent by reason of their situation, knowledge, or experience, to afford you correct information on the subject of this inquiry.

And it is Our further Will and Pleasure that you, or any two or more of you, do report to Us in writing, under your hands and seals, your several proceedings by virtue of this Our Commission, together with your opinion on the several matters herein submitted for your consideration.

And We Will and Command that this Our Commission shall continue in full force and virtue, and that you, Our Commissioners, or any two or more of you, may from time to time proceed in the execution thereof, although the same be not continued from time to time by adjournment.

And for your assistance in the due execution of this our Commission, We have made choice of Our trusty and well-beloved Godfrey Lushington, Esquire, Barrister-at-Law, to be Secretary to this Our Commission, whose services and assistance We require you to avail yourselves of from time to time, as occasion may require.

Given at Our Court at Saint James's, the Eighteenth day of May 1865, in the Twenty-eighth Year of Our Reign.

By Her Majesty's Command.

(Signed) G. GREY.

Instructions to the Commissioners.

Gentlemen, Whitehall, May 30, 1865.

Her Majesty having been pleased to appoint you to be Commissioners for Inquiry into the Pollution of Rivers, I am directed by Secretary Sir George Grey to send you the following instructions for your guidance in the proposed inquiry.

Although it may be taken as proved generally that there is a wide-spread and serious pollution of rivers both from town sewage and the refuse of mines and manufactories, and that town sewage may be turned to profitable account as a manure, there is not sufficient evidence to show that any measure absolutely prohibiting the discharge of such refuse into rivers, or absolutely compelling town authorities to carry it on the lands, might not be remedying one evil at the cost of an evil still more serious, in the shape of injury to health and damage to manufactures. It is, therefore, suggested that your inquiry should include selected river basins, illustrating different classes of employment and population; that these river basins might be :—

1st. The Thames Valley—both as an example of an agricultural river basin, with many navigation works, such as locks and weirs and mills affecting the flow of water, and many towns and some manufactories discharging their sewage and refuse into the stream from which is mainly derived the water supply of the metropolis.

2d. The Mersey Valley—including its feeders, particulary the Irwell, as an example of the river basin, most extensively polluted by all forms of manufacturing refuse, particularly that arising from the cotton manufacture and processes connected therewith.

3d. The Aire and Calder Basin, as an additional example of the same class, particularly in connexion with the woollen and iron manufactories.

4th. The Severn Basin, for the same reason, but in particular connexion with the great seats of the iron trade.

5th. The Taff Valley, in connexion with mining and industry applied to metals.

6th. A river Basin comprising a mining district in Cornwall.

Your special points of inquiry should, it is conceived, be in the Thames Valley. 1. The condition of the river as affected by mills, weirs, and locks, and as affecting the drainage of towns and villages and adjacent lands. 2. The condition of the river, as affected both by the discharge of sewage from towns and villages, and the refuse of manufactories, paper mills, &c., and the possibility of intercepting and rendering useful or innocuous these sources of pollution.

As to the other rivers mentioned, the main object of the inquiry should be how far the use or abuse of the rivers is, under present circumstances, essential to the carrying on the industry of these districts? How far by new arrangements the refuse arising from industrial processes in these districts can be kept out of the streams, or rendered harmless before it reaches them, or utilised or got rid of otherwise than by discharge into running waters? In the course of these investigations you will make inquiry into the effect on health and comfort of the existing system of sewage of towns and populous places in the districts examined, and into the best mode of protecting individual and public interests in the purity of running water.

Secondary questions will, no doubt, arise contingent on these leading points, in which case you will include them, as far as it is necessary, within the scope of your inquiry.

I am, &c.

(Signed) H. Waddington.

R. Rawlinson, Esq.,
J. T. Harrison, Esq.,
J. T. Way, Esq.,
Commissioners to inquire into the
Pollution of Rivers.

Letter from H. Waddington, Esq., to the Commissioners appointed to inquire into the Pollution of Rivers.

Gentlemen, Whitehall, July 7, 1865.

I am directed by Secretary Sir George Grey to transmit to you an extract of a letter from Mr. Charles Neate, and to state that it will be desirable to include in your inquiry into the Pollution of Rivers, the subject of the water supply suggested by Mr. Neate, provided such extension of your inquiry will not materially impede or delay the completion of the primary object of the Commission.

I am, &c.
(Signed) H. Waddington.

The Commissioners appointed to inquire into the Pollution of Rivers,
2, Victoria Street, S.W.

Letter from Charles Neate, Esq., M.P., to the Right Honorable Sir George Grey, Bart., G.C.B., M.P.

Dear Sir, House of Commons, June 27, 1865.

I beg to submit to you, with reference to the Commission recently issued to inquire into the means of remedying the pollution of rivers, that as the scope of that Commission has already been enlarged beyond its original and professed object, so as to include an inquiry into the drainage of "lands and inhabited places," it would be right to extend the inquiry still further as to include the great question of the water supply.

Even if the drainage referred to in the Commission is that only which is required for sanitary purposes, it may still be a question whether you might not subject the health of the country to far greater danger by wasting too rapidly the winter supply of water than it now is liable to from the temporary dampness of the soil in certain places.

The effect of drainage, even to the extent it has been already carried out for agricultural purposes, is a subject of serious alarm to many people, and I think it is matter of pressing interest to inquire how far the general level of springs in the country has been lowered, how far it depends upon the height at which the water is maintained in the neighbouring river, and what is the number of springs that have altogether failed, or at least that fail during the summer.

I believe it to be a matter of urgent necessity to provide reservoirs of water throughout the country, to be used for all purposes but drinking, and that the spring water should be habitually confined to that use.

If the Commission, as it stands, is intended to apply to agricultural drainage, the reasons for extending the inquiry are more, still more cogent, for then it is no longer a conflict between one sanitary purpose and another, but between the health of the country and some increase in the productiveness of the soil.

I remain, &c.
(Signed) Charles Neate.

The Right Honorable Sir George Grey, Bart., G.C.B., M.P., &c., &c., &c.

P.S. I think it would be a great point to inquire whether all the surface drainage of towns might not conveniently be kept out of the service and taken into the rivers.

REPORT.

TO THE QUEEN'S MOST EXCELLENT MAJESTY.

We, Your Majesty's Commissioners appointed by Your Majesty's Commission, dated the 18th day of May 1865, to inquire and report as to the pollution of rivers and running waters, and also as to any remedial measures which may be practicable, having on the 29th March 1866 presented our Report on the main stream of the river Thames, proceeded to examine certain rivers and streams in the manufacturing districts of Yorkshire; but, in consequence of representations made to us upon the subject of an outbreak of cholera in the months of July and August 1866 in Poplar and other parts of the district supplied principally by the East London Waterworks Company, which Company derives its water from the river Lee, we thought it advisable to make earlier inquiry into the pollutions of the river Lee than we otherwise should have done. We commenced to make public inquiry on the 10th December 1866, at the Rivers Commission Offices, No. 2, Victoria Street, Westminster, and we continued such inquiry on the 11th and 15th of the same month, and also on the 4th of February 1867. We also, after due notice in the districts, made public inquiry in the towns of

Luton	on	December 12th	1866.
Bishop Stortford		„ 14th	„
Tottenham		„ 18th	„
Hertford		„ 19th	„
Ware		January 16th	1867.

Information has been given to us by the officials and others connected with the River Lee Trust, the New-River Company and the East London Waterworks Company, and by the several local authorities in the towns and places visited, as also by millers, traders, and others. Tabulated returns are appended to the evidence of several witnesses.

In our Instructions, dated 30th May 1865, we are directed to inspect and report, first, on "the Thames valley, both as an example of an agricultural river basin, with many "navigation works, such as locks and weirs, and mills affecting the flow of water, and "many towns and some manufactories discharging their sewage and refuse into the stream "from which is mainly derived the water supply of the metropolis."

The river Lee is one of the northern tributaries of the lower Thames, rising out of springs in Leegrave Marsh, situated in the county of Bedford, and about three miles above the town of Luton. The upper part of the river and its tributaries drain a considerable area of Hertfordshire. From Waltham Abbey to Blackwall the Lee forms the boundary between the counties of Middlesex and Essex. It is tidal from the Thames to Lee Bridge, a distance of about five miles, and is navigable for barges to Hertford, a total distance of 28 miles. The Stort joins the Lee at Feilde's weir, and is navigable for a distance of 13½ miles.

The area of the entire watershed of the Lee is about 500 square miles, or 320,000 statute acres, the dividing ridges to the west, north, and east, ranging from 450 to 300 feet above medium tide level.

The following is a list of the Tributaries from the north, east, and west into the main River, with the Population (as given in the last census) and number of Mills in the basin of the Lee.

	Boroughs, Towns, Parishes, Hamlets.		No. of Mills.
	No.	Population.	
The Lee proper	54	621,102	31
Tributaries north of Lee:			
Mimram	14	10,269	8
Beane	20	13,265	6
Rib and Quin	16	12,374	6
Ash	9	4,638	3
Tributaries east of Lee:			
Stort and Pincey Brook	27	25,064	12
Cobbins Brook	1	2,105	–
Tributaries west of Lee:			
Turkey Street Brook	4	3,106	–
Salmon Brook	9	21,174	–
Moselle	4	19,975	–
	158	733,072	66

Population in the basin of the Lee above point of abstraction (between Hertford and Ware) of the water by the New River Company, exclusive of Hertford, 73,526.

Population in the basin of the Lee above point of intake (at Ponders End) of the water by the East London Waterworks Company 153,030.

The canals which form junctions with the navigable part of the river are:—

Name of Canal.	Point of Junction with Lee.
Lee Union Canal.	Old Ford.
Limehouse Cut.	Bromley.

Towns and Places on the Banks of the River Lee and the Population as given in the last Census.

Borough, Town, Hamlet.	Population.

Poplar, Middlesex	43,529
	226,088

The geological character of the river Lee basin is shown on a map appended to this Report. From the watershed on the north down to Hoddesdon the area is mostly chalk; from this point southwards towards the Thames the chalk passes beneath the plastic and London clays; in the several valleys the strata are covered by alluvial sand, gravel, and silt. Although the greater portion of the area is described as a natural filter, it is stated in the evidence that out of an average rainfall of 25 inches four-fifths or 20 inches are evaporated. The dry weather flow of the river Lee and its tributaries is described as, for the most part, spring water. The upper portions of the area are seldom flooded; there are, however, heavy floodings in the lower portion. There are also considerable areas of marshy land which arterial and land draining would improve.

The average annual fall of rain is about 25 inches, so that as compared with parts of England on the south and west coasts of Devonshire and Cornwall, or with the northern districts in the neighbourhood of the Solway, where the average fall of rain ranges from 36 up to 60 inches, the climate of the valley of the Lee is comparatively dry.

Mr. Beardmore, Mr. Greaves, and Mr. Muir furnish tabulated returns of local rainfall, which will be found appended to their evidence. It will be seen in these tables that there is considerable variation as to the total volume of rain falling in any one year. An average serves to contrast one district with another district, but taken alone is not a trustworthy guide either for navigation purposes or for water-supply. The test in both cases is the rainfall of the driest years. The wide variation of rainfall is shown in the following extracts from the several tabulated returns.

East London Waterworks.—Mr. Greaves.

		Rainfall.	
1860.	Total depth from January to December - - - - -		32·558
1864.	Ditto ditto - - - - -		15·891

River Lee Navigation.—Mr. Beardmore.

Feilde's Weir, Herts, 90 feet above sea.

		Rainfall.	
1852.	Total depth of rain, January to December - - - -		39·500
1854.	Ditto ditto - - - - -		17·900
1860.	Ditto ditto - - - - -		33·750
1864.	Ditto ditto - - - - -		17·880

New River Waterworks.—Mr. Muir.

Hoddesdon.

		Rainfall.	
1860.	Total depth of rain, January to December - - - -		32·358
1864.	Ditto ditto - - - -		16·405

Enfield.

		Rainfall.	
1860.	Total depth of rain, January to December - - - -		37·125
1864.	Ditto ditto - - - - -		18·490

These returns show as regards the valley of the Lee that in a dry year not quite one-half the depth of rain falls as in a wet year; during dry years much less water flows off the surface of the ground, and spring water is very much reduced in volume. The permanent water capacity of the Lee valley must therefore be measured by the *minimum* volume of rain falling on its surface rather than by the average.

Like the river Thames, the river Lee has been navigable from time immemorial; but whilst on the Thames the navigation works had fallen into ruin, through the abstraction of trade by railways and through neglect, on the Lee the weirs, locks, and other works are at this time in better order, the navigation is more efficient, and the trade is greater, than at any former period. The drainage area of the river Lee, as stated previously, is in round numbers about 500 square miles, the area of the Thames, including the Lee, is about 5,000 square miles, so that the relative areas of the two rivers are as nine to one; but the areas from which water is drawn from the Thames and the Lee respectively for the supply of London are as about eight to one. Five great water companies draw water from the Thames for the west and south of the metropolis, and two great water companies abstract water from the Lee for the supply of the eastern and northern parts of the metropolis. The minimum dry weather flow of the Thames at Teddington lock

is about 350,000,000 gallons of water in each 24 hours, the extreme dry weather flow of water down the Lee at Lee Bridge is little above 40,000,000 gallons in each day of 24 hours. About one-half of the population of the metropolis receive their water supply (some 48,000,000 gallons per day) from the Thames, whilst the other half of the population is supplied with about 38,000,000 gallons from the Lee (as distinct from springs in the valley of the Lee), the New River Company supplying a population of 840,000 persons, and the East London Waterworks Company a population of 675,000 persons; the two companies together supplying 1,515,000 persons out of 3,037,991, the entire population within the metropolitan area. In each case the Water Companies possess statutory powers to draw larger volumes of water than those named, but want of pumping power on the Thames and deficiency of water in the Lee during dry periods have limited the daily volume given in each case up to the present time.

In our first report on the Thames we show that pollution is general from the estuary to the highest point of the main stream. The great intercepting sewers of the metropolis intercept sewage from Hammersmith to Barking Creek on the north side, and from Putney to Crossness Point in Erith Marsh on the southern side, where it is passed into the ebbing tide; the Metropolitan Board of Works has entered into arrangements for the utilization of the sewage on the northern side, and are about to make arrangements for utilizing the sewage on the southern side. By an Act (29 & 30 Vict. c. 89) passed in the last session of Parliament, the Conservators of the Thames received powers to prevent pollution on the main stream of the Thames and of its tributaries for three miles on both sides above Staines, and this session the Conservators have before Parliament a supplemental Thames Navigation Bill, to prevent pollution by sewage from the towns of Richmond, Kingston, Surbiton, East and West Moulsey, New Malden, and Hampton Wick. As in the case of the Thames, so in the case of the Lee, we have found, on inquiry, that pollution of the waters by sewage is general. Details as to this pollution are given in a subsequent part of this Report.

The tidal portion of the Lee and the marshes on both sides of the River Thames were embanked at some early period, beyond any known written or reliable history. The oldest works on the river were the lower embankments, and the earliest works above the tidal flow were no doubt connected with the navigation. Milldams would be constructed at an early date to obtain water-power for grinding corn, and rights of fishing may probaby be as old as any other interest on the river. The earliest population would use and pollute the water to some extent; and as no Conservancy Board has ever had jurisdiction over the entire river-basin, all those portions of the river and of its tributaries not required for navigation or for mill purposes remain, for the most part, in a state of nature; that is, neither embanked nor controlled in any useful way; hence the large areas of neglected marsh-land to be found on both sides of the river down to Lee Bridge. The rapid growth of the metropolis during the last half-century has caused a large increase in the population of the lower part of the valley of the Lee; and as no effective means have been taken to prevent pollution, this has also increased with the growth of population and extension of trade and manufactures. Formerly comparatively little of the water was used for domestic purposes; at present, the entire dry weather volume of the river over and above that required for navigation is taken for domestic and trade purposes.

The lower portion of the Lee valley, where the river forms the eastern boundary of the metropolis, is partially occupied by commerce and trade, but by far the largest area of the watershed above Lee Bridge is agricultural. Luton and the district around have the largest straw-plait trade in the world, and malting is extensively carried on in the towns of Ware and Bishop-Stortford, but in each case the manufacture and trade are principally connected with and contingent upon agriculture. There are water mills on the several streams in the area, but principally on the Stort and on the Lee. These mills are chiefly used for grinding flour; some for crushing out oil. Water-power is used at the Government gunpowder mills near Enfield, and also at the Small Arms Manufactory. There is one small paper mill near Luton. All the water mills on the river Lee, between Ware and Lee Bridge (except the Government mills at and near Enfield, and one at Broxbourne), belong either to the river Lee trustees or to the New River and East London Waterworks Companies. The mills situated on the Stort are private property.

Pollution.—In following the course of the river Lee, in order to estimate its pollution, it may be convenient to consider separately:—

1st. The upper district above the intake of the New River Company at Hertford. 2dly. The middle district included between that point and the intake of the East London Waterworks Company at Ponders End. 3rdly. The lower district to the junction with the Thames at Blackwall.

The upper district contains a population of about 73,000.

The Lee begins to be polluted close to its rise and while yet a slender stream. The first great source of pollution is the sewage and manufacturing refuse of Luton, the largest town in the upper valley, numbering now upwards of 20,000 inhabitants. The town is sewered, and most of the houses in it are drained; and there are at present from 1,000 to 1,500 waterclosets in use. As the result of a compromised litigation with a large landed proprietor in the neighbourhood, the sewage and other refuse, before being cast into the river, are clarified by a liming process. The fresh sewage is mixed with a proper proportion of lime, and the semi-fluid after being so treated is passed into tanks of three or four feet in depth, where a separation of the solids and flocculent matters mechanically suspended takes place; the effluent water more or less clarified flows direct into the stream of the Lee, and downwards to the waterworks and navigation. This process of clarifying sewage improves it in so far as the solids are removed, but the fluid remains sewage, and if allowed to stagnate will become putrid and offensive; mixed with a much larger volume of water and continued in motion it seems to become purer as well as more clarified by the effects of the subsoil, air, and light, and after flowing a few miles the water loses a further portion of the sewage ingredients.

The bleaching and dyeing of straw-plait, the manufacture of which is the staple trade of the town, is undoubtedly a source of very considerable pollution of the water of the river Lee. Large quantities of various metallic salts, dye-stuffs, brimstone, and other objectionable and, in some cases, poisonous materials are, after use in the processes of cleansing, bleaching, and dyeing of the goods, discharged into the stream from which water for the domestic use of a large portion of London is drawn. It is true that the substances so finding their way into the river Lee, though large in quantity in the aggregate, are diluted in the much larger volume of water, and that there are natural influences at work which serve greatly to modify their noxious properties. We learn, indeed, with something approaching to dismay in the first instance, that one manufacturer alone employs from one to two tons of oxalic acid in bleaching straw-plaits, but are somewhat re-assured upon consideration that the poisonous character of this substance is entirely destroyed by admixture with the carbonate and sulphate of lime contained in the water of the river. But the answer to this as to other like pleas for pollution of rivers founded upon the counteracting influences of natural causes is, that we ought not to be dependent upon any such fortuitous protection. No justification of the discharge of these refuse-matters into the river can be offered. There is no reason to believe that they would in any way be injurious to vegetation when mixed with sewage, and although it is shown in evidence that the bleaching, and more especially the dyeing, of straw-plait is to a great extent carried out in detail, and on so small a scale as to preclude separate purification of the refuse, there can be no reason why it should not pass into the sewage, and with the sewage on to land.

The town next in importance to Luton is Hatfield, which contains a population of about 4,300. The plan for disposal of the sewage was adopted with a view to its complete exclusion from the river. But it is essentially a "*dumb-well*" system, and the effect must be more or less to pollute the subsoil water, which after passing through the chalk or gravel subsequently finds its way to the river.

Except at Luton and Hatfield, the sewage of the upper district is not dealt with remedially in any manner. Villages and houses situated immediately on the banks of the stream, no doubt pollute the river; thus we were informed that "Whitwell is a place "where privies hang over the water, and in Welwyn the whole of the sewage runs in." To a certain extent also the river is polluted by sheep-washing, which is carried on upon a large scale. The preparation used for dipping sheep contains arsenic; and when sheep come to be washed months after they have been dipped, the poisonous ingredients, it would appear, remain in the wool sufficient to make the water for the time unwholesome for fish to live in. But from the general district (exclusive of towns on the river and tributaries) the pollution is insignificant, the population being chiefly agricultural. Almost all the water falling upon this part of the Lee basin is absorbed or evaporated. The Lee and its tributaries above Hertford are consequently rarely flooded, and but slight abrasion of the surface takes place, so that scarcely any refuse is washed into the streams.

The middle district, lying between the commencement of the New River at Hertford and the intake of the East London Waterworks at Ponders End, comprises a population of 79,000 persons.

Hertford might seem to be more properly placed in the upper district, because it is a short distance above the point of the commencement of the New River, and formerly

its sewers delivered into the Lee above the same point. But by an Act passed in 1854 the New River Company obtained powers to lay down intercepting main sewers through the town; to construct works for treating the sewage by the liming process; and to convey the effluent water past the New River head into the Lee above the town of Ware. The New River Company have completed these sewerage and outlet works at an outlay of about 22,000*l.* and maintain them; they also subject the sewage to a liming process at a further cost of about 700*l.* per annum, sparing neither trouble nor money. The effluent water usually passes away clear, but being, as it is, the sewage of nearly 7,000 persons, it cannot be otherwise than a nuisance, and it is, according to the evidence, a constant cause of complaint to the people of Ware.

Ware, in its turn, in the disposal of its sewage, shows no consideration for towns below. It is a town numbering some 6,000 inhabitants, and its sewers receive the discharge from upwards of 220 waterclosets, as well as household drainage. This sewage, without any liming or other sort of treatment, is passed direct into the river by several outlets, an arrangement which tends to diminish the local nuisance, but does not diminish the total amount of pollution caused to the river. In addition, the authorities of the town of Ware cause putrid refuse from cesspools to be conveyed beyond the town and there thrown into gravel-pits. The soakage from these masses of refuse must in some degree pollute water in adjoining wells, and also the subsoil water which eventually reaches the river.

Below the town of Ware the Lee is joined by the river Stort. In time of flood the Stort brings down large accumulations of sewage and mud from the towns on the banks above. The chief of these is Bishop-Stortford, a town of upwards of 5,000 inhabitants. Drains are general throughout this town, though main sewers have not been laid down on any proper system; these drains receive and discharge into the river the sewage refuse of the streets, houses, and other places, as also the contents of upwards of 300 water-closets. The effects of this pollution are very sensible at the lower part of the Stort. Mr. Garratt, of Hunsdon-Mill, which is about eight miles below Bishop-Stortford, describes the river as becoming yearly fouler and fouler; every house on the river drains into it; farm-yards also; carcases float on the surface, and the bed becomes silted up with refuse.

At Ware, Bishop-Stortford, and other places on the river Lee and its tributaries, the process of malting barley is largely carried on, and gives rise to a pollution of the streams which is objectionable rather in a local than a general sense. The liquid which results from the steeping of barley to cause it to germinate, is a solution of various vegetable substances, not in themselves injurious, but liable to become offensive by fermentation. The evidence tends to show that this result does frequently occur, and the discharge of the liquid into the rivers is, under any circumstances, to be deprecated. On the other hand this refuse, which is objectionable in the river, would be beneficial to land; and as in most instances the maltsters' operations are carried on in the towns or in close proximity to them, the obvious method of disposal of the steep-liquid is through the sewers on to the land.

Below the junction of the Stort, the towns of Hoddesdon, Broxbourne, Cheshunt, Waltham-Abbey, Waltham-Cross, and Enfield-Highway, discharge sewage into the Lee.

The Lower District commences from the intake of the East London Water-works Company at Ponders End. From this point the river ceases to be a source of water supply, and becomes, in a great degree, like an open common sewer. At the foot of Tottenham Lock is the outfall of Catchwater-Dyke, an open ditch which the East London Waterworks Company under their Act of 1853 have constructed to intercept the sewage of the towns on the west of the Lee for some miles above the reservoirs of the company, and to discharge it below. From this single outlet the Lee receives the sewage of Enfield, Edmonton, Hornsey, Chipping-Barnet, East-Barnet, and Hadley, in its original condition, unmitigated by any process, except so far as it has undergone oxidation in its course along the open ditch. The outlet itself is very offensive in summer. Immediately below are situated the Tottenham sewage works with an outlet into the river Lee. Tottenham is at present a town of some 16,000 inhabitants, having upwards of 2,000 waterclosets, and a water supply of 400,000 gallons per day. The subsoil and open ditches bring the volume of water discharged from the district up to 700,000 gallons each day. The sewage at Tottenham is limed and the solids precipitated, but the effluent water retains so much sewage matter that the Lee Trustees, as protectors of the navigation, and of the health of those employed upon it, have recently obtained from the Court of Chancery an injunction to prevent the Local Board of Tottenham from casting their sewage into the river, so as to create a nuisance.

Leyton, Leytonstone, and Walthamstowe, from the Essex side add, as stated in the evidence, considerable pollution to the Lee.

West Ham, a large and now populous parish, with four-fifths of its houses provided with waterclosets, throws the whole of its sewage into the receding tidal water of the Lee near to its junction with the Thames. The pumping of this sewage costs the locality at present 1,000*l.* per annum. A large volume of sewage at each low water is also discharged by gravitation; but so foul is the river Lee here that we were told by the engineer to the Local Board that this enormous volume of sewage makes absolutely no visible alteration in the river. It should be stated that the discharge at this point into the Lee of the West Ham sewage, is only a temporary arrangement, and an alteration is now under consideration.

Pollution from sewage and refuse of manufactories, notwithstanding the efforts of the Lee Trustees to prevent it, is much on the increase. Large sums of money are spent in dredging out sewage-mud which has accumulated in the bed of the river. The river at Old Ford is rendered very pestiferous during hot weather from the discharge of impurities from large chemical and other works on the banks. The Limehouse cut in summer is also very foul. The district immediately bordering the tidal portion of the Lee has become a nuisance district, the seat of trades expelled beyond the limits of the better parts of the metropolis.

The evils of this pollution are greatly aggravated by two causes, shortness of fresh water in the river Lee and the action (rising and falling) of the tide. The Water Companies now draw direct from the Lee about 38,000,000 gallons of water daily and in consequence, during the extreme droughts of summer, the volume of the river below the intake of the East London Waterworks Company probably would not much exceed the 5,500,000 gallons to which the Lee Trustees are entitled above Old Ford Lock. Thus whilst the pollutions tend to multiply, the water wherewith they might be diluted tends to fail. At neap tides the river is reduced to a small foul stream, oscillating at the bottom of a muddy creek, and there exposes an area of eight acres of oozy mud and sewage deposit, verging into a state of putridity. During the last two summers the engineer to the Lee Trust has thought it advisable not to open the gates at Bow Locks for the receding tide. The flood tide flows through, bringing up vast quantities of refuse from the Thames and the Lee, and being locked in at Limehouse and Bow, deposits the sewage. Thus the evil is ever accumulating.

Sewage of Towns on the Lee.—The variety of systems now in operation and which have been attempted by towns situated within the Lee basin to get rid of their sewage, shows the difficulty that is experienced in dealing with it.

Luton, Hertford, Enfield, and Tottenham have sewage works. At Enfield the solid part of the sewage is separated and the fluid goes to the river; at the other towns the lime process is adopted. Ware, Bishop-Stortford, Edmonton, and other towns pass sewage into the Lee and its tributaries without any attempt at clarification. The visiting justices at Colney-Hatch tried irrigation by hydrants, but it was considered unsatisfactory, though the crops were reported to be good. The British Land Company tried filtration through burnt gravel at East-Barnet; at present the sewage is passed into dumb-wells, but the attempt to get rid of it in this manner is said to be a failure at both these places. At Hatfield the solid matter is first separated and the liquid is allowed to soak into the chalk. The sewage of Hornsey and Wood-Green passes into the Tottenham ditches, there stagnates and creates a great nuisance; that of Chipping-Barnet produces a similar nuisance at East-Barnet.

Cesspools exist to some extent in every town situated within the area; the contents are usually carted on to the land, but the Board of Health of Ware cart much refuse into gravel-pits beyond the town, where it wastes away in the subsoil on the dumb-well system.

Every plan hitherto adopted is unsatisfactory. The lime process does not purify the sewage even when carried out most carefully by the New River Water Company as at Hertford. The discharge of effluent water from these works and *à fortiori* sewage direct from towns into the Lee and its tributaries should be strictly prohibited. The practice of passing sewage into dumb-wells cannot be justified, it must contaminate water to some extent, though it would be difficult to prove it in many cases. The water percolating to the subsoil of the Lee basin liable to this pollution may be used subsequently for domestic purposes. The nuisances occasioned by passing sewage into open ditches shows that any general prohibition against sewage being carried into rivers or running streams should extend to its discharge into ditches and watercourses of all descriptions, although they may be occasionally dry. Open cesspools too frequently partake of the character of dumb-wells, with this important aggravation that they poison the shallow wells near them instead of the water of deep-seated springs. The mischievous

effects of these cesspools on the health of the inhabitants were clearly proved at Luton, Ware, and Mile End Old Town, and such cesspools should be compulsorily closed.

Closets or privies supplied with dry earth or ashes may be adopted where the water-closet system is not introduced; they should be built at least 10 feet from any house, be properly managed, and frequently cleaned out, under vigilant inspection from the local authorities. When these conditions are complied with, they do not injuriously affect the health of the people.

All nightsoil and sewage should be conveyed rapidly and regularly to the land in some way or other; it is a manure too valuable to be wasted as at present; if allowed to remain and ferment among the persons producing it, it is sure to cause disease; on the other hand, nothing can justify the common practice of merely getting rid of it irrespective of the injury and annoyance it may cause to others.

All main sewers and house-drains should be fully ventilated; at Luton, and other towns where a system of sewerage has been carried out without proper ventilation, sickness has invariably resulted from gases entering the houses.

We have received very conclusive evidence as to the success of waterclosets for the poor where they are properly looked after, as at West-Ham and Mile-End Old-Town.

Litigation.—The Lee exemplifies the evils inevitably entailed by absence of river government. Left without control, towns naturally take advantage of running water to get rid of their sewage, regardless of the fact that the process is simply a transfer of the nuisance from themselves to their neighbours lower down the stream; litigation follows; but litigation besides being expensive and breeding ill-will is unsatisfactory. Courts of law are in fact incompetent to deal with the difficulty, and too frequently the party proceeded against may not possess either the legal power or the pecuniary means to provide by permanent works a good and sufficient remedy. The town authorities of Luton are under a perpetual injunction obtained against them by a wealthy landed proprietor in the neighbourhood, which prohibits them from casting their sewage into the river unless it has been first treated by lime. The people of Luton have carried out the injunction strictly, and have remained safe. The New River Company which, as already stated, subjects the Hertford sewage to the same process, and in a still more careful manner, is nevertheless complained of and threatened with litigation by the authorities of Ware. But in both cases the result is the same; the large sums are annually spent in vain, the effluent water remains to all purposes sewage, and, except to the eye, the Lee receives both from Luton and Hertford almost as much sewage pollution as if that process had never been performed. In point of fact, if a river is really foul, it is safer that it should look so.

The authorities of Bishop Stortford resort to singular operations to deliver themselves from their sewage, which the clerk to the Board of Guardians thus describes:

"The nuisance of which the inhabitants have complained from the smell of the river was during last "summer and the summer before, but it was very much abated in consequence of our having wet seasons, "and a plan was adopted that succeeded remarkably well, and that was this: during the summer, when "the water is very short, the filth will sometimes almost crop up to the mouth of the drains, and when "there has been a flood in the winter this accumulation has been stirred up by a barge and a heavy rake "behind, so that we have passed it on to our neighbours to some extent. We thought we had kept it long "enough, and by use of the flood water relieved ourselves from a considerable quantity of stink by that means."

Bishop Stortford has hitherto escaped litigation, but the same witness informed us,—

"We have been threatened by several parties. Our neighbours at Sawbridgeworth have told us that we "have been poisoning them. We have said that we are sorry for it, but we think that they contribute to the "nuisance to some extent themselves, and we have therefore not heeded what they had to say."

Millers on the same stream are almost obliged to resort to similar practices by way of self-defence. Mr. Garratt, of Hunsdon Mill, who has been much troubled with accumulation of mud, says,—

"I find that other people send the mud to me; and I had a large hoe constructed, and I put four horses to "it, and I sent the mud down again into the navigation. It is cheaper than throwing it out."

The condition of the lower end of the valley, where the population is much denser, and adoption of the watercloset system is more general, is of course much worse. Various towns on the Lee, and local authorities on the outskirts of London, have been or are at litigation one with another. To preserve the purity of Edmonton Brook, Edmonton has obtained an injunction against Enfield, and is applying for an injunction against the Trustees of Colney Hatch Lunatic Asylum. Tottenham last year instituted proceedings against Hornsey for fouling Moselle Stream, but although both the fact of the nuisance and the right of Tottenham to relief were equally undoubted, no relief could be given by the law, because there was no public body at Hornsey to be made amenable. The Lee Trustees a few years ago obtained an injunction against the Metropolitan Board of Works, and 820*l.* damages in respect of injury done to the navigation by discharge of sewage from storm-water outlets belonging to the Board. The Lee Trustees also

recently filed a bill against the authorities of Tottenham, to put an end to the nuisance from their sewage works, and especially to prevent the sewage of Wood-Green and West-Green, which are districts within Tottenham parish, being added to the sewage of the rest of the parish, which is now discharged into the Lee. An injunction with costs has been granted, and the consequence will be that the sewerage works of Wood Green and West Green, which the Tottenham Board of Health have just completed at a cost of 9,000*l.*, will be rendered useless; that the population of the two districts will be condemned to fall back on the noxious system of cesspools, already temporarily made; and lastly, that the overflow from these cesspools will be a nuisance not only to the parish, but also to its neighbours; and so perhaps Tottenham may escape from its litigation with the Lee Trustees only to find itself involved in litigation with Edmonton. The only means of putting an end to this litigation is for the Legislature to prohibit throughout the valley the casting of sewage into flowing water, and to create a Conservancy Board whose duty it shall be to see the prohibition carried into effect.

Sewage can very generally throughout the Lee basin be applied to land without difficulty, by gravitation. When pumping is required, towns may fairly be required to adopt it. The purification of the watershed of the river Lee from sewage may involve separate sewerage systems, and also the application of sewage to land for agricultural uses at several points, as at Dunstable, Luton, Stevenage, Buntingford, Bishop-Stortford, Harlow, and several towns and villages in the lower valley, from Hertford and Ware downwards. Schemes to drain all the towns and villages below Hertford would probably be very costly in the first outlay, because the subsoil is so full of water that large volumes of spring and subsoil water would enter sewers and drains in process of formation. On the other hand, under proper control, this abundance of water would eventually be an advantage, as sewage largely diluted is moved to the outlet more quickly and steadily and in a fresher state than when sewers and subsoil are dryer. Combination of the sewerage of towns situated in the higher or middle districts of the valley would involve large and long expensive culverts, whereas small sewage farms would find a readier market for the produce than large farms removed from the population. In the lower valley it may be difficult or impossible to obtain land for sewage irrigation, and it may be expedient, and it is certainly possible, for such towns as Enfield, Edmonton, Tottenham, and other districts, to combine and carry their sewage by continuous sewers either to the Metropolitan outlet or to land in the lower valley of the Thames.

Application of Sewage for Purposes of Irrigation.—In our Report on the Thames, (pages 12 to 15,) we have described at some length the modes of sewage irrigation as practised at Croydon, Norwood, Worthing, Carlisle, and Edinburgh; we have little to add to this account other than that experience confirms the practice of this mode of disposing of sewage. In the course of our inquiry we have received evidence as to its advantage. At this time, April 18th, there are crops of Italian rye-grass at Worthing grown under sewage irrigation, which are being cut at the rate of from five to eight tons to the acre, whilst adjoining pasture-lands are almost bare. A small dairy has been established, the cows being stall-fed on the cut grass; the milk produced, from its richness and superior quality, commanding a preference in the town. A sewage farm requires special and peculiar management; the operations should be specially adapted to this mode of culture, and then it will be found that any land may be improved. The operations do not turn clay lands into swamps, although 60 inches in depth of sewage are added by irrigation to the rainfall. The dressings with sewage must be even and at regulated intervals. In all cases sewage should be used fresh, that is before putrescence has set in, so as to prevent any effluvium arising from the irrigated land. Where this is the case there cannot be any just grounds for complaint. Where clay lands are irrigated, and the contour of the land will admit of the operation, a second and even a third use of the water may be made with advantage.

Sewage irrigation works cannot be too simple in their character; the application should be by surface carriers, not by underground piping and hose and jet. Land which has been worked in ridge and furrow will require levelling, that is the soil should be stripped or the ground be broken up so as to bring the surface even. Main carriers should be laid in nearly level lines so as to command the area below, and secondary carriers at from half a chain to one chain apart should contour the entire surface. The main carriers may be covered in, having valves or sluice-boards of an inexpensive and simple kind to retain and let out sewage as required. The main carriers will be of brick or of earthenware pipes in size proportioned to the volume of sewage to be distributed. Conduits below 18 inches in diameter may be made most cheaply of earthenware pipes: brickwork may be cheaper for conduits of larger cross-sections. Small carriers may be formed with common agricultural tiles, but jointed and laid only three parts in the soil,

so that one tile or more than one tile can be removed temporarily at any point to allow of surface overflowing at such points when the tiles are removed for this purpose. All ordinary conduits may be open trenches, readily formed by hand labour or by the plough. These subsidiary contour gutters must not necessarily be looked upon as permanent. After one sowing of Italian grass has run its course (this should not exceed two years) these minor conduits may be ploughed up with the rest of the land. Some farmers will probably clean the land by taking a root crop off it, and then lay it down again for a second course of Italian rye-grass, and so on. Proper irrigation and cultivation neither fouls the land nor exhausts it. Where sewage irrigation is the cause of a nuisance it will be found to proceed either from use of old and putrid sewage in large and foul open ditch-like carriers, or from open tanks and large carriers being allowed to become foul.

A sewage farm not only requires a peculiar mode of cultivation, but also special management in dealing with the produce. Tolerably good land under sewage will produce from five to seven crops of Italian grass per annum, weighing in the aggregate when green from 50 to 60 tons per acre. A first cutting at Worthing, in May 1865, was from 20 to 25 tons per acre. The grass is used to the best advantage on the day it is cut and is most profitably applied to stall-feeding dairy cows. With such rapid growth and weight of grass a special market for the produce of the land must be provided to prevent waste, failure, and disappointment ; but as milk and butter are a necessity, and as good milk and butter will command a preference in the market, there need not be any difficulty with a sewage farm because of its great productiveness. This has been, however, a complaint made against sewage irrigation in some places—a market did not offer means for immediate sale, the grass spoiled in keeping, and therefore the experiment was pronounced a failure. In course of time sewage farming will become a special business, and when it is found that there is more profit in a sewage farm than in an ordinary farm, the system of sewage irrigation will have been solved. Where there is sewage there must be population. Milk, butter, and beef will therefore necessarily be in proportionate demand; so that, when the true use of sewage is understood, that which is the cause of nuisance by being wasted will be turned to profit on the land.

Floods.—The valleys above Hertford are seldom injuriously flooded, as the chalk subsoil is absorbent, and the gradients are tolerably steep. When floods do occur, the water, though turbid for the time, subsides rapidly and soon becomes clear again. Below Hertford, floods are liable to act injuriously, the water remaining longer on the adjoining marsh lands. Mr. Beardmore stated that heavy floodings had taken place in May 1824, in November 1852, and in October 1857, and that at such times large areas of land were laid under water for several days.

The marsh-lands on both sides of the lower Thames are not subject to such flooding, as the embankments are found to be sufficient to shut out the tides, and the primitive sewers, marsh-ditches, and tidal outlet-sluices regulate the delivery of flood waters so as to prevent injury to land. The marsh districts on both sides of the lower Lee are now subject to the double evil of flooding and droughts; during long continued dry weather the surface cracks until there are fissures several feet in depth. Flood water is passed much more rapidly down the valley of the Lee in consequence of the improvements made of late years in the navigation by dredging the channels. Much, however, remains to be done which would improve the conditions of the marsh-land and the health of the people.

The evidence as to the water-mills proves that in many instances the dams and ponds act injuriously by preventing land drainage and impeding floods. However useful water-power may have been in former times, when these mills were first established, that use has now been greatly reduced in relative value, and, wherever there is sufficient trade to make grinding corn a profitable occupation, steam-power has to be brought in as an auxiliary, the improved navigation and railway accommodation facilitating the delivery of coals so as to give an advantage to steam over the constantly alternating and uncertain flow of water. Water-power having diminished in commercial value, and land for agricultural purposes having greatly increased in value, injury to the adjoining lands may be shown to cause an annual money loss to the district. To this money loss must be added injury to health by the retention of large areas of undrained land. Water-mills and mill-dams are proved to be injurious to local properties, but we have no evidence as to any serious pollutions being caused by these mills, other than so far as they cause a partial stagnation in the water and accumulations of mud by ponding. The rivers are not abused as in the manufacturing districts, by being made the receptacle of solids. Furnace-ashes are too valuable to be so injuriously wasted,

and the River Lee trust is active in preventing abuse and pollution within the extent of its jurisdiction.

Rights of Lee Trust and Water Companies.—The right of appropriation of the water in the Lee is determined by Statute 18 & 19 Vict. c. 196. The general result of these provisions is that the Lee Trust has a paramount right to water required for the purposes of the navigation, and that the remainder of the water is divided between the two Water Companies, practically in equal shares. The priorities are fixed in the following order:—

1. Right of the Lee Trust to pass through their locks,
   - α. For the Upper Reach, extending from the highest point where water is drawn by either of the Companies down to and including the first lock above Feilde's weir, a volume of water not exceeding in any 24 hours 576,000 cubic feet.
   - β. For the Middle Reach, extending from the first lock above Feilde's weir down to and including Waltham Town lock, a volume not exceeding in any 24 hours 720,000 cubic feet.
   - γ. For the Lower Reach, extending from Waltham Town lock down to and including Old Ford lock, a volume not exceeding in any 24 hours 864,000 cubic feet.
2. Right of the Lee Trust to draw such further quantity as shall be necessary, in each pond of the navigation, to maintain the water on a level with the customary head level of that pond.
3. Right of the New River Company to take 2,500 cubic feet a minute.
4. Right of the East London Waterworks Company to take 2,500 cubic feet a minute.
5. Right of each Waterworks Company to take *pari passu* 500 cubic feet a minute.
6. Right of each Company after notice to take *pari passu* any additional quantity.
7. Right of Lee Trust to whole of water below Tottenham mill.

The Lee Trust receives annual payments from each of the two Companies, viz., 1,500*l.* from the New River Company and 2,000*l.* from the East London Waterworks Company.

The New River Company has also contributed 42,000*l.* to the Lee Trust for construction of navigation works.

River Lee Trust.—The navigation of the river Lee, as we have previously stated, is the oldest interest connected with the river. King Alfred is known to have visited Ware by water. Parliament legislated for the Lee in the reign of Queen Elizabeth. The incorporation of the River Lee Trust took place, however, in the session of 1850. On the lower tidal portion from the Thames to Bow Locks, there is a mixed jurisdiction of the Conservators of the Thames, the Essex Sewer Commissioners, and the River Lee Trustees. The total length of the navigable portion, from Blackwall to Hertford, is about 28 miles; the total rise in this distance is 110 feet; there are 20 locks, besides extra locks for flood overflows and minor purposes; up to Enfield the river is deeper and the locks are wider than above—96 feet in length, and 18 feet 6 inches wide—on this part of the navigation barges drawing 6 feet of water and bearing 110 tons can travel. From Enfield to Hertford the locks are also 96 feet in length, some are 16, others only 13 feet wide, and the depth of water is reduced to 4 feet: barges bearing more than 85 tons cannot navigate this upper portion. The oldest locks and weirs were, like those described on the Thames, of a primitive and rude character. Betwixt the years 1770 and 1780, Smeaton improved the navigation, under powers contained in an Act 7 George 3. cap. 57. It was at this period that locks partially constructed of masonry were first introduced. Nearly all these early and comparatively rude works have now been superseded; the existing improved and efficient works having for the most part been designed and executed by Nathaniel Beardmore, Esq., C.E, the present Engineer-in-Chief of the River Lee Navigation.

The navigation is of the utmost importance to the district, as is abundantly shown by its active condition, railway rivalry having failed to injure the river trade as in the case of the upper Thames. We have no hesitation in coming to the conclusion that the navigation of the river Lee must be maintained, as it confers a local value on land, on trade, and on all other property, far greater than the cost of maintaining the existing works. The two great Water Companies, which are now rival claimants for the water, have both come in upon the navigation long subsequent to its establishment

The navigation requires a steady, regulated depth and volume of water, sufficient to supply the locks. The river betwixt lock and lock has in some parts more the character of a canal than the wide open reaches on the upper Thames.

The Lee Trust is an unpaid body, the constitution of which is herein-after described. Particulars as to the state of traffic will be found in the evidence of the Marquis of Salisbury, Mr. Marchant, and Mr. Glass, who are respectively the Chairman, Clerk, and Traffic Manager of the Trust. The Trustees are empowered to raise 230,000*l.* upon the credit of the Trust, of which they have already raised 174,287*l.* The Trust derives its income from tolls, from the annual payments of the water companies, and from the rentals of mills and other property. The whole revenue of the Trust is vested in the Trustees and is applicable to payment of charges and to maintenance of the navigation.

The river Lee Trustees dredge the river, cut weeds, cleanse the channel, and cause floating carcases to be removed from the water—these are seldom, however, seen above Tottenham. There are no rigid rules to prevent or to regulate bathing: the trustees, in fact, act as conservators for the navigable portion of the river as regards its trade only, but not as special conservators for any other purposes. The soil of the bed of the Lee is vested in the Trust, but their legal powers are limited to the navigable portions of the river and to navigation purposes.

Stort Navigation.—The navigation upon the Stort was established in 1769, and is regulated by the provisions of 6 Geo. III. c. 78. The Act empowered the Undertakers to construct the works, and to take certain tolls for the use of the navigation. It also appointed a large number of noblemen and gentlemen as Commissioners, to protect the various interests of land owners, millowners, and others that might be affected. Vacancies amongst the Commissioners were to be filled up by the election of the survivors; the qualification required being the possession of a life interest in land to the amount of 40*l.* per annum, or of personal property to the extent of 800*l.*

The navigation extends from Feilde's Weir near Rye House on the Lee to Stortford, a length of 13½ miles, and is constructed for vessels capable of carrying from 40 to 50 tons each. The annual traffic amounts to about 60,000 tons weight of goods. The navigation has passed into the hands of a private firm, which became entitled to it by foreclosure under a mortgage for 40,000*l.* The body of Commissioners, from the omission to supply the places of defunct members, has become extinct. Great inconvenience ensues. Millers complain of the navigation and the owners of the navigation complain of the millers, and there are no means of redress from the absence of Commissioners authorized to settle such disputes.

The present owners of the navigation have power to dredge, and the expenses of dredging have been greatly increased by sewage thrown into the river at Bishop-Stortford, and at other places. This pollution the owners of the navigation, with their limited statutory rights and in the present condition of the law, are powerless to prevent.

New River Company.—The New River conduit was commenced by Sir Hugh Myddelton in the reign of James I. The source of the New River is in Chadwell springs, but water is now also derived from the River Lee direct, at a point between Hertford and Ware. The drainage area above this point is almost entirely chalk, and in dry seasons the entire volume of water is due to springs. The Chadwell springs vary in volume from 290 to 700 cubic feet per minute. By the River Lee Act of 1855 the volume of water which the company is empowered to take from the Lee is defined, as already explained; this volume has not, however, been taken. The average volume drawn appears to have been about 18,000,000 gallons per diem. The minimum flow at the point of abstraction is stated to be about 27,000,000 gallons. The extent of pollution of the River above the intake of the Company has been already considered under the head of Pollution. Besides the water from Chadwell springs and the river Lee, the New River Company obtain water from wells and borings; one well sunk and bored near the town of Ware has not been used for some time. There are also wells at Amwell Hill, at Cheshunt, and at Hoddesden. There are subsiding reservoirs, 40 acres in extent, at Stoke Newington, and about 8 acres at Hornsey, or 48 acres in the whole. The engineer, Mr. Muir, stated that the amount of sediment in the water was small, as also that the filtering was simply through sand-filter beds, which have been in use since 1856, situated as under:—

Hornsey	2 acres in extent.
Stoke Newington	5 „
New River Head	2½ „
Total	9½ „

New filter-beds of about two acres in extent are in course of construction. Charcoal-filtration has been tried experimentally, but, supposing it to be practically successful, the Engineer estimated that it would cost the company not less than 94,000*l.* if permanently adopted, and that this would be too great an outlay. The Engineer also stated that the New-River Company have, from all sources, a volume of 35,000,000 gallons per day to rely upon, though they have never delivered any such volume. There are at this date upwards of 112,000 houses supplied by the New River Company, having about 7·5 inhabitants to each house, or a total population, in round numbers, of upwards of 840,000, and the demand for water in the locality is increasing. The greater proportion of these houses have waterclosets. The company supply water by meter; at present there are 720 meters in use which register about 2,300,000 gallons per day. The total volume of water delivered per day in December last for all purposes was 22,500,000, which, deducting 2,300,000 used for trade purposes, leaves 20,200,000 as the domestic supply, or about 24 gallons per head of the entire population, or, including water for trade purposes, about 27 gallons each per day. Out of the total number of 112,000 houses supplied, not more than 1,200 or 1,300 are on the constant system; all the rest are supplied intermittently for about 35 minutes, six days in the week; but a large number of the inferior houses have a supply on Sundays. The time the water is turned on seems, however, in some respects to be left to the discretion of the turncock, who is expected to fill the cisterns of ordinary capacity. Some blocks of houses have cisterns, but in many of the poorer parts there are only tubs, pots, and pans, and if from any cause the tenant is not in the way when the water is on, the supply for that day must be begged or stolen. The Company does not hold itself liable for anything but delivering the water; the means of storing the water from day to day, from Saturday to Monday, must be provided and maintained in efficient order by the landlord or tenant; Mr. Muir, the Engineer to the Company, stated that the present arrangements are of a very wretched character. The Company have laid pipes to the doors of the houses, and yet some landlords will not go to any expense in making provision for laying in and storing water. Although, as is shown, the Company pump and pass into the district a daily volume for domestic uses equal to some 24 gallons per head, man, woman, and child, yet by experiments with model lodging-houses, where a constant supply was given for all requirements, the inhabitants, it was found, did not consume more than about 7 gallons per head. At present the eastern part of the metropolis has a daily volume of water poured in, far more than careful experiments prove to be necessary for all purposes, and yet so wretchedly defective are the landlord's arrangements for storing water, that there is a water famine, and the complaints are constant, very loud, and very angry.

The New River, like some other of our oldest waterworks, at first supplied water through pipes of wood. Stone and earthenware were also used for water distribution in these early days: the first cast-iron pipes had flange-joints; now socket-joints are alone used. Some of the cast-iron pipes first laid have been found after 60 years' use perfectly sound. The mains of the New River Company vary in diameter from 36 inches down to 3 inches.

The length of the New River conduit as originally laid out by Sir Hugh Myddelton was about 38 miles, but by cutting off bends, straightening and improving, it is now not more than 28 miles in length. The cross-sectional area is about 75 square feet, and the velocity about four-tenths of a mile per hour; the fall is not more than 1 in 10,000, and the flow is checked by gates and sluices; the bed of the river-conduit is not pitched with masonry or protected by concrete, but is the natural subsoil, with clay-puddle where required.

The New-River conduit is preserved free from pollution. There are fish in it, and all rights to fish are vested in the Company. The soil of the bed of the conduit is vested in the Company, and in some instances the banks also for some distance on both sides.

The present capital of the Company is 3,000,000*l.* sterling, and a dividend a little over six per cent. is paid.

East London Waterworks Company.—The East London Waterworks Company commenced operations by purchasing two old works, one situated at Shadwell, the other situated at West Ham. In 1807 the first Act was obtained, and in 1809 the works were opened, but on a very small scale; the capital, at the outset, being 120,000*l.*; at present the capital is 1,300,000*l.*, consisting of stock, 975,000*l.* receiving 6 per cent., and shares 325,000*l.* receiving 4½ per cent. The dividends in the first instance did not exceed 2 per cent., and from 1820 to 1822 a suspension of dividends took place. The works, when first established, took water from the open river and within tidal influences at Old

Ford. In 1825-26 application was made to Parliament to remove the intake up to Lee Bridge, from which place the water was brought down in an open conduit, and was stored in open reservoirs at Old Ford, from whence it was then pumped for use. The intake is now at a point not far from Ponders End in the parallel of Stonebridge Lock.

The Company have, in station and reservoir area with other land, about 400 statute acres. On a portion of this land a storage reservoir exists capable of containing about 170,000,000 gallons of water or 8½ days' supply, which can be drawn upon during the time the river water is muddy by reason of floods.

In addition to this reservoir the works at present consist of an open conduit from Enfield to Lee Bridge 1¼ mile long, having a cross-sectional area of 100 feet in which the water flows 20 feet per minute; filter beds 12 acres in extent; pure water basin and pumping establishment at Lee Bridge; a cast-iron conduit of 48 inches diameter, capable of conveying 20,000,000 gallons of filtered water per day from Lee Bridge to Old Ford, where there is a covered reservoir, and additional pumping power. There is also water-power for pumping but not on any large scale. There is steam pumping power equal to 1,100 or 1,200 horse-power requiring about 6,000 tons of Newcastle small coal at 12*s.* 6*d.* per ton per annum. The lift is about 112 feet vertical. There are about 500 miles of cast-iron mains, varying from the conduit of 48 inches down to 3 inches in diameter. By the last returns about 90,000 houses are supplied, which at 7·5 per house gives a population of 675,000. The volume of water is about 20,000,000 gallons per day for all purposes, or upwards of 29 gallons per head, or (exclusive of what is taken for trade purposes) about 18½ gallons per head of the population.

The supply is partly constant, but chiefly intermittent. The Company supply water largely for trade purposes, mostly by meters from mains constantly full. Some houses of the better class and some cottage-houses are also supplied on the constant system direct from the mains. Over the greater portion of the district in dwellings above the class of court-houses the inhabitants have tanks or tubs which are filled each day. The supply becomes in part constant in all cases where the Company can treat with landlords willing to make proper storage arrangements in tanks and cisterns, which may be filled each day. The supply of water to house-property of an inferior class is for the most part intermittent, and only on six days in the week, Sunday not being a day of supply. The water is turned on for about half an hour each day; in many of the courts the apparatus is an open wrought-iron stand pipe of about one inch in diameter having no valve upon it, so that the water flows to waste under whatever local pressure there may be when not actually being caught by some one or other of the inhabitants. This defective and unsatisfactory mode of supply leads to great waste of water even during the short period of half an hour. Also the receptacles, where they exist, are often unfit to store the water. Some tanks are placed over the watercloset and dust-bin, and the open tubs stand in small crowded yards, exposed to any dirt, dust, or atmospheric contamination there may be.

Waterclosets are largely used throughout the entire district. At Christmas, 1865, out of 78,710 houses there were 36,214 having waterclosets supplied with water.

With regard to the quality of the water, the water drawn at Ponders End is not of course so pure as that taken by the New River Company higher up the stream, because the river in its course over the intervening space has received additional impurities from towns and places, as already detailed under the head of pollution, but this difference is greatly diminished by the fact that between Hertford and Ponders End the Lee has been reinforced by a large accession of fresh water from the land springs which break out from the chalk into the bed of the river. The result is, as the analyses show, that the East London Waterworks Company are able to obtain a fair wholesome water. The Company have gone to great expense to improve the water before it passes to their filter-beds, by the construction (under statutory powers) of Catchwater Dyke to intercept sewage of certain towns above the intake, and to deliver it at a point below. In a bill now before Parliament the East London Waterworks Company propose an extension of this system of intercepting sewers.

The process of sand-filtration is conducted successfully, though at some seasons under difficulties. A rapid growth of weeds takes place on the sand of the filter-beds, especially during hot weather in summer. The water, as it is delivered from the mains, is proved by the analyses published by the Registrar-General to be equal in quality to the average of the London waters.

Serious charges, however, have been made that the outbreak of the cholera, which in the months of July and August last year took place in the east end of London, is to be attributed to the water furnished by the Company from its reservoirs at Old Ford,

whence the suffering districts drew their supply. We did not consider it incumbent upon this Commission to institute a medical inquiry into all the particulars of this special case, though the evidence we received incidentally bore upon the subject. Suffice it to say that on the one hand the water supplied by the Company at this period from its Old Ford reservoirs had received an admixture of some unfiltered water drawn from an open and partially abandoned reservoir, and that on the other hand there were several local conditions—the low level of the district, the use of polluted wells, the saturation with sewage of the subsoil, and the excessive accumulation of stagnant sewage in ditches and cuts arising in great measure from the storm overflows of the metropolitan sewerage works—the concurrence of which at that season were calculated to produce cholera. Under these circumstances we do not feel justified in attributing the cholera to any one cause exclusively. But the act of the Company in drawing water from the open reservoir for domestic consumption was unquestionably reprehensible. The Company have now entirely cut off all direct means of communication with this source of supply, and we assume that on no future occasion will this water again be resorted to.

Improvement in Water Supply.—With regard to the capability of the river Lee to meet the increasing demand for water supply in the eastern districts of London, the entire volume of water daily drawn direct from the river Lee amounts to 38,000,000 gallons, the New-River Company drawing upon an average 18,000,000 gallons, and the East London Waterworks Company 20,000,000 gallons. In very dry seasons some difficulty is experienced by the latter Company in obtaining their customary volume. It may therefore be taken that no dependence can be placed upon an increase of the supply from the river without the construction of impounding reservoirs on a much larger scale than those now in existence. The construction of such reservoirs has been a matter considered by the Lee Trust and by the Water Companies. The Marquis of Salisbury explained to the Commission a system of impounding reservoirs designed by the late Mr. Rendel for the Lee basin—two to be constructed on the Lee itself, and others on the Ash, Rib, and the Amwell Marsh—capable of holding some 6,212,500,000 gallons of water, a volume sufficient for 140 days' supply at the present rate of delivery from the Lee. It is questionable whether these chalk valleys can afford sites for reservoirs to hold such large volumes of water, unless great expense were incurred in puddling. In Mr. Muir's opinion it would be very difficult to make large reservoirs above Hertford. Extensive reservoirs might with ease be made below the point where the Lee passes from the chalk on to the London clay. The reservoirs of the East London Company, in which there is storage for 170,000,000 gallons of water, cover 120 acres. But reservoirs to hold the volume of water contemplated by the late Mr. Rendel would probably require an area of 2,000 or 3,000 acres; and though large storage reservoirs may be made available to reserve flood waters, yet if, in dependence upon such a store, a corresponding enlargement were made in the area of supply, then, in the event of several dry years following each other, the continued drought would most probably end in the exhaustion of such store, and consequently in temporary failure.

Another question which naturally presents itself is, whether the water of the Lee valley, when its collection and transmission to the metropolis have been surrounded by all practicable safeguards from pollution, will be of such a quality as to satisfy the reasonable wants of the population.

The various streams which contribute water to the river Lee have their sources at considerable distances from each other and flow through very varying soils. Their general characteristic, however, is that given by the chalk, from which the great bulk of the water is derived. That this is so will be seen by the following analyses taken from the different streams during the present month :—

	1 Lee, above Luton.	2 Lee, at Hyde Bridge, above Wheathampstead.	3 Mimram, above Welwyn.	4 Beane, at Watton.	5 Beane, at Stapleford.	6 Mimram, below Hertingfordbury.	7 Lee, below Hertford.	8 Lee, above Hertford.	9 New River, near Ware.	10 Lee, above Ware.	11 Lee, below Ware.	12 Rib and Quin, near Wades Mill.

The samples were collected during the week ending the 17th of April, in this year, and analyzed in the Laboratory of the Commission.

In the third line which shows the solid residue in each gallon of the water, if we omit No. 21, which is altogether abnormal and derived from a stream of small importance, we find the figures to range from 20½ grains to 27½. The same is true of the hardness which, omitting numbers 21 and 22, varies from 15 degrees (No. 23.) to 18·1 degrees (No. 13).

The water (No. 22) from Turkey Street brook is only about half the hardness of the rest of the samples. This stream is evidently supplied in great part by surface water, and it is liable to great variations in volume from flood and drought. The samples are (in common with all chalk or limestone waters) reduced in hardness by boiling. The line of figures set down as "temporary hardness" shows to what extent this softening result is obtainable.

The general similarity of composition in all these samples is very striking, the only deviations of any importance being in respect of the quantity of organic matter. The effect of the contamination of the tributaries of the Lee, by impurity from external sources, is exhibited by contrast with the water of the New River, which contains

less than half the organic impurity found in some of the other samples. The New River owes this superiority partly to its being to a great extent derived from springs flowing direct from the chalk, and partly to the fact that the aqueduct by which it is brought to the metropolis is devoted to no other purpose than that of a water carrier, and is most jealously guarded from pollution in its course. It may not be possible to raise to the standard of the New River the quality of the water of the lower Lee, which has received the Ash, Stort, and other tributaries, draining large areas of clay and liable to frequent floodings; but it cannot be doubted that, if proper measures be adopted to protect the river from avoidable pollution, a great improvement in its purity will be secured.

Such a system of protection of the water of the river Thames has already been inaugurated by the Act of last Session. We recommend that similar protection be secured to the water of the river Lee by the early action of Parliament. The question whether a navigation should be allowed to continue a proper conduit for water destined for the Metropolitan supply is one which deserves serious consideration.

Water Supply of Towns in Lee Basin.—Water is abundant throughout the valley of the Lee. Notwithstanding this, however, some of the towns are badly supplied, and sickness is distinctly attributed to the use of well-water polluted by cesspools. At Tottenham, Edmonton, and other towns the mains of the New River and East London Waterworks Companies are accessible, and are to a limited degree used; but some dissatisfaction is felt at the rates charged by the Companies, and at the exclusive right of the Companies to use the water of the Lee.

Conservancy.—Hitherto, the management of the Lee, so far as there has been a management, has been vested in the Lee Trustees; but as before mentioned, the jurisdiction of this corporation is confined to the navigable channel, and it is only as incidental to their duty to protect the navigation that they possess any authority to prevent pollution or to regulate the height of water and other matters. In their hands the undertaking has been a commercial success; the navigation is well maintained and it is a valuable convenience to towns on the banks and to districts inaccessible to railways; also the river improvements have been found beneficial to the health and comfort of the inhabitants of the valley. Abuses by mills, which in the Thames valley cause such disastrous floodings, have in a great measure been controlled in the Lee. Nor have the Trustees, in the exercise of such powers as they possess for the protection of navigation, been remiss in restraining the pollution of the lower part of the river. Altogether they seem to have administered their Trust well. The Trustees, we are assured by their chairman (the Marquis of Salisbury), consider that without any other change beyond an extension of power, they (the Trustees) are as a body competent to undertake the Conservancy of the river basin for all purposes, and would regard with disfavour any proposition to vest the duties in other hands. To this view we are unable to assent. In our opinion the present constitution of the Lee Trust is not fitted for that of a Board of Conservators.

The present constitution of the Lee Trust is fixed by the conjoint operation of several statutes. By the 16th section of 12 Geo. II., c. 32, the Lord Mayor, Aldermen, and Recorder of the city of London, the Parliamentary representatives of the counties of Middlesex, Essex, and Hertford, and of the city of Westminster, and the boroughs of Colchester and Rochester, were declared to be *ex officio* Trustees, and with them numerous other gentlemen were personally associated as trustees. To these the Act 7 Geo. III., c. 51, sec. 1, added more than 100 others, and further increased the list of *ex officio* Trustees by the Comptroller of the works and revenues of London Bridge, the Mayor and Recorder of Hertford, and the Governor, Deputy-Governor, and Treasurer of the New River Company; and by the 72nd and 75th sections it was prescribed that future vacancies should be filled up by election—the electors to be the Trustees themselves, or any seven of them, and the qualification to be that the person elected should be residing in the same county as that wherein the person whose vacancy was being filled up had resided, and further should, in his own right or the right of his wife, be in receipt of rents of landed property to the value of 100*l.* per annum. By 13 & 14 Vict. c. 109, the Trustees were incorporated. The vacancies as they have occurred have not been regularly filled up, and there are now, we are informed, 67 Trustees, including the *ex officio* members.

The interests which demand representation in any body having the government of the River Lee are, the navigation; the riparian owners; the towns on the banks of the different streams; the traders and wharfingers using the river: both the great Water Companies; the water consumers; the proprietors of the Stort Navigation; and lastly, the Central Government, whose presence at a Conservancy Board is essential to a due regard

being paid to the various interests, and especially to the public health. Some of these interests are no doubt sufficiently provided for by the present Trust; but there are others which have no direct means of making their wishes known.

To add to the Lee Trust, numbering as it already does 67 persons, new members to represent the above-mentioned interests, would in our opinion be to add to a body already far too large, and to render it incapable of efficient working. Still more impracticable would it be to have two bodies; to retain the Lee Trust (whether in an independent or surbordinate position) for the exercise of their present function of regulating the navigation, and to create a Conservancy to watch over all the interests of the river except navigation. Unity of management, so desirable in all undertakings, is, in river administration, an absolute condition of success.

We recommend that the Lee Trust cease to exist except for the purpose of providing electors as herein-after mentioned; that their powers, rights, and property be transferred to a Conservancy Board which shall have charge of all the interests connected with the rivers, and that on that Board the Lee Trust be largely represented. The present staff of the Lee Trust should be retained, and thus the Conservancy would be enabled to start on its career with a complement of officers of local knowledge, long experience, and tried ability. The present Chairman of the Lee Trust would preside over the Conservancy Board, and the leading members of the Trust would continue to be associated with him. But the multitude of those who are now but nominal members of the Trust and who have no real concern in the undertaking would be superseded for all purposes except that of being electors, and be replaced by a limited number of active governors. In this way there might be established a good working body, compact in its constitution and adequately representing all the interests of the river basin.

We would propose a body not exceeding 15 in number, composed as under:—

5 Members to represent the navigation (the first five to be the present Chairman of the Lee Trust, with four of the existing Trustees to be elected by the existing body; future vacancies to be filled up by election by Members of Lee Trust.)
1 Member to be nominated by proprietors of Stort navigation.
2 Members to represent the New River Company, viz., the Chairman, Deputy Chairman, or Treasurer, for the time being.
2 Members to represent the East London Waterworks Company.
2 Members to be appointed by the Corporation of the City of London.
1 Member to represent and be chosen by Traders on the Lee and the Stort.
1 Member to be nominated by the Home Office.
1 Member to be nominated by the Board of Trade.

15

Provision should be made for members to go out by rotation, at fixed intervals.

The exact proportion which in the establishment of the Conservancy Board should be assigned to the various interests represented is not a matter upon which we lay much stress, it is a matter of detail; other arrangements than the one suggested might answer equally well. We contemplate that the need for a representative of the Stort navigation would shortly cease to exist. The Conservancy should have power to purchase the interest of the firm who now own that navigation. In the meantime that interest should nominate a representative to the Conservancy Board, which, in its turn, would not only succeed to the place of the defunct Commissioners of the Stort, but, for the purpose of protecting the river from pollution and the valley from floodings, would receive powers enabling them to control that navigation.

A Conservancy Board, such as we have indicated, would be equal to its duties, and would command the confidence of the public. The interests of the navigation could not suffer in the hands of such a Board, nor would the position of the bondholders of the Lee Trust be injuriously affected; on the contrary it might be improved if, as in our opinion would be just and politic, they received a first charge upon the funds of the Conservancy from whatever source.

In some respects the suggested change of the constitution of the Lee Trust is analogous to the recent change in the management of the Thames. In the case of both rivers the result will be the same, the substitution of a small governing body for a multitudinous collection of nominal governors, and the consolidation into the hands of a single administration of all the powers requisite to be exercised for any purpose throughout the watershed. But the reason for the change is very different in the two cases; in the case of the Lee the motive for change is not past failure of the existing government, but the necessity of wider action for the future; and therefore it is that the modification which we recommend in the Lee Trust is in the nature not so much of an absorption into a new body, as of an establishment on a stronger basis.

The Conservators should be furnished with complete powers. In addition to maintaining the navigable channel and managing the traffic of the navigation, they should be responsible for the due observance throughout the water-shed of statutory prohibitions against the pollution of water which can reach the river, and for keeping the bed and banks both of the river and the navigation in such a condition as to render the channel a fit carrier of pure water to the metropolis. The Conservators should also superintend the execution of works of arterial drainage in the watershed, and would be a guarantee that such works were carried out properly, and not for the benefit of some districts to the injury of others.

With regard to the funds required to meet the cost of the proposed measures, the Lee Trustees have, strictly speaking, no income, the surplus profits of the navigation which remain after defraying the cost of dredging the bed and maintaining the banks of the navigation being applicable to the reduction of the bonded debt of the Trust. However, it is unnecessary to expect that the expenses entailed upon the Conservators would be considerable. The cost of all works of arterial drainage and of works of improvement of the bed or banks of the river in places where it is not navigable would fall not upon the Conservators but exclusively upon the property benefited, the Conservancy being in fact merely a machinery to assist the co-operation of riparian proprietors, and to prevent the opposition of a few being a bar to the execution of works required for the common good of the district. Each town and village would justly be required to bear the cost of all works for the interception of its own sewage from the river, and for the disposal of it by irrigation or otherwise. The chief additional expense created by the institution of the Conservancy would be the maintenance of a staff to see that throughout the watershed the laws and regulations prohibiting the pollution of running water were strictly observed. This expense would rightly fall upon those most interested in the purity of the river, viz., the metropolitan consumers of water derived from the Lee, and these consumers would be most conveniently reached by the charge being in the first instance thrown upon the Water Companies who supply them. The right which the Companies possess to obtain water from the Lee, in such volume and purity as are now attainable, has been purchased by them at large cost. The New River Company has constructed sewers for Hertford at an outlay of 22,000*l.* and maintains the outlet works at a further cost of 700*l.* per annum: and to the Lee Trust it has contributed 42,000*l.* for navigation works, and makes an annual payment of 1,500*l.* In like manner the East London Waterworks Company has constructed the intercepting sewer, called Catchwater Dyke, to protect its intake, and pays to the Lee Trust 2,000*l.* per annum. But this expenditure of the Companies is no objection to a further charge being laid upon them to secure a new gain. To the consumers of water from the Lee—one half of the population of the metropolis—the purer quality of water which the Lee would yield in consequence of the institution of measures to protect it throughout its course, would far more than compensate for the slight addition made to the water rate, which would be required to meet the expense of such measures. Both the Companies, we were informed by their officers, would be not unwilling to make an equitable contribution for this purpose. In fact the East London Waterworks Company are, as appears by their Bill now before Parliament, proposing to protect their intake by constructing additional intercepting sewers —works the expense of which properly belongs to the towns that require them. We therefore recommend that, to meet the expenses of the conservancy, the profits of the Navigation should be supplemented by a charge upon the Water Companies. In adjusting the proportion in which this charge should be borne between the two Companies, regard should be had to the fact that, as compared with the East London Waterworks Company, the New River Company, although they draw a larger volume of water from the Lee valley, draw a smaller volume from the river itself, and that from a higher point in its course, where it is not liable to the greater part of the pollution which it will be the duty of the Conservancy to prevent.

Conclusions.

We now beg most humbly, in this our Second Report, to lay before Your Majesty the main conclusions to which we have been led by our inquiry:—

That the waters of the river Lee and of its tributaries are polluted by town sewage and also by refuse from manufactures.

That there has been much private litigation in consequence of local nuisances, and that the law in respect of pollution of running water is in an unsatisfactory condition.

That portions of the river may be improved by embankments, and that considerable areas of land require arterial drainage.

That there are milldams which injuriously impede the free flow of water, and cause injury to adjoining lands.

That it is expedient that more stringent measures be adopted to protect from pollution that portion of the Metropolitan water supply which is derived from the Lee.

That a Board of Conservancy is required for the river Lee, the Lee trustees having powers confined to the navigable portion of the river, and only for the protection of the navigation.

That the limit of supply of water from the river Lee, available without the construction of extensive storage reservoirs, has been fully reached.

That much of the water now supplied to the metropolis is wasted owing to the absence of proper means of distribution.

Recommendations.

We humbly submit the following recommendations to Your Majesty:—

That the charge of the entire watershed of the river Lee be vested in a Conservancy Board consisting of 15 members, to be appointed as herein-before mentioned.

That the powers and property of the Lee Trust be transferred to the said Conservancy.

That the Conservators receive powers to purchase the Stort Navigation, with a view to consolidate it with the navigation of the Lee.

That after the lapse of a period to be allowed for alteration of existing arrangements it may be made unlawful for any sewage, unless the same has been passed over land so as to become purified, or for any injurious refuse from manufactures or agriculture, to be cast into the river Lee or into any of its tributaries, and that persons offending in this respect be made liable to penalties to be recovered summarily.

That it be incumbent upon the Conservators to see to the enforcement of the prohibitions that may be established against pollution of the river, and that for this purpose power be given to them to visit and inspect works, and, after due notice, to close the outlets of sewers, drains, and discharge-pipes into the river or its tributaries.

That, in the event of the funds derived from the navigation, together with the annual payments now made by the New River and East London Waterworks Companies, proving insufficient to meet the expenses of measures taken by the Conservators for the protection of the river from pollution, the said Companies be called upon to contribute in equitable proportion such further sum as may be necessary, not exceeding a *maximum* to be fixed by Parliament.

That powers be given to the Conservators to make embankments and to drain and improve marsh lands, and carry out arterial drainage operations, the cost of such improvements to be met by a rate upon the properties so improved.

That the Public Works Loan Commissioners be authorized to make advances to the Conservators upon such security as shall seem sufficient.

That Legislative measures be passed to render it compulsory upon each Company to supply water upon the "constant system" throughout its district, and upon owners of houses to furnish their houses with proper arrangements to receive such supply.

All which we humbly certify to Your Majesty, under our hands and seals.

(Signed) ROBERT RAWLINSON. (L.S.)

MINUTES OF EVIDENCE

TAKEN BEFORE

THE COMMISSIONERS

APPOINTED TO INQUIRE INTO

THE BEST MEANS OF REMEDYING THE POLLUTION OF RIVERS.

INQUIRY INTO THE STATE OF THE RIVER LEE.

Westminster, Monday, 10th December 1866.

PRESENT:

ROBERT RAWLINSON, ESQ., C.B., IN THE CHAIR.

JOHN THORNHILL HARRISON, ESQ. | Professor JOHN THOMAS WAY.

(*Chairman.*) Gentlemen,—The nature of the evidence which we propose taking is indicated in the following terms:—"Notice is hereby given that the "Rivers Commissioners will hold a public inquiry at "No. 2, Victoria Street, Westminster, on Monday "and Tuesday, December 10th and 11th, relative to "the state of the river Lee and its tributaries. They "will be prepared to receive evidence under the fol- "lowing heads: 1. Pollution by town sewage. 2. "Pollution by other forms of refuse. 3. Nature and "extent of manufactures carried on upon the banks "of the river Lee and streams, and involving the use "or pollution of the water. 4. Cause and extent of "flooding upon adjacent lands. 5. Water supply, "especially as affecting the river Lee and its tributary "streams." Our attention has been specially drawn to the river Lee by letters from the Privy Council Office, enclosing a memorial from a private association formed for inquiring into the defective water supply of the metropolis, and also by an application from the Secretary of the East London Waterworks Company.* If any of the officials of the River Lee Company wish to see the memorial they can do so.

LONDON.

Mr. E. Bates

10 Dec. 1866

Mr. ELIHU BATES (London) examined.

1. (*Chairman.*) You are secretary to the East London Waterworks Company?—I am.

2. When was that company established?—The bill passed in 1807, and the works were opened in 1809.

3. Do you know what was the extent of the supply in the first instance?—It was very small indeed.

4. Do you know what the capital was then?—The company started by purchasing two other old established works, the Shadwell waterworks at Shadwell, and the West Ham waterworks at West Ham, and entering into the district which had been previously supplied by the New River Company. Our capital I think at the outset was something like 120,000*l.*

5. Then you have increased the capital progressively from time to time?—We have.

6. Up to the present time?—Yes.

7. Do you know what your capital is at present?—If the shares were all paid up (they are nearly so) our capital would consist of 1,300,000*l.*; a small portion of that is not yet paid, but it will be.

8. Did you pay any dividends at the commencement?—Our dividends for a series of years were very small indeed; only two per cent. per annum for a considerable number of years. I am now speaking without book, but to the best of my memory up to the year 1820 the dividends were very small; from 1820 to 1822 a suspension of dividends took place. From that time our dividends have increased, and they are now what may be considered a fair remuneration for the capital employed.

9. What are your present dividends?—Our present dividends on the stock are six per cent. The stock consists of 975,000*l.* out of the 1,300,000*l.* Upon the shares we are paying 4½ per cent. at the present time, which will continue up to 1868, when they will merge into capital the ordinary stock.

10. Have you any power under your Act to recoup yourselves in the first instance for the losses upon the capital embarked?—No special power.

11. Has the loss in the first quarter of this century been considered a dead loss?—Quite so.

12. Then you had no power to consider that in your future dividend?—No, excepting that you may consider that the Waterworks Clauses Consolidation Act enables us to pay back dividends, to make up the dividends to 10 per cent.

13. Have you borrowed any money upon the security of your works?—We owe nothing at the present time. The capital which I have stated is our whole responsibility.

14. And it is all capital upon which you can pay the full dividend?—It is capital upon which we pay the full dividend.

15. Whatever that dividend may be?—Yes.

16. Have you any restriction as to dividend?—Yes, but not in our own Act. I think that the Waterworks Clauses Consolidation Act limits us to 10 per cent.

17. Then if you rise to 10 per cent. you must give extended accommodation, or reduce your rate of charge?—I presume so.

18. Or pay up your back dividends?—Or pay up our back dividends. I am afraid that we are a long way off paying for the past time.

19. Do you know the number of your customers?—About 90,000; we call it 90,000 houses. We give returns monthly to the Registrar-General, which are the true figures as far as we can render them.

20. Of course you know what you supply for domestic purposes and what you supply for trade purposes?—Yes, that is to say we can ascertain the

* Copy of the application will be found printed at the end of he evidence of Mr. Bates, the secretary to the company.

LONDON.

Mr. E. Bates.

10 Dec. 1866.

amount for trade purposes and deduct it from the total quantity of water pumped. Our trade supplies are at present almost entirely through meters.

21. For the means of calculating the sums which are due there is a record of the measure by meters? —There is.

22. There is also a record of the sums paid?—Yes.

23. And you also have a record of the purposes to which the water is put in trade?—Yes.

24. Can a return of the supply for domestic and trade purposes be furnished?—Yes, it can for 1865.

25. Do you supply water gratuitously for any public purposes, such as for fires?—For fires, certainly. As a rule we do not supply water gratuitously for public purposes. There are special cases where we write off rates, for instance, a small affair like the Cholera Hospital in Commercial Street; we wrote off the rate there, but it was only an act of grace.

26. As the evidence which we are now taking will no doubt become parliamentary, I think that it would be advisable that you should state as fully as possible any cases where you have written off the rates?—All hospitals and charities we as a rule supply at half-rate, but I cannot say that we give gratuitous supplies, with the exception of fires, not to any great extent.

27. Do you remember at your board any discussions or objections as to the fouling of your water by river pollutions before you receive it?—No, nothing from outside at all.

28. Amongst yourselves have you had any discussions as to the growing pollution by the extension of buildings above your point of abstraction?—Not as a general rule. The only cases in which such a statement has appeared before the board have been from the reports of our own engineer.

29. I suppose that it is notorious to the outside world, and that it must have been notorious to the company, that pollution has been growing up with the growth of the population?—It has been a growing pollution.

30. Do you know the number of points where pollution now passes into the water supply?—I do not.

31. Have you had any complaints by your customers as to the condition of the water, either this year or previously?—Never.

32. Have you a book containing a record of any complaints made?—We have a book in which we enter every complaint which comes, whatever it may be.

33. Would the company, in your opinion, object to giving us a copy of that complaint book for the last 12 months?—Not at all; you may have the book here and see the book itself.

34. How long have you filtered your water; I presume that you did not filter it in the first instance?—We did not filter it until after the Act passed in 1852. We had some thought of filtering it, but the inquiry which was then promoted by the Government led us to postpone further plans until after 1851 or 1852.

35. Previously to that period the water was supplied as it came from the conduit, and was stored in your reservoirs without filtration?—When our bill first passed we took the tidal water at Old Ford. In 1825 or 1826 application was made to Parliament to enable us to take the water at Lee Bridge. It was conveyed from Lee Bridge to Old Ford in an open canal into open reservoirs, where it was allowed to deposit, and it was thence pumped. In 1852 a further Act was passed enabling us to take the water from a higher source and to divert sewage, and to filter and to supply water partly from Lee Bridge, and partly from Old Ford.

36. To divert sewage from where?—To divert the sewage so as to render the river pure from Enfield downwards.

37. Within the last year or two have you contemplated any proposed extensions of your works, either in reservoirs, or in filter beds, or in engine power, or in any other way?—We have constructed additional reservoirs. We are always liable to be called upon for additional engine power. Our district is growing rapidly, and we have a constant necessity to be looking a-head, and to provide for a further supply, so that our thoughts have been continually upon the subject.

38. Have you land enough in your possession now to make your projected improvements?—We have now 120 acres of reservoir, which we had not three or four years ago. We have obtained that additional land under this power, and can obtain 100 acres further.

39. Do you contemplate having a further bill before Parliament?—We intend to have two bills before Parliament.

40. For proposed extensions and alterations?—Yes.

41. Of course, whatever those bills are, they speak for themselves?—Yes. Here are the notices for them (*producing the same*).

42. And whatever powers you obtain will depend upon what you have applied for, and upon what committees of Parliament will grant you?—Certainly.

43. Therefore that must be in the future?—Yes.

44. Can you state to us briefly what are the powers which you are going to seek?—The engineer will be better capable of doing that than I am.

45. Have you had any analysis made of your water, either in former times or recently, which you could furnish to the Commission?—We have had, during the last two or three years, analyses made monthly by Dr. Letheby. Copies of those analyses are quite at the service of the Commission.

46. We shall be very much obliged if you will let us have copies of those analyses?—You shall have them.

47. (*Professor Way.*) These analyses have been for private purposes; they are not published?—Just so.

48. (*Chairman.*) Have any of your directors, or has your engineer made any special inspection of your works and district for any purpose within the last 12 months? You are aware that it has been said that cholera having been rife in the eastern district which you supply it had something to do with the water?—Yes.

49. Are you aware whether your directors, or your engineer, have made any special examination or inquiry thereon?—The engineer must answer for himself. Our directors have not made any special inquiry personally.

50. You are aware that I personally, with Mr. Taylor, made a very complete inspection?—We had two officers from the Privy Council, Dr. Seaton and Dr. Buchanan, who received all the information which we could give them. That was after the outbreak of cholera.

51. That was previous to my investigation?—Yes.

52. And afterwards Dr. Buchanan accompanied me to your board?—Yes.

53. You say, I think, that you are not aware that the directors either made or advised such an inquiry? —They did not instruct any inquiry to be made.

54. Not that you are aware of?—No.

55. Had you any report from your own engineer? —We have had no report from our engineer as to any cause which should have accounted for the outbreak of cholera in our district.

56. Had you any report prepared indicating the character of the works to meet the charges made by the Registrar-General?—The Registrar-General made a mistake in his first statement, and described our works as they originally had been before the alterations in 1852. I myself called the attention of the Registrar-General to it. The engineer likewise called at his office, and pointed out the incorrectness of his statement.

57. Did the Registrar-General admit that he had made an incorrect statement in any of his documents? —Not fully.

58. Did your board ever receive a copy of the report made by myself and Mr. Arnold Taylor?—No.

59. It was not transmitted to you?—No.

60. You did not ask for it?—We have never asked for it.

61. Did you receive a copy of any report made by Dr. Buchanan and his colleague after their inspection?—None at all.

62. Neither did you ask for it?—Neither did we ask for it. I think that we should have done so if we had known that we could have obtained it by asking.

63. Did it not occur to you that public officers would be required to report?—Yes; but we were never told that the report had been made.

64. If it were in your favour or against you, would it not have been of the utmost importance that you should have known what was said?—We certainly have been very desirous of seeing those reports, whether in our favour or not in our favour.

65. Is there anything which you wish to add to your evidence?—There is nothing further, I think, which I could tell you.

The witness withdrew.

COPY of a LETTER from the Secretary to the East London Waterworks Company to the Rivers Commission, referred to in the Chairman's opening remarks (*vide supra*).

East London Waterworks Company,
Office, 16, St. Helen's Place, E.C.

SIR, 22nd October 1866.

I AM instructed by the directors of this company to ask the attention of the Rivers Commission to the case of the River Lee, and the best means of preserving it from pollution.

By the River Lee Water Act, 1855, the water of the Lee, subject to making provision for the navigation (which is invested in an incorporated body of trustees), and the annual payments secured to the trustees, and also subject to certain other rights specified in the Act, are transferred to the New River Company and the East London Waterworks Company for their respective use in the supply of water in their respective districts.

The companies have from time to time expended considerable sums in works for preventing sewage and pollution coming into those channels of the river from which they take their supply, but what has been done leaves very important portions of the river and its affluents (and portions in which the East London Company is far more interested than the New River Company) without any adequate protection, whilst the evil is, from the rapid increase of the riparian population, daily on the increase, and the East London Company is powerless in the matter.

The directors of the company are desirous to increase their protective powers in this respect, and are willing to face a considerable expenditure with that object, but they are advised that they may probably fail in obtaining the concession by Parliament of the necessary powers.

It appears to this board that it is peculiarly the province of your Commission to inquire into the case, and especially desirable that Parliament should, in dealing with the subject, have the aid of a report from so experienced an authority as your Commission.

I need scarcely point out that there is scarcely a river in the kingdom of which so large a proportion of the waters is devoted to purposes which call for protection from pollution, nor one in which so important a population as that located in the East London district is exclusively dependent for its supply. The River Lee therefore would seem especially entitled to the early consideration of the Rivers Commission.

In these circumstances I am to express the hope of the directors of this company that the attention of your Commission may immediately be directed to the Lee, in the expectation that the case must appear to you one in which legislative protection analogous to that given in the last session to the Thames, should, in the next session of Parliament, be extended to the Lee and its affluents.

I am to add that every information and aid which the officers of this company can give to the Commissioners will be at their disposal, pending the inquiry and afterwards.

I have, &c.
(Signed) E. BATES,
Secretary.

G. Lushington, Esq.
Secretary of the Rivers Commission,
Victoria Street, Westminister.

Mr. CHARLES GREAVES (London) examined.

66. (*Chairman.*) How long have you been officially connected with the East London Waterworks Company?—I was appointed their engineer in the latter part of the year 1851.

67. Had you been connected with them previously?—Not at all.

68. Have you been engineer-in-chief for the whole of that time, or did you act under any other engineer in the first instance?—I was appointed engineer-in-chief at that period and have acted so ever since.

69. Who had been the engineer previously to your appointment?—Mr. Thomas Wicksteed.

70. You succeeded Mr. Wicksteed?—Yes.

71. Do you hold any other appointment?—No.

72. Can you state briefly the extent of your works, the points at which you take your water, and the area of ground which you occupy at Old Ford?—The approximate acreage of land property of the East London Waterworks Company held for the purpose of the works at their several stations, viz., Old Ford, Lee Bridge and Walthamstow, and in Tottenham, Edmonton, and Enfield parishes, is four hundred (400) acres.

73. What is the point at which you abstract your water from the river Lee?—The highest point at which we have absolute control of the channels, so as to call them our own, may be said to be Higham Hill or the parallel of Stone Bridge Lock.

74. Whereabouts is that as regards Enfield; is it on the London side of Enfield?—Yes.

75. How much?—Measuring along the valley, about three miles. Measuring along the course of the river itself, it is about four miles.

76. Have you any jurisdiction over the river or its pollutions above that point?—Other works for the diversion of foul water have been constructed, extending to a greater distance from London, and therefore, although we have not jurisdiction, we have influence over the whole of the river from Enfield Mill downwards.

77. You have legal jurisdiction from the point which you have named downwards?—Yes.

78. You have permissive jurisdiction to a certain extent up to Enfield above that point?—Not permissive.

79. Is it by Act of Parliament you have diverted the foul water?—Decidedly.

80. You have legal jurisdiction there?—Undoubtedly, in that sense.

81. Have you any jurisdiction beyond Enfield up the river?—We have no jurisdiction above, except such as might come under the general Acts which are inefficient in such matters.

82. What is the class and character of the works between Enfield and the point where you abstract the water for domestic purposes; is there any intercepting sewer?—Simply an intercepting sewer which discharges itself into the river considerably below the point which I have named as the source of our special channels.

83. In such a manner as not to contaminate your water in any way?—Quite so.

84. How much of the Enfield sewage does that intercept?—The greater part.

85. Anything besides Enfield?—Nothing beyond Enfield northwards, but southwards very largely; the greater portion of the parish of Enfield, the whole of the parish of Edmonton, the whole of the parish of Tottenham, the whole of the parish of Hornsey, and the whole of the two Barnets, and Monken Hadley.

86. To what extent is the Lee a tidal river, as regards the point at which you abstract the water; does the tide influence it at all up there?—No, those

LONDON.

Mr. C. Greaves.

10 Dec. 1866.

points are far above the influence of the tide; the utmost extent to which the action of the tide reaches is between Old Ford and Lee Bridge; the ordinary known limit of the tide is at Temple mills, where posts were erected years ago to show the extent of the jurisdiction of the city; the river is considerably ponded above that, but the tide does not flow upwards.

87. Have you at any point of your works any notorious flooding?—The whole of the valley of the Lee is subject to very great floods.

88. Has it been flooded during the last month?—Yes; the floods have only just gone off.

89. Do those floods reach in elevations so as to get into your conduit?—The conduit brings down flood water. The great flood in October 1857, which was one of the heaviest that we ever had, was up to the top of several of our banks, but the streams themselves were all flood watered at the time.

90. Have you any reservoir room which will enable you to tide over a flood so as to shut out the flood waters and to work without them until the flood subsides?—We have reservoir enough now to enable us to shut out the river for several days.

91. For how many days?—I shut out the river for four days last week. I do not exactly know how far I could go, but I should imagine that I could shut it out for six or seven days if I had occasion to do so.

92. Is the water ever in such a condition that it is advisable to shut it out during flood periods?—It is always advisable to do so when a flood comes on, as a source of economy; it chokes the filter beds so much that it is desirable to shut it out until the river has passed away some of its heaviest suspended matter.

93. Have you sufficient land in your possession to give larger reservoir room so as to shut out the flood water?—I cannot say that we strictly have; we have entered into the purchase of more lands than we have yet made reservoirs upon, but we cannot complete the site for reservoirs without parliamentary power.

94. Will the bills which you have now before Parliament, if they become law, give you a larger area of land which you might use for that purpose?—They will enable me to supply an additional area of about 100 acres.

95. The 100 acres, if turned into water space or reservoir room, will give a very large area of water in proportion?—A very considerable area in proportion to the depth to which reservoirs can be filled.

96. Do you know by inspection the condition of Luton?—Roughly.

97. Does the sewage from Luton go into the river, which water you afterwards take for domestic supply?—Yes.

98. Do you know Bishops Stortford?—Yes.

99. Does the sewage there pass into the river?—Yes.

100. Does the sewage of Hertford also pass into the river?—Yes, the water does, after purification.

101. And the sewage of any other towns above?—There are villages; there are not many large towns. Ware and Waltham Abbey are towns.

102. I assume that you are aware that this Commission proposes to hold a public inquiry at some of these towns forthwith?—I have heard that that is likely to be the case, and I expect that you will do so.

103. Do you think it at all desirable that measures should be adopted, if possible, to prevent the contamination of the waters of the Lee by sewage and foul matters?—Speaking for myself as engineer, and for the company whom I represent, it is a matter of extreme importance that some kind of jurisdiction should be exercised, at as early a period as possible, for the prevention of the discharge of sewage matter into the river, wherever such discharge does ori possible to take place.

103*a*. You have stated that you have certain reservoir room, and you also have filter beds; what is the area of your filter beds?—The filter beds at present in use have 12 acres of sand surface.

104. Do you use the whole of them at one and the same time?—They are all continually in use, with the exception of such as may be under process of cleaning; they are never disused for any other reason.

105. What volume of water do you calculate passes through each square yard of filter bed; what is your mode of calculation for delivery in each 24 hours through your filter bed when it is in good condition?—There is no particular calculation necessary from time to time to ascertain the quantity which is being filtered.

106. But you know what your beds will pass, 1,000 or 2,000 or 3,000 gallons through each square yard or square foot in 24 hours; there is a limit to the capacity of passing water through?—The practical way in which the efficiency or inefficiency of the area of filter bed shows itself is in the depression of the water on the low side. If your filter beds are too small you draw away the water from below because it will not come through fast enough, and it is not desirable to work a filter bed with too much pressure upon it.

107. What is the sectional area of the conduit which brings the water from the river Lee to your filter beds?—The sectional area of the conduit was constructed for 100 square feet; it is filled a little fuller than that measure, and therefore would give an excess on 100 square feet.

108. Of what length is that conduit?—The length of that section is a mile and a quarter.

109. Is the bed of the conduit pitched, or is it the earth of the district?—It is the earth of the district.

110. It is not pitched?—It is not.

111. It is a simple open canal?—Yes, with puddled sides, and formed of the ground at the bottom.

112. Is the puddle so placed that the water has action upon it?—No, the puddle is in the centre of the bank.

113. Is the bed gravel or soil?—It is partly soil.

114. At what velocity do you ordinarily draw the water through that conduit?—The average velocity would be 20 feet a minute.

115. That is about one foot in three seconds?—It varies according to the time of the day, from midnight to midday.

116. Is it a velocity which disturbs the fine particles upon the bottom or the sides, or not?—Far from it; the tendency is to deposit, no abrasion takes place at all from velocity.

116*a*. Do you know what the surface fall is in that mile and a quarter; can you level it?—There is a fall, but it is slight; it would require very nice levelling to ascertain it.

117. How frequently do you find it necessary to clean your filter beds?—Before we constructed settling reservoirs the filter beds required cleansing more frequently than they do now; at present they are cleansed about once in five or six weeks on the average of the year, but the rate of cleansing will depend upon the turbidity of the water and the tendency to vegetate, which differ at different times of the year.

118. According to your experience would your filter beds require more or less cleaning in a wet than in a dry summer?—I should think that a dry summer would create the greatest amount of growth. A balancing of two conditions is not very easy to make; it is a question of degree in each case which one could not be critical about.

119. Is the vegetation which bothers you upon your filter beds more prolific in warm weather or in wet weather?—It is more prolific in hot or warm weather, with a short flow in the river.

120. Do you know the botanical name of the vegetation which so troubles you?—I have not the name of it, we call it "silk weed."

121. What do the navvies call it when they take it off?—They call it "blanket."

122. Did you ever ascertain the weight which you take off at a cleansing?—Never.

123. I assume that it is mixed up with the sand?—Yes; there is very little occasion to take sand off, but

the shovel, which has to be used for taking off the mud, necessarily brings a certain quantity of sand with it.

124. In cleansing the filter beds, are any fish or fish spawn found entangled with the scrapings?—We find a few fish occasionally; fish spawn I do not know of.

125. Does the river Lee contain fish above the point at which you abstract the water?—At the point at which we abstract the water there are numbers of fish in the river.

126. Have you any grates or screens or apparatus for keeping out fish or floating vegetable matter from the river Lee itself at the point at which you abstract your water?—Yes, there are screens erected in front of the channels by which the filter beds are fed.

127. At the junction of the conduit with the river Lee have you any screens?—No.

128. Then anything which the Lee contains is free to come into the conduit at that point?—Yes.

129. And to be brought down towards your filter beds?—Passing towards the sluices where the river is let in there are always accumulations of weeds which are floating down the river; there are many ways in which the trash coming down the river is diminished before reaching the inlet.

130. If there were any dead dogs or cats, or floating carcases upon the Lee, could they float into your conduit?—Possibly at the upper parts, but they would meet with interruption before they got far.

131. Have you ever seen such refuse brought into your conduit?—I have never seen any dead animal in the channels since the present channels have been made. I do not at the present moment recollect ever seeing one.

132. I suppose that your duties do not frequently take you along that channel?—Frequently; if it were a common thing I should have known of it.

133. But I suppose that the river Lee, like all other open channels, is liable to that form of abuse?—People will go and drown dogs at all points of the river, it is utterly impossible to stop it at all points.

134. Are you aware whether there is much bathing in the river above the point where you abstract your water, or is there any prohibition or any supervision to prevent it?—There is bathing here and there, but I think not to any great extent.

134*a*. Have you any means of preventing any bathing near your conduit or reservoirs?—Our own private conduits are fenced to a certain extent.

135. And I assume that you would prevent it?—Of course anything in the form of bathing would be strictly prohibited.

136. You would exercise the provisions of the Waterworks Clauses Act?—Immediately; or we should carry out absolute prevention by taking care that persons should not come there to bathe.

137. In your filtering operations are you troubled most by the growth of the vegetation, or by the actual deposition of mud which is strained from the water in the filtering process; which of the two things bothers you most, the vegetation or the actual sediment of mud?—I should think that the trouble in the operation is about equal. I have never been able critically to decide between the influences of the two.

138. If that vegetation remained long enough would it become offensive?—Not in the filter beds.

139. Not in the water?—Not in the water.

140. Does it become offensive when it is cleansed out and thrown in a heap?—When it is accumulated and thrown in a heap and remains there for any length of time, if the weather is warm and that heap is broken down for cleansing, there is an odour from it which is excessively disagreeable, but in ordinary weather it is not particularly noticeable.

141. That I suppose you cart away?—The filth which is removed from the sand is carted away.

142. You have twelve acres of filter bed in use and your pure water reservoirs from which you pump; have you any conduit or open reservoirs in which water is stored, or into which you can bring water, which are not regularly in use?—I have reservoirs still in existence which were originally made as depositing reservoirs where the simple water is received from the river; those reservoirs until lately were in a position to be drawn upon in the way which you mention.

143. Are those reservoirs capable of being filled by a conduit or by a pipe, would they be filled by sluices directly connecting with the Lee, or by what means would they be filled?—They were capable of being filled by a sluice connected with a disused canal, a canal which was in use as the company's principal line of conduit previously to the year 1852.

144. And that conduit and those reservoirs exist now?—That conduit and the reservoirs exist at present.

145. Are they now full of water?—They have been absolutely severed.

146. Are they full of water?—One of them is considerably depressed and has been emptied, the other one is not full.

147. Are they now in a position so that you could connect them with your lower pumping engines?—No, not now at all.

148. When where they disconnected?—In the last autumn.

149. Could they have been connected this spring?—One reservoir could have been drawn upon this spring.

150. To your knowledge were they or were they not drawn upon this spring?—A small quantity of water was taken out of one of them.

151. Then the water from one or other of those open reservoirs was drawn upon this spring?—Yes.

152. Can you give us the date?—I have not the date.

152*a*. Was it drawn upon by your order?—Not precisely, but there was an implied sanction.

153. For what purpose was it drawn upon? Was it because you were short of water in your store?—I should think that it was because the foreman thought so.

154. He thought that it required it?—Yes.

155. Would he do it without consulting you?—Yes, if I were not present. I lost my foreman early this year; he died quite suddenly of apoplexy, and I had to appoint a new man, and in giving him discretionary instruction as to how he was to manipulate the water, I described this possibility as something which he must keep in mind, rather than suffer an accident, and so I suppose he may have acted in that sense.

156. Do you know about the date when those reservoirs were last drawn upon? Was it before the outbreak of cholera in the east end of London?—I have not the date. I cannot answer that question now.

157. Do you know whether it was or not before the outbreak of cholera?—You mean the last occasion that they were drawn upon?

158. Yes?—I cannot say.

159. Do you remember the period of my visit?—Quite so; it was I think on the 2nd of August.

160. Have they ever been drawn upon since that visit?—Certainly not.

161. Then it was previous to that visit?—Certainly.

162. I suppose that the cholera had been prevailing a month when I visited you?—Yes.

163. Then the probability is that the reservoirs had been drawn upon previously to that time?—Probably June was the latest date, but I cannot say.

164. You did not think it of sufficient importance to ascertain that fact when that charge was brought against your company of supplying impure water?—I certainly did inquire into it, but I cannot give the date now.

165. At this time you say that it is impossible to connect with those reservoirs?—Yes, we have made a barrier.

166. Have you any power to use that water now, if you thought proper, by sluice or by any other means?—No.

167. If your present lower reservoir, the pure water basin, were pumped dry or were run dry, is there no filtration through the subsoil from the old reservoir works to the pure water basin?—None whatever.

LONDON.

Mr. C. Greaves.

10 Dec. 1866.

168. What is the relative level of the bed of the pure water basin as compared with the open basin, is it higher or lower, or about the same level?—It is about the same level; it may be a trifle deeper. The river intervenes between the pure water basin and the open one.

169. Then you do not imagine that any subsoil filtration could affect it?—I do not imagine so.

170. Is the bottom of the reservoir pitched?—The bottom is the ordinary natural bottom covered with gravel.

171. Are there any springs in it?—No.

172. When it is empty are there no ground springs?—No; I do not know that it is absolutely tight.

173. Is it all a gravel subsoil there?—No; the greater part of it is the London clay.

174. Then you would have no springs there?—None whatever in the clay.

175. Would it be difficult to give us about the date of the last communication with this open reservoir?—I will find you an approximate date.

176. And do you think that you could give us about the volume of water pumped or the length of time that you used it?—I could do so.

177. What are those open reservoirs filled from, are they filled from the new conduit or from any other connexion with the Lee?—They were filled in one way by the overflow of filtered water from the special filtered water basins. They were also capable of being filled through the line of the now disused conduit, which was a special conduit up to 1856.

178. Was that conduit capable of taking water at a lower point than the new conduit which supplies the filter beds above?—I suppose that it was capable in a certain sense, because every opening which you have as an outlet may possibly be used as an inlet.

179. Could you take water from the river Lee below the point of discharge of the intercepting sewer at Enfield?—Water could have been let in.

180. At a point below the works which you have for separating the sewage of the places which you have mentioned to us from your upper conduit?—Yes, water could have been let in.

181. Do you know whether it was so let in or not?—I cannot know absolutely; it is impossible to know absolutely, but I have no suspicion that it was.

182. Why did you abandon those old works; that is to say, why did you abandon their use and yet retain them?—They were abandoned because the system of filtration, as a matter of course, put them out of use, then they were not applicable to any other purpose, and I thought myself more justified in keeping them full than I was in emptying them, considering that the question of quantity was at times of such importance; with reference to accidents, that it was advisable to keep reservoirs which were already constructed and which I could not apply to any other purpose, to meet such necessities as might arise.

183. Your company carried out the filter beds, and the new conduit, and the fitering arrangements in compliance with the requirements of an Act of Parliament passed in 1852?—Strictly so.

184. That was your purpose and intention?—That was the course of action.

185. That being so, do you think that it was complying with the spirit of the requirement to keep reservoirs which you could use which could not filter the water, would it not have been advisable in your opinion to have abandoned them entirely and utterly?—Perhaps it would. My judgment at the time was, that it was more advisable to keep them.

186. What is your present engine power?—From 1,100 to 1,200-horse power.

187. Did your company use engine power from the first commencement?—Yes; they never had any other means of distributing water.

188. I thought that perhaps in the first instance they might have distributed it to districts which were within reach of gravitation?—Not at all. The company's position, when established, was, under parliamentary power they were authorized to take water out of the Lee, but they were prevented from taking any water but tidal water.

189. Did they pump by steam, or by water power?—The first power erected at Old Ford was steam power, but by the works which they acquired by purchase also at their first establisment at the West Ham Waterworks, they pumped by water power.

190. Do you retain that water power?—The West Ham Waterworks have been discontinued for 15 or 16 years.

191. Was it a tidal wheel?—Yes, there was a small amount of tidal water power, but it was principally river water power.

192. Do you know what water was consumed in the first year of your operations?—I have rough notes which I have drawn into a series for my own use, but I cannot say that it is known with any precision; the early engineers did not keep any correct records of those things, or if they did, they have been lost.

193. What volume of water do you now pump?—It is now about 20,000,000 gallons.

194. What height do you lift the water?—The average lift may be reckoned as about 111 or 112 feet from Trinity high-water mark.

195. What was the character of the mains first used by your company?—I am not aware that the East London Waterworks Company ever laid any wooden pipes of their own, as a proper work; they had such apparatus at the first, but I imagine that it was for the repair of previous wooden pipes.

196. Then they inherited a system of wooden pipes?—They inherited several lines of wooden pipes which had been laid down by the owners of the Shadwell Waterworks and the owners of the West Ham Waterworks, in previous years.

197. Then your company began to lay cast-iron pipes when they purchased the works?—So I have been informed.

198. Had they flange joints?—Yes, put together with bolts, but with a very small number of bolts, as compared with what we should do now.

199. Have you any of those pipes now in use?—I believe that there are a few on one line of pipes not far from where the West Ham Waterworks were.

200. Have you disused all the wooden pipes?—Yes.

201. What were the first house connexions made with; were they made with lead?—I imagine with lead.

202. What are your present connexions?—With lead; lead is the best.

203. Did you ever try wrought-iron?—Yes.

204. What form of joint do you now use in your mains?—Spigot and socket, and lead for all the larger pipes, and iron rust cement for the smaller pipes.

205. What is your largest diameter of main?—Forty-two inches under pressure.

206. What is the size of the smallest?—The size of the smallest main is an empirical point. I do not generally call anything a main under six inches, but still we have some pipes which are here and there used as mains which are only five inches, but those are exceptional. In making up our account we call all over six inches, mains, and all below that not mains.

207. What length of mains have you?—I cannot answer that question off hand, but I can give you the figures probably up to Christmas 1865.

208. What was it then?—I should think 500 miles altogether, for mains and services.

209. What should you call "services"?—Three inches, four inches, and five inches.

210. By the word "services" you do not mean the communication pipes?—No, I mean iron altogether.

211. Is the report by Mr. Austin to the Board of Health in 1852, correct so far as it goes, as applying to that date?—I think so.

212. And with it there is a plan of the area over which you supply?—That plan is correct.

213. But you have extended within that area your means of supply; you have multiplied your customers?

—We have multiplied our customers; we have filled up vacant places; a great many districts then unbuilt upon have since been built upon, and we have spread further into the country.

214. You are now supplying 20,000,000 gallons per day; to what limit could you go; could you supply 30,000,000 or 40,000,000 gallons per day if you had a sale for it?—If I acquired the water I could sell it; I have not the means of supplying 30,000,000 gallons a day at present throughout the year.

215. What volume could you take per day from the Lee with your present means; are you at the extent of it with your 20,000,000 gallons?—No, I am not at the full extent.

216. What would the Lee afford you per day; what would be the probable limit which you could set from the Lee?—There have been times when I have been very short.

217. Even with your present demand?—Yes.

218. Then if London goes on increasing the population must not hope to get very much more from you than you are now giving them?—We benefited our position by the construction of storage reservoirs, of which we had none worth naming at all, until within the last five years; we merely helped ourselves from the river as it flowed, and took things in a state of nature. Any river of such dimensions as the Lee has a great excess of water during a very large portion of the year, and if that water is well stored the supply may be very considerably extended, but without storage and subject to such years as the year 1864, the works are in considerable peril.

219. Will the bills which you are promoting give you additional storage?—An additional 100 acres is covered by one of those bills, and the other bill seeks power to draw 10,000,000 gallons daily from the river Thames.

220. At what point?—Sunbury is the name of the parish where the supply is proposed to be taken out of the river.

221. (*Professor Way.*) Mr. Bates said that you would give us a better account of these bills than he could?—I shall be happy to do so.

222. (*Chairman.*) You propose taking a supply from the Thames above Teddington lock?—Yes, some little distance above the point where the other companies are now taking their supply.

223. If you are met in Parliament by a proposition to bring in water from North Wales, or from anywhere else, upon the plea that you cannot give a sufficient volume, that will be your reply. You are aware that very large schemes for supplying London are talked about?—Yes.

224. And that it has been stated that one of the reasons for those schemes is because a larger supply is required. If you are at the limit with the Lee now in a dry season, and as London has not come to its limit, the question may be asked, where are you to get the additional volume from? and your reply is that you will take 10,000,000 gallons daily from the Thames?—I am proposing to extend our life by helping myself to 10,000,000 gallons daily from the Thames.

225. If you get it?—If I get it.

226. But in the event of your not getting it, would it be possible by works within your reach to get a larger volume from the Lee than you have hitherto got?—I could not execute works which would enable me to make the Lee good for 10,000,000 gallons per day additional, more or less.

227. That is to say in dry weather?—Just so.

228. Probably not by works on your own site, but are there no sites for reservoirs in the upper valley of the Lee?—I do not think that it could be done to the extent of 10,000,000 gallons a day. There are difficulties in the way of finding sites for reservoirs, and suitable soil to make them upon, and suitable rivers to fill them with.

229. Do you know Dr. Angus Smith's patent for varnishing cast-iron mains?—I am acquainted with it.

230. Have you used it?—Not at all. We do not find any necessity for the use of anything of that sort with pipes for the supply of chalk water, or water at all impregnated with chalk; we find that the chalk water puts an enamel on the pipes inside in a most beautiful manner, and which you can hardly imitate; but as a practice, I have had all the pipes which have been sent out for laying lime washed inside for the last 10 years.

231. Is that common limewash?—Yes.

232. Is it sized at all?—No, it is simply a solution of ordinary chalk lime.

233. It is not Portland, or any hydraulic lime?—No; I find that occasionally the pipes when fresh laid become rusty if not drawn upon by any great number of houses, and that the water becomes quite bad, and I find that whitewashing the pipes inside entirely or almost entirely prevents that.

234. Is your supply at present constant or intermittent?—It is a mixture of both.

235. Which portion is constant?—I cannot answer the question strictly, but I suppose that all the mains from 200 to 220 or 230 miles are permanently charged. All large consumers, trades, and manufactories are supplied from them, and they are all of course on constant supply.

236. As regards that portion which is intermittent, how is the intermittent period regulated? Is the supply regular every day, and if so, at what periods of the day?—It is all worked by book; the supply is daily throughout the whole district, excepting such parts as have a constant supply; every day's work is alike, and the work is performed to strict order by the turncocks, who have charge of the letting on.

237. Is Sunday a day with you?—We do not give a Sunday supply to those houses which are supplied intermittently; we have a large number of domestic houses which are supplied on the constant system in addition to the trades and manufactories which I first mentioned.

238. Did you waive that objection to a Sunday supply, and establish it during the prevalence of cholera?—Yes; we gave a very considerably increased supply on Sundays during the prevalence of cholera, but it was not done at random, but with discretion, where we thought it most required.

239. Where the districts are intermittently supplied, with whom do you treat, with the landlords of the lowest class of houses, or with the tenants?—The lower the class the nearer we like to get to the landlord.

240. How is the mode of supply arranged? Do you supply a cistern or tank, or is it by an open stand pipe?—In some courts the water is laid on house by house.

241. Each separate house having a tap?—Yes, and although it is a court, the water is laid on as if it was a street. There are many courts where the water is laid on with a single stand pipe, which is on the intermittent system; the stand pipe being turned on for a definite length of time. There are many other courts where the water is laid on upon the constant system with an apparatus which enables us to control or to prevent inordinate waste.

242. In the courts where an intermittent supply is given, and where the stand pipe is, say, an inch pipe with a turned neck at the top; is there any control as to the waste from that pipe if persons are not catching the water?—Any account which I could give you would not apply to all the courts; they are in all kinds of states and conditions, bad and worse, but we endeavour to prevent a continuance of such things as standpipes without any power of control at all. I am, however, afraid they do exist.

243. For how many minutes is the supply given, 60 or 90?—It is not nearly so long.

244. You turn the water on for a certain length of time?—Yes; say for about half an hour in the courts.

LONDON.
Mr.C.Greaves.
9 Dec. 1866.

245. For whatever length of time the water is on, if there is not an individual catching it, is it necessarily wasting?—Yes, if there is no tap.

246. Are you aware whether there are any cases in which there are no taps?—I think, not many. There may be a few, but these things are in such a fluctuating condition, being repaired and getting out or repair, that it requires the attention of several men to maintain the fittings in anything like a proper state.

247. Are the fittings supplied by your company?—The company themselves supply nothing whatever beyond the iron pipe in the street.

248. Then any person wishing to become a tenant of the company must make application and give notice of his purpose to connect; would he make the connexion himself, or would it be done by your workmen?—We make the connexion ourselves; we do not allow anyone to touch the iron pipes, but the connexion is made by our men with the material belonging to the consumer, and with the apparatus of drills and screws belonging to us, at the expense of the consumer.

249. Do you at all dictate the form of apparatus by which consumers shall draw from your works, whether it shall be an open swan-necked pipe, or whether it shall be a stand-pipe, self-acting, or whether they shall have a cistern, or shall be supplied in any other way?—We regulate more or less precisely the fashion of the laying on of every house, and we record it.

250. I saw those swan-necked pipes of an inch bore in some of the courts running full open, and as long as the water was on, there was nothing to check the waste?—It is very likely. I cannot state how many there are, but it is certain that there must be some, because there is no way of making it otherwise. The robbery of brass taps is so frequent that it is utterly impossible to maintain the presence of them at the end of every pipe in every court.

251. Are all your service taps brass taps?—Yes.

252. Have you seen any of the iron service taps recently made by Mr. Lambert?—Yes, and I think we have tried them; but so far as my judgment goes they are not desirable things to use.

253. Do you know how many fire cocks there are on your mains?—I could furnish you with the number of fire plugs which we have. We have not fire cocks, except for private houses. (*The witness subsequently furnished the information, and it will be found printed at the end of his evidence, Appendix No.* 1.)

254. Are they the old fashioned plugs?—The ordinary wooden plugs.

255. Are they provided by the company?—Yes, at the company's expense.

256. Are the fire police at liberty to attach hose to the main at any point where a fire may occur without application to you or your turncocks?—Quite so; they do what they choose to do, we have no denial; they expect the presence of a turncock, but the police are very careless in giving notice to the turncock of a fire which has broken out. If the turncock is there he is ready to draw the plug or to give assistance.

257. Are either one or other of your works in operation so as to give a high pressure in that respect?—Always.

258. What height would the water rise through a hose from one of the plugs in the centre of your district; would it play to any great height without the intervention of a fire engine?—It would depend upon the time of day or night, and the position, whether it is well placed, and whether it is in the neighbourhood of a considerable pipe, or whether it is up a long series of small courts with small pipes, but 25 or 30 feet is a moderate height.

259. Would your service, without the intervention of a fire engine, give you a hose pressure of 25 or 30 feet?—Generally in most places; in many places a great deal more.

260. Is the hose used upon your services without the intervention of a fire engine?—Constantly. The parish of West Ham very seldom use a fire engine.

261. They have a fire engine, and they have a fire apparatus?—They have, but they put out a great majority of their fires by applying the hose through the use of what is called a dummy direct to the pipe.

262. Have you many dead ends on your branch mains?—A good many I should think.

263. Have you any arrangement for washing them out?—In laying a pipe, if the street is finished and the upper end has not to be extended, we put what we call an end fire plug in the line of pipe, that is, a fire plug near the end, the extreme end is generally capped, and when we think or know that there is any occasion for washing the pipe we discharge water through it into the street.

264. You draw the plug?—Yes.

265. As a rule, do you find the water bright or not in your dead end pipes?—The water is now generally bright, but there are occasions when there is an accumulation of sediment at the dead ends which must be blown out, by washing out. The mains are generally looped together, whenever it is possible, so that parts may be shut down for the purpose of making new connexions without interfering with everything.

266. Have you reason to believe that you have much or little leakage from your mains?—I do not suspect any leakage at all from the mains. I think that the mains are quite tight.

267. Have you any ready means of ascertaining where the leakage is, if there is one?—No; if a leakage takes place into the sewer, it may go on for a length of time without our having any knowledge of it, except the knowledge which we might have of an inordinate increase in the flow, but in 20,000,000 gallons a day that would not show itself.

268. Have you at any point any incrustation in your mains?—No.

269. You never have anything like this (*producing a piece of pipe deeply incrusted*)?—Never. I have never seen anything of that sort from chalk water. I should imagine that that would be a deposit from boiled water, and not from cold water.

270. That is a part of the supply for an ordinary city service, and it has been 38 years in use in the city of Bath?—We have nothing of the sort. I took up several of the pipes of the West Ham service in 1862, which had been there since 1762, and there was not the eighth of an inch incrustation anywhere.

271. Have you bursts occasionally in your mains?—Occasionally.

272. Do you find that bursts take place after a main has been working several years, or is it generally in the first year of its life?—Bursts generally arise from defects in pipes, and therefore may be probably expected to be proved in the first year's use, but bursts sometimes are occasioned by frost, or by weakening occasioned by frost.

273. Are your mains laid at such a depth as to come within the influence of frost?—Yes; when frost is extreme.

274. What is the greatest and least depth of covering for the pipes?—The rule is, two feet above the barrel of the pipe, but there are cases in which it is frequently less.

275. Have frosts touched them at that depth?—Yes; in certain cases. In the last very cold weather which we had, several of the pipes burst. A particularly cold wind in that winter seemed to catch the ground in certain places, and the frost went very deep.

276. Would an open end so as to give a motion to the water in the pipes, be an advantage?—I do not think so.

277. Was there anything to prevent your laying those pipes at a greater depth?—On the average, 2 feet is deep enough. The number of breakages is not great, and the depth at which pipes are laid has to be regulated for the convenience of the consumer's pipes. The expense is generally increased by going to a greater depth, and that has become the depth which we have considered sufficient.

278. Do you know how many gas companies

there are in your area? Is there more than one?—Yes.

279. Are you at all bothered with their pipes interlacing yours?—We have had to grumble and squabble and fight several times with the gas companies on account of the proximity of their pipes.

280. Have you any rule as to the nearness at which water pipes and gas pipes should be laid?—We have clauses in our Act of Parliament which restrict them from coming within a certain distance, and which orders the way in which pipes should be put together so as to escape as much as possible the chances of contamination.

281. Do you use puddle, or cause them to use puddle, if they come near you?—No, we have never done so. Of late years the contaminations which have commonly occurred have been very few indeed, scarcely any.

282. Are you aware that in some parts of the metropolis, if not in yours, the water pipes and the gas pipes literally interlace each other?—I am aware that they do, and I do not see how it can be otherwise.

283. The external surfaces of the pipes are in contact?—I dare say that that is so, but with mains and pipes constantly charged there is not much danger, it is in pipes which are used for a daily supply, that the danger exists.

284. Where the supply is intermittent would there, or not, be danger?—There would be danger. I have heard of gas burning at the mouth of a supply water pipe.

285. Then it forms a gas pipe as well as a water pipe?—Yes.

286. Are you at all troubled with blown joints?—Not much.

287. I suppose you occasionally have a blown joint?—Occasionally, especially if there is an excess of pressure. We have had a little trouble under those circumstances, but with our ordinary pressure, which is by no means an excessive one, we are very well as to joints. I should have to find fault with our pipe laying contractors if we had any frequency of blown joints, but we have not.

288. Do you lay by contract?—Yes; entirely.

289. What depth of lead would you give to a six-inch pipe?—About two inches and a half, or not much less.

290. Do you think that an intermittent supply is more wearing upon joints and pipes than a constant supply, or otherwise?—With our pressure I do not think it makes any difference. There is no stress which need be talked about with a pressure not exceeding 120 feet.

291. Do you supply the whole of your water by means of a stand pipe, or do you ever pump directly into the mains?—It is all pumped directly into the mains.

292. Does not the opening and shutting of the valves affect your engines?—Not in the least. If a maincock in the neighbourhood of the works on the principal line of pipes were opened or shut it would quicken or slow the engines, but such openings and shuttings as those, are done by a man of ours especially employed.

293. Your engines are balanced?—Yes, they are all balanced against a certain height of hydrostatic pressure. They are upon the Cornish principle.

294. Have you safety valves to blow off when the pressure is exceeded?—No.

295. Do you know what number of houses you serve?—The most authentic return is that made to the Registrar-General monthly, in which the number now somewhat exceeds 90,000.

296. Do you know the volume which you supply for trade, and the volume which you supply for domestic purposes?—The volume of water delivered for trade purposes being entirely delivered through meter is known to a nicety.

297. Then you will probably let us have the number of meters, and the volume supplied through them?—Yes.

298. What is your price by meter?—There are three prices.

299. Is it according to the scale in your last Act of Parliament?—Yes.

300. Does that Act also regulate your domestic supply?—The domestic supply is by a per-centage on the annual value.

301. Is it 5 per cent.?—Yes.

302. Have you a separate supply for waterclosets or soil pans?—There is a separate charge.

303. That is all stated in the schedule?—Yes.

304. A copy of which schedule we can get?—A copy of which schedule we can furnish you with.

305. It will also state whether you make a separate charge for watering gardens, or watering streets, or any purpose of that sort?—Yes.

306. Do you charge for the water supplied for watering streets?—Yes, that is all done by meter.

307. Have you any idea how many waterclosets and soil pans there are in your district?—I have not the precise knowledge, but I have an approximate knowledge of the number of closets which exist in the houses which are supplied.

308. What is that number?—You must allow me to refer to papers for that, because these are not subjects which are often brought forward, and it is a matter of statistical knowledge which can only be furnished by looking particularly into it.

309. We should very much like to have it if you could tell us the number within 1,000?—I do not think that I could give it to you all over the area, but I could select a district vestry or a board of works, and I could tell you how many houses of the total number of houses, within that district, had water supplied to closets, and how many had none, because where there are closets and no water supply, we have not made an account of the closet pans. (*The witness subsequently furnished the information, and it will be found printed at the end of his evidence, Appendix No.* 2.)

310. But if you have 90,000 private consumers you would know whether you have 20,000 or 30,000 waterclosets?—Yes.

311. Would they amount to 40,000?—I should think more.

312. We do not care even to 1,000, but we should very much like you to give the number in round figures?—I will do my best to furnish you with that information. In 78,710 houses situate within the metropolitan district of the company there were, at Christmas 1865, 36,214 having water fittings to the closets.

313. Do you know anything about the sewerage which is carried out in your district? Have you any plan of the main sewers?—I have no plans but the general plans. We have laid down on such maps as we use the lines of the main sewers, but we have never endeavoured to lay down the lines of the smaller sewers on a system generally.

314. You keep, I presume, for your own purposes, separate plans of your own mains?—Precisely, both of the mains and of the services.

315. On what plan are they recorded?—On the 5 feet ordnance plan.

316. Do you use the skeleton ordnance plan, or the other plan?—We use the detailed 5 feet ordnance plan. It requires hundreds of sheets to fill up the whole system of piping, and we keep it posted up as early as possible. I like to correct it every year if it can be done.

317. What meter do you use for sale?—We have been entirely using Siemen's patent.

318. Do you find that it answers to your satisfaction?—I have every confidence in it.

319. In the event of its measuring intermittently would it not measure air as well as water?—If air were blown through it would revolve, and the index would count, but all meters are on constant supply.

320. Then the only time when they would be on intermittent supply would be in the case of repairs

or of additional services being put on in your district?—Yes, if the main was emptied there would be a possibility of air being blown through the meter.

321. And the parties would have to pay a little extra?—Yes.

322. Do you know the number of meters which you have in use?—I think that is 1,200.

323. How long have you adopted the meter system of supply for private purposes?—I think that we began the meters in 1855.

324. Do you find that system advantageous?—In every way.

325. Is it equally satisfactory to the consumer?—That is rather a difficult question to answer. The consumer wants to get the most which he can for the least money.

326. At all events he is supposed to get what he pays for, and not to pay for more than he gets?—Certainly, and he does not pay for more than he gets; and in the case of any consumer who treats with us on the common ground of honesty we have no difficulty. He admits that the meter is the fairest mode and far more fair than any estimation which can be made by the judgment of an officer.

327. What was the mode of supplying for trade purposes previously to the introduction of the meter?—The duty of estimating the quantity was committed to a special officer whose department included that work and he had to get at a knowledge of it in the best way that he could, and the methods of doing so were most imperfect and most inefficient.

328. Did he apportion the bore of the service to the requirements or was it a mere guess?—In many cases he tried how much was delivered at a house with the pressure and with the sized pipe. In many trades we got into the system of estimating according to the work done. Brewers were supposed to require a certain quantity of water to brew with, and the same with spirit manufacturers. If dyers turned out a certain quantity of goods they were supposed to use a certain quantity of water, and it was the same with all of them formerly more than now. Within certain limits there were the means of knowing what amount of goods they turned out, and a certain quantity of water was allowed to so much work done.

329. Do you now supply water for brewing?—Largely.

330. And for dyeing?—Yes.

331. Where are the dye works situate?—In various parts of the district.

332. What kind of dyeing is it?—I can hardly describe it to you.

333. Is it in connexion with Spitalfields weaving?—Yes, silk dyeing. They are small trades, they are not very large.

334. But you do supply dyers?—There are several dyers on our books.

335. And for condensing purposes for distilling, you supply water?—Yes, very large quantities, and also for condensing purposes, for sugar baking, for the production of vacuum.

336. Do you also supply water for steam engine boilers?—Yes, largely. We supply water for any purposes for which the people can use it, and since the adoption of the meter system, it is of little consequence to us how they use it, or for what.

337. Would it be difficult for you to let us have an approximate list of the different trades for which you supply water; if you have 10, or 15, or 20 trades of the same kind. I do not want to know how many cases there are of each trade, but I want a statement of the kinds of business carried on for which you supply water by meter?—I think that we can give you a pretty near account of it. (*The witness subsequently furnished the information, and it will be found printed at the end of his evidence, Appendix No.* 3.)

338. (*Mr. Harrison.*) We should like to have the quantity of water used for the production of the kind of material?—I do not think that we could do that at all.

339. I thought you said that it was the duty of a special servant to determine the volume of the water used?—That was 10 years ago, but I do not think that those data would be reliable.

340. (*Professor Way.*) I suppose that more water is used in your district for trade purposes than in any other part of London?—No returns since 1852 have been at all minute. We do not know what the quantities used in other districts are, but we imagine that our supply for trade purposes is as large as any.

341. (*Chairman.*) Do you at all supply by meter for domestic purposes?—A few houses.

342. Have you ever made any experiments yourself to test what is the daily consumption for domestic use? If you are told that in a town the domestic supply is 20 gallons per head of the entire population, do you believe that any such volume is legitimately used?—I believe that that is what is used in our district.

343. Used or wasted?—Used or wasted, I believe that it goes to the domestic supply.

344. Did you ever set up any experiments to find out what would be a legitimate use, and what would be an improper use?—Yes, I have investigated the matter a good deal. The experiments which I have made are only such as metering a district and dividing the quantity supplied by meter by the number of houses in the district.

345. What did the result turn out to be in that case?—When we had measured various districts some of them were bad and some were good, some of them gave much more than we ought to be delivering and some of them scarcely gave enough.

346. (*Professor Way.*) In that experiment, I presume, the parties would be paying by meter?—No; it was a meter put in at my own instance to obtain a knowledge on the subject.

347. Did they know that the water was being measured?—In some cases they did. In some cases where the quantity was excessive we had to tell them that they were using a great deal more water than they should use, and their first inquiry was, "How did you know it?" and that found out the experiment.

348. The experiment would have some elements of fallacy?—It is a very difficult thing to know precisely.

349. (*Chairman.*) Whatever the volume of water is, which you use, you may make a rule of three sum of it with regard to the coal you use, the volume representing the coal or the coal representing the volume?—According to the condition in which the engines are; there is a pretty uniform correspondence between the amount of coal and the water.

350. What is your present annual consumption of coal?—About 6,000 tons per annum.

351. What coal do you use?—Entirely small Newcastle coal.

352. Do you find the coal yourself?—No.

353. At what is it laid down at your place?—The present price is 12*s.* 6*d.*, those are the siftings of house coal.

354. What is called slack?—We call it slack, but it is not correctly called slack, because slack in the North means some inferior stuff which comes from the shale.

355. (*Mr. Harrison.*) Is it what in the North is called nuts?—Nuts are too coarse, but we use the fine siftings of Firsts and Seconds.

356. (*Chairman.*) Do you think that 6,000 tons of coal per annum represent the lift of 20,000,000 gallons of water per day 112 feet?—It would go on for a few years correctly, if the engine is not suffering any damage, or has not any great improvement, and I suppose that it would remain pretty uniform.

357. Have you any tabulated record of work done per month, or per cwt., similar to that which is kept by the Cornish engineers?—Yes, I have it for some of the separate engines, and also for the whole power which is in use.

358. Could you let us have an extract from that

record showing the results of your own experience?—I think that I could make a table. Taken in the gross it would be mixed up with a certain amount of water power, and it would have in it some steam power doing special work. I could give you an approximate idea on the gross.

359. Do you ever require to cleanse the open conduit leading down to your filter beds?—Yes, it is desirable to cleanse it frequently.

360. What is taken out of it when it is cleansed?—Deposit mud and growing weed.

361. If it were made into a tunnel and the light shut out, and pitched the whole length, do you think that it would bring down cleaner water?—No, I do not think that it would improve the water at all. Until water is filtered I do not think that it is advisable to enclose or cover up or shut up water. I think that the action of the light and air upon it produces more benefit than detriment.

362. Have you had any experience of enclosing water, and seeing its condition after such enclosure? Have you ever to cleanse or examine the cast-iron conduit which connects your upper filter beds with your lower pure water beds?—No.

363. Have you any ventilation upon that line of pipe?—There is a ventilator at ever furlong.

364. Was it ventilated when you first laid it down?—Yes.

365. Of what diameter is that main?—Four feet.

366. And of what length is it?—Two miles.

367. What fall has the water? What volume can you deliver out of it into your lower pure water basin?—I can deliver 20,000,000 gallons a day in 24 hours.

368. Have you any filter beds at all in connexion with your lower pumping engines?—We have only one system of filter beds, and they are exclusively situated at Lee Bridge.

369. Your twelve acres of filter beds are situated at Lee Bridge?—Yes.

370. Your service reservoirs for a portion of your supply are situated at Old Ford?—Yes.

371. What area of reservoir have you at Old Ford?—The upper surface is two and a half acres. That is when the reservoirs are full.

372. What is the cube in gallons, or in feet?—I have not the figures by me. The form is very irregular.

373. You have no filter beds at Old Ford?—None whatever.

374. The whole of the filtered water must come from the upper filters?—Yes.

375. Then, when you are supplying filtered water it is essentially one and the same water at the upper and at the lower works?—Yes.

376. Have you any division in your services in the district which you supply so that the lower water and the upper water are received separately?—None, except by the force of a self-acting arrangement. The water being pumped into a general district the ends will meet somewhere; there is no division intended.

377. Could you supply the whole of the area through which you give water, from any set of engines, or any engine?—Not properly. It is necessary for the two sets to be working together to supply the district properly.

378. Why?—Because I have not power enough at the upper one to do it to the full elevation, and I have not power enough to do it at the lower one within the 14 hours a day.

379. Supposing that you are not supplying a gallon from your mains, but that you have to pump the water in until it ramifies and fills them as far as it will do so, would any single engine of yours fill the whole of your mains?—I have no doubt that several of them would fill the mains, supposing them to be all shut.

380. Have you any means of supplying your mains by any of your engines separate and distinct from any other engines?—We have no such means or method ordinarily in use. We are well provided with sluices for dividing the mains if necessary, but with the exception of our having two portions at a higher elevation than the others, the mains join each other promiscuously.

381. What engine, or what water supplies those two small elevated districts?—One is at the north end of the parish of Hackney comprising Upper Clapton and Stamford Hill, and I have another in Essex lying beyond Epping Forest. The Stamford Hill district I am able to supply either from Lee Bridge or from Old Ford. The Essex district is exclusively supplied from Old Ford.

382. Then both those high districts are supplied from your lowest pure water basin?—The Lee Bridge water-wheel is now working to Stamford Hill, but for some years past I was entirely supplying Stamford Hill from Old Ford.

383. If water went into your services from the open tanks during the beginning of the year, or before cholera broke out, would it go to the higher districts or to the lower districts?—There is no choice; it would be free to go any way.

384. Is there anything in your mode of supply, so far as you know, which would give a separate water to any separate district?—As to those higher districts, nothing whatever, but as to the lower district a very considerable influence is effected in the following way: For some years past the engines at Lee Bridge, the upper station, have done all the night work. Varying with the season and the condition of the engine, we start the engines at Old Ford earlier or later, but seldom start them later than half-past 5 in the morning, and seldom stop them earlier than 7 or half-past 7 in the evening, and from half-past 7 in the evening till half-past 5 in the morning the supply is entirely produced from the Lee Bridge station, and therefore there is a very considerable difference, taking the way in which your question stood.

385. You are aware that cholera, from whatever cause it comes, did not prevail equally throughout the district which you supplied, but was more intense in some parts than in others?—Yes.

386. So far as your knowledge goes of your own mains and works, was there anything in your mode of water supply to account for that?—Nothing whatever.

387. Was it really the same water, so far as you know, where the cholera was worse and where it did not rage so badly?—Certainly.

388. Was the mode of domestic supply at all different?—Not at all.

389. If the water had anything to do with producing cholera, as far as you are acquainted, the water was the same all through your area?—Yes.

390. (*Professor Way.*) Are you sure that all the water is the same?—Yes.

391. And that it is merely passed from one reservoir into the other?—The lower reservoir is a little further off than the upper one.

392. But the water of it has all gone through the upper one?—Yes.

393. (*Mr. Harrison.*) After filtering the water, you do not let the water come from the upper reservoir at all, except that it goes to the engine and to the pipes?—Yes.

394. Is the water which you pump from the lower station entirely excluded from the light?—The reservoirs are covered over.

395. At Old Ford as well as at Lee Bridge?—Yes, but there is a very small amount of reservoir at Lee Bridge. The Lee Bridge engine may be said to draw almost directly from the filter beds.

396. When you pump from Lee Bridge, in which direction does the main go?—To the west and south-west.

397. When you pump from Old Ford, in which direction does the main go?—The majority of it goes west because the position of the district is west.

398. Would not the water pumped from Lee Bridge and the water pumped from Old Ford have to pass through a considerable length of pipe before they they would meet?—Yes, in any bulk.

LONDON.

Mr. C. Greaves.

10 Dec. 1866.

399. Therefore, would not the answer to Mr. Rawlinson's question be that a considerable district must be supplied from the lower reservoir, and another considerable district from the upper one?—It is quite probable that it is so.

400. It is almost certain?—Yes, it is a practical difficulty at certain periods of the day.

401. Was the district where the cholera raged supplied distinctly either from one or other of those two sources?—Yes.

402. From which source was the water supplied to the district where the cholera raged?—Probably from the lower one.

403. (*Chairman.*) Then, if at any time the water was drawn from the open reservoir and the conduit which we have spoken of, it would be supplied to the lower district?—Yes.

404. Then the lower district would feel the effect of it if there was any effect?—Yes.

405. (*Mr. Harrison.*) Do you supply West Ham with water?—Yes.

406. From which source do you supply West Ham?—From the lower source during the day, and the upper source during the night.

407. Did cholera rage much in West Ham?—It was bad there.

408. West Ham is thoroughly sewered, is it not?—Yes.

409. A complete system is carried out?—Yes.

410. And the sewage is taken rapidly away from the whole area?—It flows into Bow creek.

411. Do you know whether in the lower area which you supply there are any private pumps from which water is taken for domestic use?—There are.

412. Are they numerous?—No, I should not call them numerous; they are decreasing.

413. Are they both in West Ham and at the opposite side of the river?—Yes, there are some in the metropolis. West Ham is not a part of the metropolis, and there are several in West Ham.

414. Have you ever had the water from those private supplies analysed?—No.

415. Do you know whether it has been analysed during the cholera?—Yes; it has been analysed from time to time.

416. Lately?—That I do not know.

417. (*Professor Way.*) Have any of those pumps been shut up by authority during the last few months?—I believe several of them.

418. Does Dr. Letheby furnish an analysis of your water every month?—Yes, for our private knowledge and information and justification. (*The witness subsequently furnished an analysis for the years* 1865 *and* 1866, *and it will be found printed at the end of his evidence, Appendix No.* 4.)

419. Does he accompany that analysis with any written report?—A short letter.

420. Stating what the quality of the water is, so far as chemical analysis shows it at that time?—Yes, he gives a distinct analysis of the constituent elements of the contents, but that is not furnished by Dr. Frankland.

421. Does he give with it any comparison of other water supplies in the metropolis?—Not when he sends the report to us.

422. But you have the means of comparison?—We have, but he now reports to an association of medical officers, in which they are all arranged side by side.

423. Within the last few months, that is to say, during the prevalence of cholera in that district, did he make any special report or any special recommendation?—No special recommendation.

424. Was his attention as medical officer and as analyst called in any particular way by your board to the condition of the water?—He analysed some samples for us during the prevalence of cholera, which otherwise would not have been sent to him.

425. With the view of ascertaining whether there was any real ground of complaint of the nature of the water?—Yes

426. What was his report upon that subject?—The water turned out very good upon the analysis. It gave the ordinary result.

427. That was a special report separately from his ordinary monthly report?—Yes.

428. Did he make any remarks in that report?—I think not. I do not recollect any, except that the remark was that the water was a very good water, or some such remark as that, that there was no difference in the analysis.

429. Can you let us have a copy of that report with the other analysis which have been promised to us?—Yes. (*The analysis was subsequently furnished by the witness, and will be found printed at the end of his evidence, Appendix No.* 5.)

430. Do you know whether Dr. Letheby has ever analysed the water before passing through your filters?—Yes, I think that I once sent him a specimen of unfiltered water, but there was a great deal of sedimentary matter after a flood, and I wanted to know what the sediment consisted of, because in conversation with some chemists it had been stated that the quantity of matter in suspension was organic, which was not my opinion. My idea was that it was clay, and I had an analysis specially made to see whether it was so, and it turned out to be so.

431. Do you know at all of your own knowledge whether any change is effected in the chemical composition of the water by filtration. Do you consider that your water is not only cleared from sedimentary matter by filtration, but that it is improved so far as organic matter is concerned?—We conclude that it is.

432. Therefore if the water was bright, and did not require filtration to remove the suspended matter, it would still be improved by filtration?—I think so. I should recommend water being filtrated in either case, unless I knew by special analysis that it contained nothing objectionable.

433. If the powers sought by your Bill for obtaining water from the Thames were given to you, would the additional supply be inferior or superior in quality to your present supply?—I do not think that there would be much difference, the waters are very much alike.

434. With regard to the pollution of the water by the districts lying above your sources, I suppose that it is the intention of your company to put a stop to it?—We are particularly desirous that some system should be commenced under the advice of this Commission, or in any other way in which it could be brought about, by which a diminution should be effected of the free liberty which people have to put anything and everything into the river.

435. The pollution by sewage would be one source of pollution, but I suppose that your attention has been called to other causes of pollution?—We do not know of other pollution on the Lee besides domestic sewage. The manufactories on the Lee are not numerous, or the mills for grinding anything except flour.

436. Are there any paper mills on the Lee?—I think not. Corn and oil may be put down as occupying all the mill power on the Lee to which the Lee water is applicable as a source of power.

437. (*Chairman.*) Do you know whether your filtering area is in greater or less proportion than that of the other metropolitan water companies?—It was in greater proportion, but alterations have been made in the area of the filter beds, which have not been strictly rendered up. I, however, believe that I am now not behind anyone in the area for filtering purposes.

438. Have you at any time recently put in animal charcoal or carbide of iron, or any other matter to oxidize your water?—Nothing at all, but simply fine sand filtration.

439. Have you ever tried such a thing experimentally?—No.

440. Have you ever had it recommended to you?—Yes, by Dr. Frankland.

441. Have you ever seriously thought about it?—I have certainly seriously considered the matter, as to whether it was practicable, or feasible, or manageable.

442. Would not Dr. Frankland be a great authority upon that question?—Yes, as to the chemical view.

443. Have you turned over in your mind the question of future purification, as to what mode could be adopted to purify the waters of the Lee from the sewage of those towns which now pollute it?—The only idea which I have in my own mind runs to the prohibition exclusively of the incoming of deleterious matters, and not to any difference in the mode of cleansing the water after they have got in.

444. The Lee is, I think, a navigable river?—It is in parts. There is a navigation extending from the river Thames to Hertford, and branching out of that to Stortford.

445. As to the mode of purification. If you are to prohibit the sewage from passing in, what is to take place then? Would you have a parallel conduit, and land it into the great outfall of the metropolitan sewers?—That is one way of diverting it. But is it impossible that in certain cases it could be applied upon land?

446. Certainly not. You mean that you would have a prohibition similar to that which was put into the Thames Conservancy Act of last session?—That appears to be the most recommendable plan.

447. Have you looked over the clauses in that Act?—I have carefully read the Act.

448. What do you think of the protective clauses in that Act?—I think that it is quite a step in the right direction. Looking at the interests of water drinkers and water users, I think that they are entitled throughout the kingdom to have protection secured.

449. You see that by that Act the companies have to pay a certain rate or rental to the Conservators for the work done?—Yes.

450. 1,000*l.* a year each?—Yes.

451. Do you think that your company would object to pay a contribution for the necessary work?—I am quite sure that they would not object to pay a contribution—of course I cannot say anything as to amount.

452. It must be equitable and reasonable?—Yes.

453. What body do you think would be competent to carry out the necessary prohibition—would it be yourselves or the River Lee Trustees as a company, or would it be a new body to be set up?—I think that you would have to establish a new body.

454. Do you think that the Trustees would not take that if they were held free from cost?—The Trustees of the Navigation at present are an unpaid body of gentlemen belonging to the neighbourhood of the Lee. They might undertake onerous duties, and duties which would be much more invidious than anything which they have had hitherto to undertake in the exercise of their duties as a trust.

455. Are you aware whether the Conservators of the Thames are an unpaid body or a paid body?—I thought that they were paid.

456. I believe that there is an allowance made to them?—(*Mr. Beardmore.*) The River Lee Trustees have no payment.

457. (*To Mr. Greaves.*) They pay their officers?—No doubt.

458. Then the Conservancy of the river Lee would come under the cognizance of their officers?—Yes. But I think that if the duty in question was confided to a trust, the representatives of all those interested should be able to put in their own appearances. I do not think that you could altogether delegate it to a trust; you might delegate it to a body of paid officers.

459. Are the members of the trust not elected?—I am not aware of that.

460. (*To Mr. Beardmore.*) Are they nominated in and in amongst themselves or are they elected?—Some are elected, but there are a good many *ex officio* Trustees, the members for the counties and the New River Company are representatives *ex officio*.

461. I suppose that the trust is framed something like the old Conservancy of the river Thames?—The New River Company are represented officially by the Governor, and the Deputy-Governor, and the Treasurer.

462. (*To Mr. Greaves.*) So far as you have considered the question, you think that the duty must be performed by a special body?—I think so; the question is a wide one, and will require a good deal of consideration. You are aware that the jurisdiction of the Metropolitan Board of Works ends of course in the metropolis, and the metropolis is bounded by the river Lee. The jurisdiction of the Essex Commissioners of sewers comes up to the borders of the Metropolitan Commissioners, they therefore have an interest in that portion of the valley of the Lee, as far up as their district runs, down to the Thames. Then there are several suburban parishes, where sewage is becoming a great annoyance and a detriment to the district, which are beyond the limits of the district of the Metropolitan Board, and are beyond the limits of the district of the Essex Board, and they would not exactly be at one with us, because their ground reaches down to the point where we take clean water. It therefore seems to me that there are many interests to be represented beyond those of the mere water drinkers, whose interests would be well confided to some general body or commission, to whom all these interests should be confided.

463. But as in this country taxation and representation are considered to go together, do you think that your company, if they are to be rated at all, should not also be represented?—I am strongly of opinion that they should be very distinctly represented.

464. Have not you a larger interest in preventing pollution than any other individual, as your success depends upon your giving water which shall not be open to the charge of producing disease?—Certainly.

465. (*Mr. Harrison.*) What is the character of the subsoil of the district which you supply with water?—Mostly gravel.

466. Are there cesspits or anything of that sort to any extent remaining in the district, or is it thoroughly sewered, and is the sewage carried away by a regular sewage system?—There are still a great number of cesspits.

467. Are any of those in juxtaposition to the wells which you have mentioned?—They were. I cannot from my own knowledge say that they are at present, but it is almost impossible that it should be otherwise.

468. If there are these cesspits, and if the subsoil is gravel, and if you have these private wells, there is a probability of an intercommunication?—Certainly.

469. I presume that you are well acquainted with the general area of the river Lee?—Pretty well with the whole district.

470. Besides your company, the New River Company take their water from the river Lee, do they not?—Yes; principally from the river Lee, and if not from the river Lee, from springs issuing in the district close adjoining it.

471. Then there are three bodies which are interested in the water of the Lee, the New River Company, the Trustees of the River Lee for the Navigation, and you, the East London Waterworks Company?—Yes; there are those three bodies who are interested in the water.

472. How far do you say that the navigation goes?—The main line goes up to Hertford, and there is a branch from that to Stortford.

473. From what point do the New River Company take their water?—At a place called Balance-Engine, between Ware and Hertford.

474. Is the town of Hertford above the point from which they take their water from the Lee?—Yes.

475. Have they any intercepting system similar to yours, so as to carry the sewage of Hertford below the point from which they take the water?—Yes, they have an intercepting system, and drains are laid

LONDON.

Mr. C. Greaves.

10 Dec. 1866.

into it from Hertford, by which the water coming down, after having been treated by a special process, is carried forward into the river.

476. What towns are there above Hertford situated upon the base of the area from which the New River Company draw their water?—The principal town is Luton.

477. Is that a very large town?—It is the largest town in the whole watershed of the Lee.

478. Do you know the number of inhabitants of Luton?—17,000 by the last census.

479. Are you pretty well acquainted with the geology of the basin of the Lee?—Yes.

480. What is the geological character of the district from which the New River Company obtain their supply?—I should say that certainly chalk predominates as the subsoil, and may be considered to be the main geological stratum of the district, it is overlaid with patches of one thing and another, but in no great quantity.

481. Can you give us the total area of the water basin of the Lee?—The total area of the water basin of the Lee may be called 500 square miles.

482. Can you give us the area of that part of it above the point from which the New River Company take their water?—On my papers it stands as 244 miles.

483. That is about one half?—That is about one half of the whole watershed.

484. There is the Lee Proper, from Luton down to Hertford, does it chiefly flow over the chalk formation?—It chiefly issues from the chalk formation.

485. Does it chiefly flow over the chalk formations?—I do not think that chalk appears very extensively as a surface in the valley, but I believe that it is not far below.

486. The Mimram is a tributary coming in above Hertford, is that principally through the chalk?—There is chalk to be found at no great depth, and there are chalk cuttings.

487. Would you call it a chalk district?—Decidedly.

488. Then there is the Beane, is it a chalk district?—Yes.

489. Do they obtain their water from the Rib?—Yes, those three rivers and the Rib or Quin unite.

490. Is it chalk?—Yes.

491. Then there is the river Lee running northward by Hatfield?

(*Mr. Beardmore.*) That is the Lee Proper.

492. Is that upon the chalk?—Yes, but a large tributary shown on the clay does not exist; the ordnance map should be corrected.

493. What is the volume of water which the New River Company have power to supply?—The New River Company have power to draw from the river at that point, 2,500 cubic feet per minute.

494. How many gallons a day would that be?—22,500,000.

495. What volume of water is required for the navigation, is any certain quantity reserved for that?—Those quantities are strictly defined; there are three quantities, an upper quantity, a middle quantity, and a lower quantity, and they can be stated.

496. Those two volumes of water are the first claim upon the river at the upper part?—The New River draft is the first draft, but that is subject to the quantity required for the navigation. Then the quantity of water used for the navigation is not altogether abstracted from the river, because the navigation goes in and out again, here and there using the natural course of the river, and then passing from it in short cuts which re-unite with the river.

497. Have you any information as to the volume of water which passes Hertford from all those sources in a very dry season, such as 1864 and 1865?—I have no precise information.

498. You have not gauged the river?—No measurement of the river has been made there.

499. Besides those rivers which supply the Lee at Hertford, is there the Ash?—That is the next stream.

500. Is that in chalk formation?—Yes.

501. Throughout its whole course?—I think so. I have never been all round the borders of it, but wherever there are any deep cuttings made or any excavations about the Ash they show chalk.

502. Is it the same with the Stort?—The Stort is chalk in the upper portions of it, but there is a large extent of clay in the Stort Valley.

503. Those are the two principal tributaries from which you derive your supply, independently of what may be left after the New River Company and the navigation have abstracted the quantities which they have the power to abstract?—Yes.

504. What volume of water does the Stort afford in a very dry season like 1864 and 1865?—I do not know that any precise measurement has been taken or can be taken of the water issuing from these rivers as distinct from one another, it would be a difficult and intricate process, and in order to be worth anything it must be maintained through a long series of observations.

505. Is it or not the case that the Stort in a very dry season is reduced to a very low ebb?—I have no doubt that it is.

506. From the character of the soil do you not think that it would be so?—Yes, and no doubt it is so.

507. The rivers above would be more of a perennial character, and the Stort would be much more of an intermittent character?—Yes.

508. So that in a dry season the Stort is not to be relied upon for a water supply?—No, you cannot rely upon it for a delivery of water as you can on the others. The Ash also runs very small in dry weather though it is very much in chalk.

509. Then in dry weather that would reduce your source of supply chiefly to the leavings of the navigation and of the New River Company above?—No, I can hardly say that, I think that it is quite possible that there may be as much other water; that is a point which I have hardly come upon.

510. If the Ash and the Stort are your chief sources of supply besides that above, and if those streams, as you state, are reduced to a very low ebb in a dry summer, it seems to me you are left with the leavings of the New River Company and of the navigation above?—Yes.

511. Although those streams are of large area they really do not afford you much water in a dry summer?—No; but there are very considerable springs below the point at which the New River Company takes its water out of the river.

512. In the years 1864 and 1865 what was the fact as to the volume of water which came down to afford you a supply?—It was barely enough in 1864.

513. What volume of water was then coming down the river at the point from which you take your supply?—20,000,000 gallons a day, I suppose, or more.

514. Between the point from which you take your supply and Hertford, is there not a very considerable population?—There is.

515. Even above the point from which you divert the sewage past your works?—Yes.

516. Is that a population lying comparatively near the river?—Some of it lies very near the river, and some of it lies at a distance. I do not know whether that would characterize the whole population, but a good deal is near the river.

517. Is that population to a very great extent situated upon the London clay?—No, I suppose that you would hardly locate the population of Waltham upon the London clay, although a part of it is upon the clay. The population of Waltham Abbey and Ware are entirely in the flat part of the valley with clay and gravel and some chalk, and the population of Stortford is on clay resting upon chalk.

518. Any liquid falling upon the surface is not likely to get through the London clay on to the chalk?—Not through the amount of clay which there is there.

519. Is there any system of sewerage carried out throughout that district?—No general system; each town is left to its own affairs.

520. Have they carried out any system of sewerage?—There are drains more or less.

521. Where do they discharge?—Into various parts of the river; none discharge into anything else but the river.

522. Can you give us the population between the point where you take the water and Hertford, including Hertford and Ware?—I think that I have notes of the population of different places. The population of the parish of Waltham Abbey, which is a very extensive parish, and the majority of it on the eastern side of the Lee with some on the west stands in the last census as 5,044. The population of Ware which is next above is 5,397. The population of Hertford is 7,086.

523. Are there not some towns or considerable places intermediate between Waltham Abbey and Ware?—There is Cheshunt which is a populous place, it stands in the census as 6,592. The population of Hoddesdon stands as only 1,898.

524. Is there any considerable population on the Stort?—There is Sawbridgeworth on the Stort with a population of 2,701, that is taking the whole parish. I have not the towns or the populous places. Stortford is the most important place on the Stort with a population of 5,390.

525. Besides those places there is a consideral rural population?—Yes, and a considerable population of small hamlets and villages, but those are the principal accumulations of people. I have taken out figures from the population tables, but I have had no means of separating between the more townlike sets of inhabitants and the pure rural districts.

526. The sewage of all these places you say comes into the Lee and its tributaries above the point at which you take your water supply?—Yes.

527. And the water of the Lee is diminished by that abstraction; the Stort and the Ash are reduced in the summer to a very low ebb as to supply?—Yes.

528. Does it not follow that with that small quantity of water coming down to you, and with a large population resident upon the banks, in such a summer as those of 1864 and 1865, the water at the point at which you take your supply must be very much polluted?—It does not follow so clearly as to put it in that simple form, because during the time when the river is low the discharge by all these towns and villages is low; I do not know that the pollution is very much worse then than it is at other times; there is no doubt that the pollution militates against the prospect of having pure water.

529. For how many days supply did you say you had the means of storing water?—For seven or eight days, and still having something left.

540. So that in a dry summer such as those of 1864 and 1865 you are practically dependent entirely upon the river itself as it comes down to you?—Yes.

531. And you cannot take advantage of any considerable flood, so as to store a large quantity of water after the river has been cleared out and the water comes down comparatively pure?—No reservoirs have been yet made with a view to store over such a length of time as you would imply; there are none to store winter water for summer time; it is possible that they might be made to a limited extent so as to supplement the flow very considerably.

532. Have you gone into the question of the Acts of Parliament which have been passed at different times bearing upon this inquiry?—I believe that I am acquainted with all the Acts of Parliament.

The witness delivered in the following paper:

Paper delivered in by Mr. Charles Greaves, the engineer of the East London Waterworks Company.

1. The river Lee rises in Bedfordshire, flows by Luton and Hertford, then takes its course by Ware, Hoddesdon, Broxbourne, Enfield, Tottenham, and Hackney, to its confluence with the Thames.

2. Its principal tributaries are,
The Upper Lee at Hatfield;
The Mimram above Hertford;
The Beane and the Rib immediately below Hertford;
The Ash below Ware;
The Stort at Hoddesdon (including the Pincey Brook);
The Cobbin Brook at Waltham Abbey;
The Chingford Brook at Edmonton.

3. Of these several streams none but the Lee and Stort is subject to any special statutory regulation.

The following are the Acts relating to the Lee:

1.—13 Elizabeth cap. 18. An Act passed at the instance of the Corporation of London authorizing them, with the aid of Commissioners named in it, to take lands for making and to make a navigable cut from the Lee at Ware to or nearly to the Thames.

2.—Jac. 1. By which Act the New River obtained their original power to take water from the Lee.

3.—12 Geo. 2. cap. 32. An Act to extend the Lee navigation, as effected by the Corporation of London, under the Act of Elizabeth from Ware to Hertford, to ascertain and settle the quantity of water which the New River Company might take from the river and the mode of taking it, to appoint Trustees to carry the Act into execution and watch the New River Company's works and draught, and to make the New River Company liable to pay certain annual sums (300*l.* and 50*l.*) to the Trustees for the support of the navigation between Hertford and the Corporation cut.

4.—7 Geo. 3. cap. 51. (1763.) An Act for authorizing various improvements of the navigation by new cuts and otherwise for extending it to the floodgates at Hertford, and for vesting the entire jurisdiction theretofore exerciseable by the Corporation of London and by the Trustees appointed under the Act of Geo. 2., with various new powers for improving and managing the river for the purposes of navigation in a new body of Trustees, being in substance the same body of Trustees as now constitute "the River Lee Trustees." This Act also gave the Trustees the first power of taking tolls for the use of the navigation and to borrow monies on the security thereof.

5.—19 Geo. 3. cap. 58. (1779.) This Act for increasing the tolls on the navigation, for conferring some further powers on the Trustees, and ratifying certain arrangements between them and some of the millowners.

6.—45 Geo. 3. cap. 69. (1805.) This Act was principally for confirming arrangements between the Trustees and some of the millowners.

7.—47 Geo. 3. cap. 72. (1807.) This Act incorporated the East London Waterworks Company for supplying a large area in the east of London with water, and authorizing them to take the waters of the Lee for the purpose "at or near Old Ford," but only "during such time as "the tide water should be flowing up the river, and had "flowed to such a height as to stop the working of the "mills below on the river."

8.—48 Geo. 3. cap. 8. (1808.) This Act sanctioned the absorption by the East London Company of the previously existing Shadwell and West Ham Waterworks, which had certain statutory rights of taking water from the Lee below Old Ford: but the whole matter is entirely obsolete.

9.—10 Geo. 4. cap. 117. (1829.) This Act first authorized the East London Company to take water above the influence of the tide, viz., between Lee Bridge Mills and Old Ford Lock, and for this purpose to make an aqueduct of limited size from the tail stream of Lee Bridge Mills to Old Ford. This Act in protection of the navigation restricts the company from taking their water higher or elsewhere, but seems to have left them at liberty still to take the tidal water, at all events it contains no clear repeal of the power to do so. The navigation and mill and riparian interests were propitiated in respect of this higher taking of the water by an annual payment of 250*l.*, secured by the Act to the Trustees, by the company becoming bound to construct and maintain "compensation" reservoir at Hackney, and by divers special enactments for the protection of the navigation and other interests.

10.—13 & 14 Vict. chap. 109. (1850.) This important Act (ordinarily called the River Lee Improvement Act 1850) effected many objects. It improved somewhat the construction of the trust and incorporated the trustees. It authorized several new cuts and other navigation works. The Trustees took on themselves some works with reference to the East London Company's supply, and that company came under obligation to make considerably increased annual payments to the Trustees, and the

LONDON.

Mr. C. Greaves.

10 Dec. 1866.

quantities of water they were to take and the manner of taking it were regulated. Several special arrangements were sanctioned between the Trustees and the East London Water Company, and other (mill and riparian) interests, and the Trustees acquired the power of selling for the purpose of supply to certain specified districts the surplus waters of the Lee, so nevertheless that proper reserve for navigation purposes should be made. As regards millrights, the river was to be gauged and the amount of the river's water power throughout ascertained by engineers, and compensation given to each mill, &c., for any loss by reason of any act of the Trustees.*

(This Act is full of important details.)

11.—15 Vict. cap. 164. (1852.) By this Act all the previous Acts of the East London Waterworks Company were repealed, but several scheduled provisions contained in them (as to the compensation reservoirs and the like), and all the provisions relating to the company to Trustees; the Acts and the New River Company's Acts were saved and the company was re-constituted, its capital and powers and district defined afresh, but without alteration (except as next mentioned) of their point of supply from the Lee; and as regards general regulation it was brought under the Waterworks Clauses Act, 1847. The company acquired powers to make reservoirs and filtering beds at Lee Bridge, and new cuts upwards from thence to Tottenham mill tail and mill head so as to separate their water from the general stream and the navigation at a higher point. They also acquired powers to make and maintain an intercepting drain so as to intercept sewage and foul waters then reaching the Lee at divers points on its right bank above the company's supply head, and to take them lower down and pass them into the river (navigation) below the company's supply head.

12.—16 & 17 Vict. cap. 166. By this Act (which is now the governing Act of the East London Waterworks Company) the company's Act of 1852 was repealed, but all its provisions material to the present consideration were re-enacted, the company's district was somewhat extended, further reservoirs were authorized, and some few further provisions as regards outside interest inserted; but a main object of the company in coming before Parliament in 1853, that of raising their supply head to a much higher point on the river, failed.†

The unsuccessful parts of the company's application to Parliament in 1853, although at first sight not directly material to the present inquiry, ought not to be passed by, for the same difficulty in 1866 exists, and renders the nonpollution of the stream more important.

The company in 1852 were required by Parliament to seek in 1853 powers to take water from a higher point on the Lee, and accordingly they prepared plans, &c., and sought by their Bill of 1853 powers to make new cuts from the neighbourbood of Lee Bridge to a point on the river immediately below the confluence of the Lee and Stort. This proposal was opposed by the Government as owners of the powder mills and armoury works at Enfield, and was necessarily abandoned, and the legislation of 1853 ended therefore without affecting materially that of 1852.

In the same year and as part of the same plan, the company proposed a scheme for intercepting the drainage of Hertford, but this fell (as not worth pursuing) when the higher supply head was denied them, and it was besides understood that the New River Company would undertake it as immediately affecting their main supply.

13.—17 Vict. cap. ., 20 Vict. cap. . (1854 & 1857.) By these Acts the New River Company undertook the making of a system of drains for Hertford, and obtained provisions for preventing sewerage being discharged into the Lee.

14.—18 & 19 Vict. cap. 196. (1855.) By this Act there was vrey important legislation respecting the Lee, it was obtained at the joint instance of the River Lee Trustees, the New River Company, and the East London Company, and its main objects were to settle differences octween the Trustees and the New River Company, and to define more conveniently the relations of the Trustees with each of the companies and the rights of the companies *inter se*. The general effect of the Act is, after making due reservation to the Trustees of water in the upper parts of the river for the purposes of the navigation, and of all its water below Old Ford Lock, to transfer all the water of the river to the two water companies on the New River Company paying a sum in gross and the two company's jointly paying a perpetual annuity of 3,500*l*. to the Trustees. The Act limits the draught of the New River Company from the river at Hertford, and that of the East London Company at their lower point, and subject to the above-mentioned reservations and their own draughts and their respective limitations, the two companies are by this Act placed at liberty to take the entire river *pari passu*.

15.—29 & 30 Vict. c. 89. (1866.) This "The Thames Navigation Act, 1866," contains provisions extending (not by name) to parts of the Lee, viz., those provisions relating to "pollution of water," (63 and following sections,) and which reach those parts of the Lee situate within three miles of the Thames measured as in that Act mentioned.

The following are the Acts affecting the Stort.

32 Geo. 2. (1729), 6 Geo. 3. cap. 78. (1766.) By these Acts (the latter seems to repeal the former), certain "undertakers" were authorized to execute works and maintain jurisdiction over the river Stort between the town of Bishop's Stortford and the confluence with the river Lee.

As matter analogous to direct statutory jurisdiction affecting the Lee, there is also the jurisdiction of the Commissioners of Sewers for the levels of Havering in Essex and Middlesex.

533. You have handed in a list of the Acts of Parliament; may we take that as being correct, and as giving all the necessary information?—Yes, as giving all the facts belonging to the statutory position of the company.

534. Is there any special points in any of those Acts to which you wish to call our attention?—I am not aware there is anything in which I could assist you by describing it. The East London Act of 1853, is the principal Act upon which we rely for all our domestic arrangements and management, and the the Act of 1855 is the Act on which we rely for the arrangements as to taking water from the river, between ourselves and the New River Company and the River Lee Trustees.

535. I think you mentioned that the river Lee floods the adjoining lands to a considerable extent?—Yes, very largely.

536. How far does that extend up the river?—Throughout more or less.

537. Is the valley much flooded above Hertford?—Certainly not to the extent it is below.

538. By the tributaries above Hertford?—There are floods considerably above Hertford, but not very bad; the heaviest flooding begins below the junction of the sixth tributary, that is to say, below the junction of the Stort.

539. After the river has got upon the London clay?—Yes.

540. Do the two rivers, the Ash and the Short, pass down in flood time a very considerable volume of water?—The Stort sends down a large quantity of water very quickly in floods. I do not know much about the Ash in flood time; it is a river which one does not often visit.

541. Is that more strikingly the case with those rivers, than with the Lee Proper above Hertford, and the Mimram, the Beane, and the Rib?—So far as my knowledge goes, I think so; I cannot speak with precision as to that point; I do not think that the tributaries flood very much.

542. Have any steps been taken to prevent the flooding of the lower part of the Lee, by embanking or other means?—None at all, there is no system of embanking in the Lee anywhere.

543. To whom does the bed of the river proper belong?—To various owners; there is no jurisdiction; there is no statutory power governing the channel, or the bed of the river as an old river apart from where it may be used for navigation. The riparian proprietors have never joined together, nor is anybody charged with any duties with respect to it; in fact the majority of the flat lands on the Lee are common lands or lammas land, that is to say, common for six months in the year; each parish has a large extent of meadow lands of that kind, but in some of the

* These gaugings were made and recorded and are now in operation.

† In this year (1852) also there was passed the Metropolis Water Act, 1852, which *inter alia* interdicted the companies from the supplying of water not previously filtered and gave the Board of Trade jurisdiction to inquire (on the memorial of consumers) as to the quantity and quality of water supplied.

parishes the Enclosure Act has been taken advantage of, and these flat lands have been appropriated to individuals.

544. Is the flooding advantageous or otherwise to those meadows in an agricultural point of view?—That is a question which I cannot answer, and I do not know how it could be answered; there are no data to institute a comparison.

545. Do you know whether the flooding affects the health of the people adjoining?—I have no doubt that there is a greater amount of ague and ailment arising than there otherwise would be from cold and damp air, in consequence of the extent of flooding in the low land.

546. Do you know as a fact that there is ague?—It is not a fact that ague is rampant, but rheumatic fever is a very common ailment with working people all through the valley of the Lee, which I think shows that the damp air does affect their health.

547. It was mentioned in the evidence before the commission a fortnight ago, that some improvements made many years ago below Skipton upon the river Aire had had the effect of removing ague, and that some further improvments which had been made within the last few years had had the second beneficial effect of removing fever, which had been very rife before?—I am glad to hear it.

548. (*Chairman.*) A storage of 20,000,000 gallons a day for seven days would give a reservoir area of 140,000,000 gallons; do you think that you have anything like that amount of reservoir space at your command now?—I think that the amount is 170,000,000 gallons, and I am not quite sure whether it is not a little more.

549. In the spring of this year, when the old reservoirs happened to be connected with your pumping machinery, were you at home or not?—I think not; I will not say precisely.

550. You admit that there was a period when the supply was pumped in from the open reservoir?—A quantity of water was let in.

551. In the spring of this year?—Yes.

552. But you do not know the date?—No.

553. And you do not know whether you were at home or not?—I do not think that I was; I will not say.

554. Do you think that it is worth while clearing up that point?—I do not know that any new fact would come out of it.

555. There would be this fact, as to whether or not a large volume was pumped in, and as to the time when it was pumped in, and under what conditions it was pumped in, and why it was pumped in?—It would not alter that condition of things.

556. What necessity existed for pumping that water into the mains?—Only as I described before, that the water on the covered side may have been rather lower than they liked it to appear, and that therefore they replenished it from the other.

557. Had it been customary in former years to subsidise from that source?—We had a little in the year 1864.

558. And no evil results that you are aware of arose from it in 1864?—No.

559. There was no cholera?—There was no cholera.

560. Will you think over the question of any practical form of Conservancy by which the purification of the waters of the Lee and its tributaries may be brought about?—I will do so; that is, assuming that a prohibitory power is a possible enactment.

561. Take the River Thames Act, which you have before you, as a basis, or as a thing accomplished; Parliament has there enacted certain regulations which are to be put in force by a certain machinery?—Yes.

562. If you would quietly look over that Act, and seeing that your company is so vitally interested in the question, if you would give it a consideration, we should be very much obliged to you; it might facilitate our making a proper recommendation upon the subject?—I shall be very happy to give it any consideration which I can, but after the better experience which you as Commissioners have on this matter in a general way, we are rather inclined to look to you for correct advice on the matter. It is not an easy thing to determine how a new Conservancy Board can be established without any previously existing basis, and the case of the Lee does not compare precisely with the position of the Thames, as given over to the Conservancy Board, because in that case they have multifarious duties besides keeping clear the upper valley of the Thames.

563. The River Lee Commissioners are commissioners for purposes of navigation?—The trustees of the navigation itself have certain funds for the purposes of the navigation.

564. And so long as it serves the purpose of navigation they have fulfilled their trust?—Yes.

565. And you think that they would hardly be the body to be entrusted with conservancy powers?—I think that the conservancy body should consist of a certain number of members elected from all the different interests.

566. I suppose that primarily you would say that any conservancy, however constituted, should be a conservancy capable of being worked at the least cost necessary for efficiency?—Most decidedly.

567. As your board would be one of the boards served, and very probably one of the bodies rated, you think that the conservancy should not be a very extravagant conservancy?—It should not; there should be no more money spent by it, or upon it, than was necessary to sustain a common course or line of action.

568. Having the wide experience which you have, and being resident upon the ground, do you think that a Conservancy Board may be established which shall be worth its salt?—I think so.

569. Which shall not cost more than the work which it is capable of doing will be worth?—I think so; but unless a board of that kind were in some sense elective, if it only consisted of a number of persons specially charged with a certain duty, they would be a river police, and they would have all the unpleasant side of the matter to face, not for their own interests, but simply in discharge of a duty for which you may suppose that they would have salaries.

570. If a new Conservancy Board is to be established, and if it is to be elected, I presume that all the towns and all the riparian owners would have votes for representatives, and that your company and the New River Company would either nominate or have elective powers, and that some Government office, such as the Board of Trade or some other public office, might have an elective power and a supervision in case of appeal, similar to the case of the Thames Conservancy?—I think that that seems to be the shape which it appears most reasonable that it should take.

571. (*Professor Way.*) You say that when the river is in flood you endeavour to shut it out from your reservoirs as much as you can?—Yes.

572. Are you always able to do so?—We have excluded every flood which we cared to exclude since we have had the reservoirs, from which we can draw during the prevalence of the flood.

573. Is it not the case that the months of May and June and the whole of the early spring in this year were droughty?—Not this year; the river has been abundant this year.

574. Was not it a dry spring?—We did not find it so in the rivers; these rivers are very abundant in their springs, the sources of them being deep, and being in chalk, they are frequently in very good flow when the weather may be apparently dry. The floods which I speak of are floods of quantity in the river, and not floods of rainfall.

575. Those two things are not necessarily coexistent?—They do not correspond; 1864 is the only year which we can speak of as a droughty year; the year 1865 was very irregular, there were months without much rain, and there were months with a good deal of rain.

576. (*Mr. Harrison.*) Did you find September 1865 the period when the river was lowest?—I do not know; I do not think that I have any paper by me which could recall that to my mind. I believe that in September 1865 the flow was low.

577. Have you kept any rain gauges in this district?—I have rain gauges on my own establishment.

578. Can you give us a return for the last two or three years?—Yes; my rain gauges are kept at Lee Bridge. I can give you returns from there. (*The witness subsequently furnished the return, and it will be found printed at the end of his evidence, as Appendix No.* 6.)

579. Have you any evaporation gauges to show the quantity of evaporation?—I have made some experiments on evaporation, but they are hardly in a condition to report. I should be rather diffident in putting them forward.

580. How many years have you tried it?—More or less imperfectly for seven or eight or ten years. I shall probably make some returns of those experiments some day, when I can get them carried on long enough unbroken to make them fit to be exhibited.

581. Do you know the experiments which Mr. Dickenson has made upon percolation?—Yes.

582. The soil being all chalk, the difference between the rainfall and the percolation would be evaporation?—Yes.

583. Do you find that your experiments at all accord with his observations for a number of years?—I think that my percolation shows rather less than Mr. Dickenson's observations have given.

584. Is your gauge of a similar character?—Yes; the water passing through it is measured, and is registered as percolation.

585. For how many years have you had that gauge?—I think since 1853 or 1854.

586. How frequently has it been observed, once a month?—More frequently than that, it has been according to the quantity; the receptacle for the water cannot be adjusted to contain more than a certain quantity, so that if it gets too full it is emptied and is registered off.

587. Is that up to the present time?—Yes.

588. If you could let us have the result of it, so as to make a comparison, it would be very valuable?—I will furnish you with some abstract.

589. Have you any observations upon evaporation, as well as upon percolation?—I have also endeavoured to make some observations upon evaporation from the surface of the water, as compared with evaporation from the surface of the ground, but they have not been carried on so long. (*See Appendix No.* 6 *at end of this witness's evidence.*)

590. What result have you come to as to evaporation from the surface of the water in this neighbourhood?—In 1864 we had an evaporation of seven inches straight away upon the surface of the water, which very much surprised me.

591. Within what period was that?—Three months; and it reached 9·371 inches in five months.

592. It varies at different times?—Yes, it is continually varying.

593. What have you found to be the average evaporation per annum from water?—I have not the figures at hand sufficiently precise to quote.

594. (*Chairman.*) Are your experiments so far as you have gone confirmatory of the prevalent notion of evaporation from water, or are they subversive of it?—So far as I have been able to read up the subject of evaporation, as treated of in books, I have found the evaporation to be greater in amount than I have been instructed from books that it is.

595. You have tried to get at the accurate amount of evaporation by a method of your own, which you think puts it in a much fairer way than the ordinary evaporating pans?—Yes; I think that the ordinary evaporating pans are rather delusive, and difficult to manage. I think that you may take it as a frequent result that four-fifths of all the rain which falls is re-evaporated, and that rather more is evaporated from the surface of the water than is evaporated from the surface of the ground.

596. (*Mr. Harrison.*) What would you say is the average rainfall in this neighbourhood?—25 inches.

597. Then four-fifths would be about 20 inches?—Yes.

598. (*Chairman.*) But the evaporation from an evaporating pan gives you more than the entire rainfall?—Evaporating pans acquire accumulated heat, and they evaporate more than they ought to do.

599. If you expose water to the continuing action of the atmosphere, the effect is something above the fall of rain?—That is not the result of my gauge.

600. The Birmingham Philosophical Transactions give it as such for Birmingham, if I recollect rightly?—I have no faith in evaporating dishes in ordinary cases.

601. I should say not; but if you could know what a reservoir of 10 or 12 feet evaporated, it would give a reliable test?—Yes, if you could cut out a portion of the surface.

602. (*Mr. Harrison.*) That would be merely evaporation from the water, and not from the surface of the ground?—Yes.

603. You do not mean to say that four-fifths is the evaporation from the surface of the water?—It would be rather more than that, it would be four-fifths from the surface of the land; you cannot depend upon more than one-fifth to percolate and to form springs.

604. That is only reliable under certain circumstances?—Certainly, and occasionally.

605. You cannot apply that rule to the west of England, the rainfall being considerably larger and the evaporation smaller?—Certainly not, and perhaps the rainfall occurs at a different period of the year.

606. There are cases of that kind which make it necessary to examine each locality; you could not apply the experiments made in London to any other district in England?—No, it would be scarcely fair to do so.

607. (*Chairman.*) Do you remember about the period of the floods this year, had you any floods early in the year, in January and February?—I cannot call that to mind, I have not directed my attention to that point for this evidence.

608. But this has been a wet year throughout?—Yes, there is no question about that.

609. At no period have you been short of water?—Not at all.

610. (*Mr. Harrison.*) You gave us the area of the basin of the Lee above Hertford and Ware, can you tell us at all the population upon that area independent of Hertford?—I have not taken it out exactly in that form.

611. In what form have you taken it out?—The population of the whole watershed of the Lee, taking it down to and inclusive of the districts which many years ago we diverted, I put down as 174,000, that is down to the border of Hackney, not including Hackney or Walthamstow.

612. Can you give us the population below Hertford, including Hertford, in the same way?—I can give you the population in 1861 of the district diverted in 1852. I have it as 51,900, you may call it 52,000.

613. (*Professor Way.*) I do not think that I made myself understood just now. When you are short of water in the river Lee you are necessarily short of water for your supply, are you not?—Yes, if we had it not in any way the supply would run short.

614. If you had not a considerable store?—Yes.

615. When the river Lee is in flood you object to take it into your reservoirs, because of the matter in suspension, which chokes your filters too much?—Yes.

616. In either case is it not possible that you might run short of water, that is to say, if the flood was continuous for five or six days, and if you had only five or six days' supply in your reservoir, you would be short of water?—But then I should let in the flood; I should not run short when there was an abundance outside.

617. There are times when you would run in flood water?—Yes, rather than go short of water.

618. Has that occurred at any time this year; at any time during this year have you let any water out of the river Lee in time of flood?—You may shut out a flood one day and let it in the next.

619. You do let in the flood water?—Yes.

620. Can you practically always shut out flood water from your reservoirs?—Yes.

621. But if the flood went on for five or six days you would be obliged to take it?—Yes; I have not reservoir enough to shut out such a flood; in fact this way of working the reservoir is more an incidental advantage which has arisen from the character of the work than from any previous design.

622. Is it not the fact that when you let in flood water you have a large quantity of sediment which is injurious to you; have you not the washings of all sorts of different places which the flood would bring down?—I do not think so. I do not think that there is a greater proportion of anything which is bad in the water when the river is in flood than at other times. Speaking for myself, I should prefer a flood to a drought at any time. I think that the water is more prejudicial during periods of drought than during times of flood.

623. (*Mr. Harrison.*) I think that that is rather contrary to what you said just now, when I asked you as to the condition of the water of the Stort, and the Ash, in the summer time?—I said that it was not worse during a drought than in the ordinary condition.

624. Your argument was that there being very little water about, very little dirt was washed into it?—It is not easy to draw precise comparisons upon all these points.

625. I presume that when a flood comes down it brings a great amount of refuse?—According to its degree, according to its duration. Sometimes a flood brings down mud into the river, it is exceedingly desirable to shut it out, that is almost entirely mineral matter.

626. How many days is it before it comes?—I could not put down any precise duration for a flood, it all depends upon the continuance of the rain, and where it comes from.

627. (*Mr. Harrison.*) But generally after a flood commences will the water run thick for a while?—We generally find that upon the third day from the commencement of a flood the great body of deposit in the water is cleared away, the river in fact has cleared itself of a great body of deposit.

628. So that if you had a full supply in your reservoirs before a flood commenced, you might continue to give off water from that supply, and at the end of seven or eight days receive a volume of water from the flooded river which would be comparatively pure?—Yes, that is the precise explanation of the matter which I have described.

629. (*Chairman.*) Although it had more visible mud in it, the water itself would be of a better character?—I do not fully apprehend that question. The water would be improved by its course through the reservoirs.

630. The water would be more diluted, and although there was visible mud in it, it would come into your pure water basin a better water than the dry-weather flow?—I think that it would hardly go to that extent; that is putting it too much the other way again.

631. (*Professor Way.*) I suppose that the different materials from the towns above your water supply would be washed out by the flood?—Yes, and they would come down with the first of the flood, and the first of the flood is very turbid in consequence.

632. Supposing that you had a flood supervening upon a very dry period, you must take in water earlier than you would wish to do?—Yes.

633. That you say has not occurred this year?—No, I cannot discriminate that it has done so; we have had no trouble this year. If the excessively turbid water has passed by we fill up so much the sooner.

634. The turbid water I presume is a guide by what you can see to what you do not see?—It is.

635. (*Chairman.*) Do you know whether any foreign substance, such as charcoal or carbide, or any material of that description, is used in any place upon a great scale for filtering water?—I believe that it is not, from inquiries which I have made, and information which I have gathered.

636. Do you know anything of the supply of water at Wakefield?—Nothing more than that I believe that it is one of the places where Mr. Spencer's process has been tried.

637. And where it is being carried on?—I believe so.

638. Have you made any experiments upon a small scale, for your own satisfaction, either with wood charcoal, bone charcoal, or carbide?—Not recently. I did a little in the way of filtering dirty water through vegetable charcoal some years since.

639. Do you know what is the chemical or mechanical action of charcoal in water filtration?—It seems to have an attractive power on organic matter, and to draw the matter to the grains of charcoal; but it does not seem to me at all proved whether the action is purely mechanical, or whether there is anything which may be called chemical in it.

640. Do you know that, whether rightly or wrongly, or whether beneficially or otherwise, in all the filters which are sold in the shops the filtering medium is either wood or bone charcoal?—I believe that it is charcoal and sand.

641. And that filters are made with Mr. Spencer's carbide?—I do not know as to that.

642. If any beneficial results are obtained from household filters by Mr. Spencer's system, do you think that those results could be obtained upon a great scale at a less cost than the present results?—I cannot see any facility for carrying out the process of filtering large quantities of water through charcoal, unless one was going to construct works. I do not at present see my way to do it so as to obtain the benefit described.

643. What is the base of the filter bed, is it concrete?—Yes.

644. And then you have a series of drains upon that concrete?—Yes.

645. What do you fix in between the drains?—Large stones, and the coarsest gravel which I can get.

646. As big as my fist?—Yes.

647. And then you diminish the size until you get to the size of peas before you come to your sand?—Yes.

648. Of what depth is your sand?—It varies. I may take 18 inches as the normal depth.

649. Supposing that you put upon your peas a layer of any kind of charcoal of five or six inches thick, either wood or bone charcoal, or of carbide, all the water must come in contact with that charcoal until you get down to the drains?—Yes.

650. Do you see any difficulty in that?—No, it is the only way which I can see of using the charcoal.

651. (*Professor Way.*) Dr. Frankland has stated, I think, that 300 tons of charcoal would be sufficient for the whole water supply of London?—Yes, but Dr. Frankland does not imagine that it is used in your way. He thinks that after the water is filtered it

LONDON.

Mr. C. Greaves.

10 Dec. 1866.

may be sent through some vessel in which a cage for the charcoal can be put, but that I think is altogether impracticable.

652. (*Chairman.*) Professor Way, I daresay, will tell you what the chemical action of charcoal is, and that it is necessary for the water to be in contact with the charcoal for some time; and that pouring a large quantity of water through a minimum amount of charcoal, will do a minimum amount of good, or no good; and that if you are to do it upon a great scale, it must be somewhat in the way which I have sketched out to you?—Yes.

653. (*Professor Way.*) The price of the carbide is 10*l.* a ton, and the price of animal charcoal I think is generally about 12*l.* a ton, so that there is not much to choose between them?—Just so.

654. And if Wakefield can afford to use carbide in the way in which they use it, they can afford to use animal charcoal?—Yes.

655. (*Mr. Harrison.*) Can you state whether the population in the neighbourhood of the river is increasing between the point from which you take the water and Hertford?—It is increasing very greatly in the neighbourhood of the river; Cheshunt is a very increasing town.

656. Considering the position of the point from which you take the water of the river Lee, and the large population on its banks, with every care which may be taken, do you think that the river Lee at that point would be a proper source from which to derive a water supply for London?—If a reasonable authority is used in excluding the sewage the river is as pure there as it is further up, because it suffers no other contamination.

657. You do not think that the refuse matter from that populous district, which must more or less find its way into the river, would cause that river to be an objectionable source of supply?—No. I do not see anything there, other than domestic and house sewage, which would be liable to contaminate the river.

658. (*Chairman.*) Is there anything which you wish to add to the evidence which you have so kindly given us?—I do not call to mind anything now which would help to elucidate this matter, or which would affect anything I have said.

The witness withdrew.

Adjourned to to-morrow at half-past 10 o'clock.

APPENDIX No. 1.

To the Evidence of CHARLES GREAVES, Esq., Engineer-in-Chief (referred to supra, Question 253).

The number of fire plugs in the East London District in the public streets at Christmas 1866, were 9,292.

(Signed) CHARLES GREAVES,
Engineer.

APPENDIX No. 2.

To Evidence of CHARLES GREAVES, Esq., Engineer-in-Chief (referred to supra, Question 309).

APPENDIX No. 5.

To Evidence of CHARLES GREAVES, Esq., Engineer-in-Chief (referred to supra, Question 429).

EAST LONDON WATERWORKS.—SPECIAL ANALYSIS.

Extract from Dr. Letheby's Report on waters sampled August 9, 1866. College Laboratory, September 3, 1866.

"The following are the results of the analysis."

	Old Ford filtered. Grains.	Old Ford uncovered. Grains.
Carbonate of lime and magnesia	10·81	11·06
Sulphate of lime	3·45	2·91
Alkaline chloride	1·42	1·53
Alkaline nitrate	1·27	1·90
Silica and alumina	0·50	0·50
Organic matter	0·48	0·56
Total per imperial gallon	17·93	18·46
Hardness before boiling	12·5	13·5
Do. after boiling	4·	4·

These results show that practically the two samples are the same, the differences being too slight for any notable distinction.

The samples also correspond in quality with the other samples analysed during this month, namely; the samples sent early in this month and the sample taken from the main at the London Hospital.

	Sample from works.	Sample from main.
Carbonate of lime and magnesia	10·96	11·51
Sulphate of lime	2·91	3·05
Alkaline chloride	1·52	1·52
Alkaline nitrate	1·39	1·28
Silica	0·50	0·27
Organic matter	0·40	0·56
Total per gallon	17·68	18·19

These results are nearly the same as were obtained last month, and they are a little above the results of the corresponding month of last year, when the solid matter was about 16 grains per gallon.

(Signed) H. LETHEBY.

(Signed) CHARLES GREAVES, Engineer.

Victoria Steeet, Tuesday, 11th December 1866.

PRESENT:

ROBERT RAWLINSON, Esq., C.B., IN THE CHAIR.

JOHN THORNHILL HARRISON, Esq. | Professor JOHN THOMAS WAY.

LONDON.

N. Beardmore, Esq.

11 Dec. 1866.

NATHANIEL BEARDMORE, Esq., examined.

659. (*Chairman.*) You are engineer to the river Lee navigation?—Yes, under the Trustees.

660. Will you state what their proper title is?—The Trustees of the river Lee.

661. Are they constituted under an Act of Parliament?—They are constituted under several Acts of Parliament, they were finally incorporated in 1850.

662. I presume that the most recent Act of Parliament defines the constitution and qualification and other particulars?—Yes; I have requested the secretary to prepare a short paper referring to those matters, which, when completed, he will put in.

663. How long have you acted as engineer for the Trustees of the river Lee?—For about 16 years.

664. For what distance is the river Lee navigable from the Thames?—From the Thames it is navigable to Hertford, a distance of about 28 miles. Bow creek is also under the jurisdiction of the Trustees; that leads from Bow to Blackwall, and is a natural creek of the Thames. The jurisdiction of the Trustees does not extend up the Stort branch, which is about 13 miles from near Hoddesdon to Stortford.

665. Does the jurisdiction of the Trustees extend to the junction of Bow creek with the Thames?—From Bow locks to the Thames there is a mixed jurisdiction, for the Thames Commissioners are as much masters there as the Trustees of the Lee.

666. Do the works belong jointly to the two bodies?—There are no works on that part; it is a natural river with banks, subject to the control of the Level Commissioners.

667. What is the length of that part of the navigation?—About $2\frac{1}{2}$ miles.

668. Then there are three bodies concerned in the lower or tidal reach of the navigation, the river Lee Trustees, the Conservators of the Thames, and the Essex Sewer Commissioners?—Yes, they have one side.

669. They have charge, I suppose, of all the lowlands, the marshes ditches, and embankments?—Yes.

670. I believe that body nominate three members on the West Ham Local Board?—Yes, they do.

671. Have you acted as engineer for the commissioners of sewers?—Yes; for several years.

672. Was Mr. Walker their engineer before that?—Yes. I was consulted by them for several years before his death, and two years before his death I was appointed.

LONDON.

N. Beardmore, Esq.

11 Dec. 1866.

673. In constructing the Victoria Dock works, what body would have been consulted, the river Lee Trustees or the Essex Sewer Commissioners?—The Essex Sewer Commissioners entirely; the Victoria Dock works enter from the Thames. The Conservators of the Thames no doubt had control over the entrance works. I may say that great improvement in the drainage of the marshes was effected when these docks were formed, arising out of the construction of the docks, but their formation has also brought about complications as to the drainage which are still unsolved; on the lower side there is a strip between those docks and the Thames, which is awkwardly situated.

674. Do you mean the part on which Silvertown is erected?—Yes, it is quite out of the Lee.

675. That strip, by the construction of the Victoria Docks, has been cut off from the general area of the marsh?—Yes, but it does not suffer so much for that reason; it is becoming a great town, and the West Ham local board has not yet constructed sewers there; it is a very difficult thing, unless some new scheme is introduced, for them to do it.

676. At what date was the river Lee first formed into a navigable river, was it navigable before there were locks upon it, or do you know the origin of the navigation?—Our first navigation Act was passed in the reign of Queen Elizabeth, but it must have been a navigation of some kind long before that. I have little doubt of that, because the Danes went up the river Lee in the time of King Alfred as far as Ware, but no doubt in those days the marsh was more of a morass, and consequently the navigation would have been easier. I have no doubt that in those days there were rough kinds of weirs, that is the original kind of weir; whether there was anything like a scientifically formed weir I should have a doubt, but I think there were most likely weirs to fish with, with arrangements for boats to go through, and for the trouble taken in letting them pass through a toll was paid; we know that a toll exists to this day. I have very little doubt about it, because I have seen the same on some of the rivers on the continent. Those who had fishing weirs, made arrangements to pass the barges, and they were paid a trifle for each; there is a vestige still left of the the old weirs, and the property in them has come down by inheritance; when we dredge in the present river we now and then come across one of these old weirs. After Queen Elizabeth's time they became regular weirs formed by the commissioners; they were made scientific constructions, and the old weirs exist in the bottom of the river to this day; there is one close below Ware, and that has not been used for 100 years.

677. (*Professor Way.*) I suppose as there is nothing above the water there are no tolls levied now?—No. When Smeaton formed his design for canalizing the river, the weir owners evidently appeared in Parliament and made the Trustees pay them compensation for abandoning their tolls, and fixed payments were maintained in the Act that was passed. As to some of them we do not know where they existed. I do not know at least where one or two of them did exist, and yet a sum of 20*l.* or more a year was paid for them in compensation. A man would have said, you will destroy my property by making the new cuts, and therefore you must pay me. These places are spoken of in our Acts of Parliament as turnpikes, I believe legal ones; since Elizabeth's time they were, I think, treated as turnpikes; they may have varied in construction, but no doubt the system still exists, and you can see it upon other rivers. In the first place two piles were driven down into the river at a distance apart which would admit the largest barge, then there were sills, and those piles were connected with the shores by wings; on one side of the piles there was an iron pin, and a beam swung upon that iron pin; this was the turnpike, that beam was confined at the other end, and then upright boards were put in one after the other to pen the water up.

678. (*Mr. Harrison.*) There are such weirs existing now above Oxford on the River Thames?—Yes; and also on the river Nene and on another river near Bury St. Edmunds. We have, as I before stated, from time to time grubbed up these materials, and I rather guess that they were of the form I have described, and that the turnpike was that swinging beam; from which we get the name of turnpikes on the roads. Tolls are mentioned as payable at such places as Waltham turnpike, which is a water passage on the old river.

679. I suppose that the name "Ware" comes from a weir on the river?—I have not the slightest doubt of it.

680. What is the geology of the Lee?—Down to the parallel of Cheshunt it is chalk covered by beds of sand, gravel, drift, and clay; some small extent boulder clay exists still in part of the valley, and the district varies greatly in the amount of the drift. Some of the upper valleys have vast beds of gravel, sand, and tertiary drift; there being in some other valleys surface clay, and patches of boulder clay.

681. If you could strip the alluvium from the chalk you would probably find a distinct set of contours and pot-holes in the chalk?—Certainly.

682. The valleys between the ridges and pot-holes are filled in by drift?—Yes.

683. Therefore, I assume that a bore-hole in any one part of the valley would not be a sure indication of what it would be in another part of the same valley?—When you come to the higher parts of the valley, there you would always find chalk nearer and more certain; but the valleys themselves vary greatly in the amount and character of the drift. The charm and beauty of the Lee, as a water bearing country, are in fact that it is a great natural filter; there are some of those streams above Hertford that never flood nor overflow except with very unusual rain. When the Great Northern line was cut, you could see the beds of fine sand running from 10 to 15 feet thick, and those beds prevail largely; indeed over at least 150 out of the 444 square miles above Fielde's weir, they are of that fine character.

684. Would you say that the Lee is essentially a spring fed system of rivers?—Most essentially of the spring water character, surface water drains out within three days of a flood, sometimes within two days; in the earlier part of the winter and in the spring the flood water passes off, and the gauging shows that the river is mainly composed of spring water almost immediately.

685. (*Mr. Harrison.*) With almost a steady supply?—Yes. During the last month we had a flood, and within a week the river had gone back to its normal spring volume.

686. (*Chairman.*) Are you able to name the principal springs upon the tributaries and upon the main river of the Lee, where they are situated, and their probable volume?—The river Mimram is a large spring of water. The rivers Beane, Rib, and Ash to a great extent are composed of spring water, but with no very large springs on either of them showing anywhere.

687. (*Mr. Harrison.*) Do you find that there is an accession of spring water into the beds of those rivers throughout their course?—Yes; they are so highly porous that the springs must come from the hills into the marsh, and then down into the bed of the river; they are not very perceptible.

688. There is a constant accession of volume as the river proceeds?—Yes. On the river Mimram I do not think it is possible to build so as to foul the stream unless you have pipe drains. It is absolutely a rural district, and there is nothing to foul it. It is so porous that it would be difficult to do it, except by pipe drainage going down to the Lee Proper. The upper part rises with springs direct out of the chalk above Luton. The river has a gradual accession of water, but not by means of any large prominent springs that I know of until you get below Hatfield, and even there I know that the bed of the river is a vast deposit of sand. It flows in a porous sand bed with

LONDON.

N. Beardmore, Esq.

11 Dec. 1866.

chalk not very far off; the water passes through the sand, and in a very dry time portions of the valley will drain by natural filtration. Two miles below Hatfield the springs present themselves in a very large form; they are to be seen boiling out on the hill sides. There is one very considerable spring at Woolmer Park, but that spring being one of the higher springs fails in a dry year, for at least three months. In the last 15 years that spring has twice fallen off from August to October.

689. (*Chairman.*) Is that a spring which is known in some districts as a levant, or in others as a bura, or are there intermittent springs which appear and disappear?—We have no such name; it is a fine boiling pool, under a chalk cliff. You can see the gravel and sand on the chalk when not grown over with shrubs and creepers.

690. You say that it is intermittent?—Yes, so far so that in a dry year it has fallen off and come to nothing.

691. The flow ceases?—Yes.

692. Do you know the Bourn at Croydon?—Yes.

693. Which only breaks out after there has been a certain rainfall?—I know nothing of that kind in the Lee valley; it is all too highly porous and consequently the flow is more regular. These springs doubtless prevail, but not visibly, all the way down to Hertford, because the Lee Proper increases in volume and becomes there a very considerable stream. Below Hertford the first large spring that you meet with is the one that was taken originally by the New River Company, the Chadwell spring, which is between Hertford and Ware; below Ware, the western side of the valley becomes a succession of boiling springs all the way down to Hoddesdon; the last great spring is at the Hoddesdon Mill. The volume of that spring is not less at any time than 300 feet a minute. There appears to be a fault in the valley at Broxbourne; I think the London clay exists below the parallel. Comparatively speaking there are not many springs below that point, but if you bore through the clays and drift you will find boiling springs again, showing that the whole valley is full of springs which cannot come out on account of the weight of the clays, the mottled clay, and the London clay lower down than that. These springs will boil up as far down as Edmonton. There is one which has been bored within seven years, which is now running over in ample volume at the roadside near Angel Road Station.

694. The word "boiling," I presume, is not used as having any application to heat, but simply to coming up and flowing over?—Merely this, that they come upward and flow entirely over.

695. Did you ever test the temperature of any of those springs?—I have often tested them.

696. What is their mean temperature?—According to the season; they vary from 51° to 53°.

697. Or from 48° to 50°?—I do not think that the mean temperature goes as low as 48°. They vary with the latitude.

698. (*Mr. Harrison.*) Will they not vary to some extent with the depth at which the spring is seated?—I think you would get in the winter a more uniform temperature, nearer the mean temperature of the latitude; less according to the mean temperature, and more according to the latitude. A deep spring will vary less, and that is the difference.

699. (*Professor Way.*) If the springs are in large volume, I suppose the surface does not affect the temperature?—No, they follow a fixed law. I tried some springs the other day in the centre of the coldest part of Russia, and they followed the same law.

700. (*Chairman.*) Have any records of the rainfall been kept upon the river Lee?—Yes, I have kept one at Fielde's weir for 16 years.

701. Shewing the least and the greatest rainfall, and about the average?—Yes, and I will put that in. (*The witness subsequently furnished the same. It will be found printed at the end of his evidence, Appendix No.* 1.) About four or five years ago I published a statement, and that I will refer you to; it gives almost as good a statement for 10 years as you can have. You will find it at page 346 in the tables contained in "Beardmore's Manual of Hydrology, 1862." (*See end of this witness's evidence, Appendix No.* 6.)

702. Have you any gaugings of the flow of the water, its minimum and maximum, at any fixed points upon the river?—I have kept for 16 years gaugings at Fielde's weir, where I consider the maximum of the spring water obtains, or nearly so.

703. What variations have you found in the flow of of the water;—The variations between a wet year and a dry one is very considerable, and perhaps I might almost say that that would be rather better given in the form of a table, for it is so very difficult to give all the figures in any other way.

704. Will you be good enough to give us the highest and the lowest and the mean?—I will refer you to the best gaugings on the Lee; that I can supply, at page 151 of the same book (*see end of this witness's evidence, Appendix No.* 2); but I will also furnish you with the details of the year 1858. (*The witness subsequently furnished the same, and it will be found printed at the end of his evidence, Appendix No.* 2.)

705. (*Mr. Harrison.*) Referring to that former table, can you give the rainfall down to the present time?—Yes, I will give you a further table. Referring to the minimum flow of the river Lee, at Fielde's weir, I think the years of 1857–58 will afford a good specimen; in that year the minimum of the month of August, after the New River Company had taken its supply, was 2,073 feet per minute, but for supply purposes you should take the mean of that month; in August 1857 it was 3,654 feet after the New River Company had taken their supply.

706. Was that the dryest season?—Yes, that I consider to have been a very dry year. We had also a very low discharge in October 1854. The mean of that month was only 3,041 cubic feet per minute at Fielde's weir after the New River Company had taken their supply. Under such circumstances you may take it, according to my experience, that it was entirely and absolutely spring water.

707. Can you give us the volume in September 1865?—The mean flow of the river at Fielde's weir was 4,550 cubic feet per minute, inclusive of the water flowing towards London through the New River.

708. Have you a return which has been kept continuously of the volume of water passing down the river?—I have kept records continuously, but they are not yet calculated up. I do it entirely as an amateur matter, but I have not got them yet quite complete. I will have some of them prepared.

709. (*Chairman.*) With the knowledge you possess of the river and supposing that the navigation question could be superseded and the water supply could be made permanent, would it be difficult to secure for the metropolis a supply of spring water at all times, putting aside also the amount of money that might be required to accomplish that object?—Not in that sense I think, because the spring water flow is collected from such a large area, and you must have the surface flow mixed with it when there is rain.

710. You think that you could not insure, by any system of collection or by conduits, a supply of the largest volume of spring water the river and streams are capable of yielding?—I think it would be a very difficult operation and an expensive one, for you would have to drive into the very neighbourhood where your collecting places would be liable, from being lower than others, to collect the foul drainage, in that would be the difficulty, because the whole valley is so porous, that driving for springs in that way must lead to your getting sewage and drainage water.

711. (*Mr. Harrison.*) You mean that at present the water comes from below, and if there was sewage or any matter of that kind above it, and you were to tap from below, the sewage would follow and be mixed with it?—That I think would be the difficulty. Take the valley below Ware as an example; at the bottom of the valley drift there are large boulder stones, and even in some cases rubble chalk, that have fallen down

from the hills, this substratum is teeming with springs, and when they boil out they flow over the ground and come into the river. The difficulty of the sewage question is that by touching anything like the valley itself you would run the danger of getting the sewage into the water ; at the present time from a large majority of the buildings along the valley the sewage never gets to the river at all, they have cesspools of their own and drains and ditches and so on and it filters through and evaporates.

712. (*Professor Way.*) To carry out the supposition of the chairman, if any scheme could be devised with any hope of success for securing a supply of spring water, the interception of the sewage would in all probability form a part of that scheme, so that the fear of pollution would not exist ?—You must keep them very clear of each other, and I fear if you did that to any beneficial extent your volume of water would fall off and you would not have supply enough ; you would have to be so careful to shut out foul drainage, that you would have to shut out clean water. This difficulty has arisen at Hertford ; the town was sewered by the New River Company, with the object of carrying the filth past and below the point where they took in their water, it being manifest that the town standing so close to the source of supply did not give nature any time to act to get rid of the bad effects of the sewage ; the town was sewered through open gravel and the consequence has been that the New River Company have drawn a great quantity of fine spring water into their deodorising beds, which is a waste of the water, and oftentimes there is a very great difficulty in deodorising ; they could not help it, for when the sewer was laid down in came the clean water.

713. If the bed had been dry the sewer water would probably have mixed with the spring water at another place ?—Yes, it might.

714. (*Chairman.*) At the present time works are being carried out on a gigantic scale on the south side of the river ; they have also been in progress on the north side for the low level metropolitan drainage. Do they, or do they not, shut out the foul water from those sewers ?—They do not, I should say, shut out any ; they have sucked out the water from everywhere. I was concerned in a case at Hackney where it was found that the sewer had taken away everything from some very valuable springs which used to supply some ancient watercress beds which were originally established there in Sir Joseph Banks's time.

715. Do you think that that is an absolute taking away of water by the internal conduit, or a draining away along the external line of the sewer in the gravel from the ground having been broken ?—Originally, no doubt, it was a draining away on the outside, but I believe it got into the sewer eventually somewhere.

716. That is to say by filtration or bad joints ?—By bad joints I should think.

717. I think you will find that Mr. Bazalgette, who is the engineer for the works, professes to keep the drainage out ?—They say that not a drop came in in the first instance. The impossibility of doing this, however, was shown in the Lewisham road case. The Kent Waterworks Company contributed towards the construction of a sewer for the sake of carrying the sewage from the Crystal Palace away from their source of supply ; the sewer was laid in drift of precisely the same character as the drift in this case ; the springs poured into the sewer and they never succeeded in keeping them out. The springs disappeared from the ornamental gardens and from the brook altogether, and the Kent Waterworks Company have in consequence entirely altered their system of supply. The sewer took the brook water as well as the sewage, every effort was made to keep the water out and enormous expense was gone to to line the sewer, but in spite of everything the springs blew in the work. I do not mean to say there are many such springs within the metropolitan area as would act in a similar way and you may be correct in thinking that the drainage of the water is by the side of the sewer and that it gets away, but if you were to apply the same law to collecting sewers up the valley of the Lee you would find the same thing happen. I myself built a lock near to the Amwell springs, and it was blown up by the springs just as if a barrel of gunpowder had been placed under my works.

718. The springs lifting the work bodily ?—Yes, and blew it up ; the difficulty there was enormous. I got down into boulders, chalk and large boulder-stones which prevail there, and the water boiled up in a manner that I had never seen before. In the Lewisham sewer, a year after it was made, you could see the springs boil up in the middle of the sewage from the bottom.

719. (*Mr. Harrison.*) Before the passing of the sewage into the metropolitan sewer, did not a large party of gentlemen pass through on the occasion of the sewer being opened, and go and inspect the reservoirs ?—Yes.

720. At that time was there any water coming in to any great extent before the sewage entered ?—That I cannot speak to.

721. Do you not think it would have shown itself then ?—I cannot tell you, but where the metropolitan middle level sewer goes there are large beds of gravel which are full of springs, and they have had to lay little pipes into the sewer by scores, so that anybody might now go into the middle level sewer in Finsbury and Bethnal Green and collect sweet drinking water fit to supply the population if it were not for the locality.

722. Do you think the springs are under considerable pressure there ?—No. That sewer is constructed as it were on a hill. It is not the condition of things that I spoke of before where the springs boil out on the river Lee, but the springs generally flow in through pipes. You may see them in the sides of the middle level sewer.

723. (*Professor Way.*) The engineer of the metropolitan board, I think, does not say that the subsidiary or secondary sewers are water-tight by any means ; he only claims exemption from leakage in the main sewer. The water that you speak of may come in at some short distance from, but yet not in the main sewer ?—Yes, that is what I mean. The water may pass along, and by and by it will come to some place where they have put a pipe in and so it is let in.

724. (*Chairman.*) Is any part of the river Lee embanked above the tidal influence ?—Small portions of the navigation are embanked, which has the effect of keeping the floods off the neighbouring lands, but not to any extent, or beyond what is necessary for the due management of the river itself.

725. Up to what point in the Lower Reach does the tide flow ?—A very high tide would tail up to Lee Bridge mills.

726. How many miles up would that be from the Thames ?—Five miles.

727. Is there any record to show the period when the river Lee and the Thames along the marshes there were embanked ?—No, but it must have been at a very early date. We know from the annals of the city of London that the corn required for the use of the citizens was ground at the City mills at Stratford, and those mills could not have existed without embankments ; they were essential to them. When I say that no part of the river Lee is embanked, I exclude the part which lies below Old Ford where it is all embanked.

728. What is the rise from the Thames up to the highest point to which the river can be navigated ?—The highest point is 119 feet above Trinity high-water mark ; that is the level of Hertford Pond.

729. What is the whole distance ?—It is nearly 28 miles from Limehouse, taking the whole length.

730. What number of locks are there upon that length of the river ?—There are 20 locks, besides six extra flood and tidal locks or stop gates.

731. At what date was the earliest masonry or timber lock of an ordinary character constructed on the river Lee ?—They were built by Smeaton. I have

LONDON.

N. Beardmore, Esq.

11 Dec. 1866.

always considered them to have been built by Smeaton between the year 1770 and 1780.

732. They were perhaps the first that were constructed in England?—I do not know.

733. It has been stated that Brindley constructed the first locks on the Bridgwater canal, but that is not correct?—I should think so. I believe that ours were not the first that were constructed in the country.

734. Is it your opinion that Smeaton was the first person who improved the river Lee navigation?—We know that he laid out the works, and that they were executed under his general advice. No doubt other engineers were called in occasionally, but Smeaton laid out the line of the navigation as it is defined by the Act 7th Geo. III. cap. 51. His works have since been improved on the same general course.

735. Are all the locks now in existence that were designed and constructed under Smeaton?—Many have been removed and others altered in situation; the fall of two or three locks has been concentrated into one in several places.

736. Were they made of timber, or brick, or stone?—The waist, platforms and foundations were of timber, but the upper and lower recesses for the gates were of brick.

737. I suppose with piling between?—Yes, there were piles placed about 16 feet apart with horizontal campsheeting.

738. What is the greatest and the smallest lift?—Smeaton laid them out for about a maximum of three feet draught of water, and a rise of about four feet, but now they have been very much increased. The width of his lock was 13 feet, but the width of the present locks up to Enfield is now 18 feet 6, and above Enfield the locks are made 16 feet wide.

739. What is the length of the locks?—96 feet from centre to centre of the gates.

740. What is the greatest lift that you have on the river Lee?—About 9 feet 6, except at the tidal lock at Limehouse; that will lock down to 13 feet fall, according to the tide. There is no doubt that a line should be drawn in forming locks so that there should not be less than 6 feet, nor more than 9 feet of fall The loss of water is enormous in a 9-feet fall, and the loss of time as well, with a greater fall.

741. Have you what are termed side ponds on any of your locks for the purpose of economising water?—There is a lock at Tottenham which has a side pond.

742. Does that enable you to save half the water?—Yes. We have also double locks at Old Ford, and they can be worked one against the other as side ponds. Those works were carried out in the year 1856.

743. (*Mr. Harrison.*) And since you have been engineer?—Yes.

744. (*Chairman.*) What is the present draught of your boats and the tonnage?—The present draught is four feet in order to get to Hertford, and six feet to get to Enfield. With regard to the tonnage, the maximum tonnage that can be carried to Hertford now is about 85 tons, and that with difficulty. The maximum tonnage that could be conveyed to Enfield would be from 100 to 110 tons.

745. Is there any steam navigation on the river Lee now?—Not practically to any extent. The Trustees do employ a steam barge, which answers well and has done a great deal of work.

746. Is there any steam towing or are the barges themselves worked by steam?—No, not besides the Trustees' own steam barge, excepting this, that the Grand Junction Canal Company send a pair of boats to Enfield lock now and then, but that is not done to any very great extent; they have steamers on their canal and they send a pair of boats sometimes which carry iron to the Royal small-arms factory at Enfield.

747. Is the towing done by horses?—Our towing is done by horses entirely.

748. I assume that the towing-path belongs to the navigation, but do the powers of the trustees extend to any defined line beyond the towing-path on one side and the water on the other, or do the water and the towing-path limit them on both sides?—Except on the old river, the bank on one side and the towing-path on the other are the boundaries on the cuts which form the major part of the navigation as defined on the section I have put in. The foot of the bank on each side is the boundary, or where there is no bank there is generally a defined boundary, but upon the newer portions of the river the Trustees have acquired land with fixed boundaries; they have a good deal of wharfage ground.

749. When the navigation was first formed and before much improvement had been carried out, do you know what the practice was, if the channel altered its course in any way, or the towing-path was washed away. Had the Trustees power to form another, irrespectively of any riparian rights to keep up and maintain their navigation?—I believe that the Trustees were kept to their line as a general rule; whether in olden times they did not evade it and whether they did not gradually encroach on the land is perhaps doubtful; but in my time, when I have had anything carried away during a flood I have attempted to restore it.

750. Is the ownership of the soil vested in the Trustees, or is it claimed in any way by neighbouring riparian owners?—It is vested in the river Lee Trustees. The opinion of counsel has been taken on the subject, and the different Acts of Parliament distinctly vest it in the Trustees. In that respect the river Lee Trustees are different from any others in England, the soil is vested in them and they are a body corporate; they were made a body corporate in 1850.

751. Do you find that much or any dredging is requisite in order to maintain the navigation?—A great deal of dredging is required in the lower parts of the valley where the sewage comes in, and that is gradually increasing and more dredging is required.

752. What is the material that is generally brought up, is it gravel, or sand, or filth?—There are certain points such as Limehouse cut and the Bow river, and to some extent near Tottenham where what is dredged up is sewage; but we have been gradually deepening the river, and so up to this time we rarely dredge without taking a good deal of clean gravel out; that is in the lower part. In the upper part of the river there is very little to dredge out except gravel and sand, but at certain points were the cut is entered from the old river, the floods form banks of silt which has to be taken out. These, however, are localised points that we know, so that we can go to any point after a very heavy flood and do what is necessary.

753. Have you any surface scavenging carried out under your directions or have your banksmen instructions to scavenge and cleanse the surface from weeds and floating carcases?—Yes; we cut the weeds and we dredge on a regular system. The officers employed on the river Lee are required to get out and bury any carcases, but these are very rarely seen above Tottenham. Latterly, in the Limehouse cut and all the way up the river towards Tottenham, there are in hot weather a considerable number of dead dogs and other things, but we have systematically had them collected and buried, and so got rid of.

754. Have you laid down any regulations with regard to bathing within your jurisdiction?—No very strict regulations; we warn parties against bathing so far as our jurisdiction extends; but there are parts of the old river in a few convenient places where bathing goes on without any control being exercised by the Trustees, but not to any great extent.

755. Do the Trustees claim the ownership of the fishing rights, or do they in any way regulate or license the fishing?—No; the fishing generally is held by private owners; the Trustees by the right of purchase are the owners of some fishing; at all the weirs, they catch eels; but those fisheries are let where they are worth letting.

756. What mill power is there upon the Lee that belongs to or is in any way controlled by the Trus-

tees?—I may say, generally, that nearly all the mills from Ware to Lee Bridge belong to the two water companies or the Trustees, with the exception of one at Broxbourne and the Government mills, from King's weir down to Enfield.

757. What kind of mills are they principally?—They are flour mills almost entirely with one or two exceptions; there is a chain of powder mills from King's weir down to the small-arms factory at Enfield.

758. Which are the Government mills?—Yes, these all belong to the War Department who allow their surplus water to grind corn at Waltham, and the water power at the small-arms factory turns grindstones for sabres.

759. Do you know anything of the river tributaries beyond your jurisdiction above you and up towards the sources?—I know them generally.

760. Are there any mills on the tributaries?—Yes, a great many, but they are entirely corn mills; I think there is scarcely an exception; there may have been one small paper mill near Luton some years ago, but I doubt whether it is there now.

761. Do any of those mills that you know of use steam as an auxiliary?—Yes; steam has been very much introduced.

762. As an auxiliary to water?—Yes, as an auxiliary to their trade, the demand increasing. A man cannot work a mill to any advantage unless he can draw plenty of wheat through it, and so he puts on steam; it is not altogether an auxiliary to water.

763. I need not perhaps ask you whether you would restrict the putting of ashes into the river within your jurisdiction or not, but suppose a man burns coal to any large extent and he puts the ashes into the stream, of course, you would complain of that?—Yes; but I hardly think there is a ton of ashes thrown into the Lee in a month; they are too valuable.

764. Because they are so well checked within your jurisdiction?—Nowhere on the Lee is it done; there are no steam mills of any importance above us at all; within our jurisdiction I should say that there is not a ton of ashes thrown in in a month.

765. As to the condition of the streams above you, do you think that any solid refuse is put in by riparian owners or by persons having access to the river at any point?—A little perhaps at Stortford; it is not as sweet as it should be there, and I think there must be some come in from Ware.

766. You think that as a rule the river is not subject very much to abuse from being polluted by solids or obstructed?—As a rule, I think not much above Waltham.

767. Have the river Lee Trustees any jurisdiction above the point to which they navigate to prevent such a state of things if it exists?—The Trustees have no jurisdiction beyond being the body who can make a legal complaint to the Court of Chancery and obtain an injunction; they can do nothing more than that, and that is a most expensive and troublesome process.

768. You can put in force the common law of the land which is applicable to nuisances?—Yes, but not any special law; that is what the Trustees very much want.

769. There is I believe no such body as a conservancy having charge of the entire valley of the Lee and its tributaries?—No; that is what is wanted, and that is what did occur to me when I was called in in 1850 as being a most desirable thing to have, that the Trustees should be a drainage board as well as a river board.

770. You say that the river or the navigation is now managed by the Lee Trustees, but supposing that persons above your jurisdiction thought fit to abuse the river by casting in solids, there is no recognized body whose duty it would be to step in and immediately prevent it?—No.

771. The offenders would have to be indicted by any parties who chose to take the matter up?—Yes, they must either proceed by indictment at common law, or move for an injunction in the Court of Chancery.

772. Would you be surprised to learn that in Yorkshire and other parts of the kingdom ashes are thrown into rivers and streams by thousands of tons annually, that foundation materials and road scrapings are thrown in in the same large quantities, and in fact every form of solid refuse, and otherwise, is thrown in because a river happens to be near, and it is cheaper to throw it in than carry it anywhere else?—Yes, I am aware of it; but I can san say absolutely that such a practice as that does not prevail at any point in the valley of the Lee. The river is owned by millers and landowners to such an extent that they would immediately stop such a state of things, because if permitted it would immediately affect the next mill below. I can give you an instance; in Luton there was a board of health and some years ago they began to foul the river, but a large landowner close below commenced a Chancery proceeding against them, and he holds them under terror to keep all the solid matter back, and practically, I believe that Luton does not hurt the river in consequence. By clause 109 in the 7th of George the Third, it is enacted that "if any person "shall wilfully throw ballast or gravel into the said "river, cuts, or canals, he shall be committed and "put to hard labour for a period not exceeding three "months," but that only applies to the river as a navigation.

773. (*Mr. Harrison.*) For a considerable distance the navigation and the river run parallel?—Yes.

774. Have the Trustees of the navigation any control over that part of the river?—No, very little indeed; nothing more than if there was any overt act by which the river was damaged, coming in afterwards into the navigation, then the Trustees would, by common law, have a right to complain.

775. They do not take any steps to keep it at a proper depth, or pass over the water in any way?—They have no interest at all in any way in that.

776. There are some parts of the river which have been canalised?—Yes.

777. In those parts of it, are you obliged in the summer time to give any considerable fall to the water?—No, there are very fine deep reaches in the river very much like the Thames, and we keep them perfectly clear, we keep them regularly dredged.

777*a*. I see that you have deepened some of them considerably?—Yes; we also dredge after gravel for profit in some of these rivers, and some of them are very fine deep rivers.

778. In those parts where the river has been formed into a navigation, have your improvements had the effect of passing off the floods more rapidly than before?—Very much so; in the last 10 years the valley has been sensibly improved in its drainage by the works which have been carried out by the Trustees.

779. Does that remark extend to those parts of the river which do not form part of the navigation?—Not entirely, but partially it does. There are certain portions of the river, say between King's weir and Chingford on the Essex side of the valley, that are comparatively in their natural state still, because they are only relieved by the improved navigable river in one or two parts in the whole of that distance.

780. Is the effect of passing off the floods more rapidly from that part of the river which forms the navigation to expedite the passing down of flood waters from those parts which do not form part of the navigation?—Yes; all that has been improved, but there are portions of the valley which are left in their original state.

781. Has the effect of the improvements that you have made in the parts of the river that form the navigation been to pass off the floods more rapidly, but to pass them on to parts of the river not under your jurisdiction, and which remain in their primitive condition?—Yes, to some extent that is so; but as the river has to pass at many points through the new navigation, the general effect has been to get the water

LONDON.

N. Beardmore, Esq.

11 Dec. 1866.

off the valley more quickly, at the same time, as I have said before, there are some portions between King's weir and Waltham and between Waltham and Chingford which are not much affected by these circumstances.

782. Would it be beneficial to the whole of the valley of the Lee if the other parts of the river were placed under the jurisdiction of the Trustees of the navigation ?—Certainly a great deal of improvement might be effected if there were means for it; some of the rivers are in a disgraceful state, the banks are allowed to grow up, and the place is left like a morass.

783. Is there much land flooded in consequence of that ?—Yes; there is a good deal of land overflowed by the floods, but that is in the winter months, and the lands are not very valuable; they are left in a half soddened state, and water logged, both from a wet winter and a wet summer; the people do not seem to value the lands much, and many of them are lammas lands.

784. That is to say, lands upon which the occupiers of adjoining land can put their cattle for a certain period during the year ?—Yes, but those lands are getting gradually enclosed.

785. Do you know whether the effect upon the health of the people is marked or not ?—The truth is that there are so few people who live in those water-logged parts that I cannot tell you, no one indeed lives there, they are neglected places.

786. Are the lands so injured by that condition of things that an improvement to the land would pay for an improvement to the river if it were placed under the jurisdiction of the Trustees of the Lee ?—If the commons were enclosed it would; not otherwise, as long as they are commons and open lands there is not sufficient ownership in them to make it worth while. When they get enclosed you soon see an improvement take place; they make partial embankments and deep ditches, and so on. We have had a marsh in Nazing opposite to Broxbourne very much improved in the last few years; besides being enclosed it was drained. The surveyor laid out a drain at my suggestion through that marsh, which has very much improved the land altogether.

787. (*Chairman.*) I assume that all those marsh districts are considerably above the level of West Ham marshes ?—Yes; they have got plenty of fall, all of them.

788. It would be simply a question of embanking and keeping the floods from them, and getting an outfall by a cut down to the lower district ?—Yes.

789. You could drain any one of them ?—Yes, and there is one very strong instance of that where I hope this will be carried out some day, and that is the large marsh which lies below Lee Bridge. That marsh ought to be enclosed and the river-course improved, and part might be laid out as a park for the people. I may mention that the marsh is very much frequented by the poorer orders of London during the summer time, and it would make as pretty a park as can be imagined, if properly laid out, with the river Lee like a lake in it.

790. Is that marsh now common land ?—Yes, and it is in a most disgraceful state.

791. Who is the lord of the manor ?—I do not know exactly; Mr. Tyssen is lord for part.

792. Is the valley of the Lee in any shape or way a manufacturing valley in any part of its area ?—Not in that sense above Enfield. The powder mills can be scarcely called manufactories, at all events it is one of the cleanest and quietest manufactures that can be carried on, they occupy about three miles of the river; but below Enfield we are gradually getting manufac-factories. One has been lately established as large jute works at Ponders End, and a large floorcloth manufactory has been erected in Edmonton parish. There are also some manufactories at Tottenham that drain into the Lee below Tottenham lock.

793. Is jute Chinese grass ?—It is a vegetable fibre that comes from the neighbourhood of Calcutta, an Indian fibre, and it is now forming the basis of everything; they say that they even adulterate silk with it. Nearly all the coal sacks and flour sacks are made of jute now; it looks like hemp, and it is a charming article, but it has one drawback, that it will not stand wet; wet causes it to rot immediately.

794. Are there any fords in the river in the valley of the Lee ?—There are a few fords in the old part of the river, but all the main lines of communication are bridged over entirely, and the old fords have disappeared.

795. Has there been any extensive system of land drainage in any part of the valley, or does the subsoil not require it ?—The subsoil does not require it, the river Lee valley is healthy for that reason; there is a wonderfully free percolation of the water through.

796. (*Mr. Harrison.*) In the upper parts of the basin which are chalk would agricultural drainage be at all affected if it were carried out ?—There is no occasion for it, it drains so excessively freely in the valley of the Lee. The malt trade of the Lee arises from the fine free quality of the land, growing as it does such excellent barley, it was carted down to Hertford and Ware and made into malt, and then sent by water to London; that was the origin of the Ware trade in malt.

797. No agricultural drainage would diminish the volume of water coming into the river from that area? —No, nothing could be done to affect that.

798. (*Chairman.*) In the course of our inquiries we have had very strong opinions expressed by many persons that from some cause or other, our climate is altering, that drainage or clearing of the land is gradually reducing the rainfall, and diminishing the floods. Do you believe that that is based upon any reasonable foundation; for example, taking the valley of the Lee, is that as subject to floods now as it was in a former period ?—I should think so. I believe that there is to some extent a popular error on the subject; floods will come occasionally in such a valley as the Lee, but a bad flood comes but rarely; there was a terrible one in the month of May 1824, and there was a very bad one in November 1852. Again there was flood that topped the one of May 1824 in October 1857, but since then we have had no flood at all that has been equal either to the one of November 1852, or the one in October 1857, so that I might say that now great floods seem to be disappearing, as we have had none for so long. I think people forget these things, and we might run on till such a period as has elapsed, as that between May 1824 and October 1857, before we get another. While the present elements of nature exist, I apprehend that we shall in this climate be subject to these irregular periods of drought, gradually merging into wet periods, which prevail according to something like a law. We got into a dry period in 1865, and no doubt we have run into a wet period again, we had a wet period in 1860 or 1861; the summer of 1861 was marked by floods through the summer.

799. In our first inquiries in Yorkshire, for the first 3 or 4 weeks every witness, without any exception, was quite satisfied that there would be no more floods, but before we had completed our inquiry there was destruction caused by a flood, such as the oldest inhabitant could not recollect ?—Yes, and so it will be everywhere, people are apt to forget what has already passed. There is one point touching this inquiry to which I may refer, namely, that in a valley like the Lee which is so full of porous grounds it is a long time before dry weather loses its influence. I attribute the low state of the river in 1865 to be the excessively hot weather of 1864. The wet marshes were cracked open, so that it was dangerous to walk across them between July and September, 1864; you might have dropped an umbrella out of sight in some of the cracks, many of which did not close up all the next winter of 1864–65.

800. And very probably they never would be watertight ?—The water certainly during all the next year did not appear as usual in the river; so that the cause of the river being so low in 1865 was the drought of 1864.

801. (*Mr. Harrison.*) What is about the level of the water shed of the river Lee within range of the chalk hills, how much does it rise above the sea?—The top of the range is about 450 feet, and the general average of the county round Hatfield may be said to be a great plain, with deep river channels cut into it; this table-land is from about 300 to 350 feet above Trinity high-water mark.

802. At what depth below that do the springs appear?—About 150 feet, they begin to boil out at about 150 feet below that level, and they cease to boil out when you got to about 80 feet above Trinity high-water mark.

803. Is that cessation in the boiling in consequence of the London clay overlaying?—I think so; underlying the drift and London clay, you get too far from the sources of the water to give fall enough for the water to come up with the same force, and you get an additional depth of drift and mottled clays, and then the London clays, which keeps down any tendency the water might have to rise. The Lee is a filling valley down as far perhaps as the parallel of Cheshunt; below that there is not much feed into it, except land springs and flood water. The lower part of the valley has a great thickness of pure green sand reposing on the chalk; near Ponder's End there is 70 feet of this material; the whole depth to the chalk being about 100 feet. At Tottenham lock the London clay is close to the surface, and is many feet thick.

804. You gave us the minimum volume of the water you had recorded as passing after the abstraction of water for the New River Company at Hertford?—Yes, as passing over Feilde's weir.

805. Where is that?—At the junction of the Stort and the Lee.

806. That is after taking in all the springs intervening between Hoddesdon and Hertford?—Yes, with one exception; that gauging does not take in a large spring at Hoddesdon. Hoddesdon mill and other springs are not included in that gauging.

807. Do you know what they are?—Hoddesdon mill spring discharges about 300 cubic feet a minute; 2,700,000 gallons a day.

808. There is a large drainage south of Hatfield where you may see plenty of swallow holes; Have you examined that district?—Not much.

809. It is of very considerable extent, is it not?—Yes.

810. All the water passes away?—Yes. I think they are not so much swallow holes as vast beds of sand. There may be swallow holes underneath and the water gets away. The bed of the river below Hatfield park has swallow holes. The Marquis of Salisbury took me last year over the bed of a pond on the river course from which he had diverted the river. He made a dam across the pond and laid one part of it dry and the water was going through the bottom of the pond, which was of fine sand.

811. That water no doubt passes into the chalk and finds its way out below?—Yes, not far below.

812. It was suggested to us in a former inquiry by Mr. Bailey Denton, that advantage must be taken of the drainage of the clays in certain places by passing it into the chalk in that way so as to increase the perennial supplies to the springs in the river adjoining; do you think that it is at all impossible?—I think there may be places where it would be very possible, but I could not apply such a scheme to any part of the valley of the Lee.

813. Go to the valley of the Stort; do you know the geological character of that valley?—It has a very great deal more of clay. The river Stort quickly floods.

814. Is it from the Stort that the floods chiefly arise in the lower parts of the valley?—Not chiefly, but in a great deal larger proportion than from the other parts. The river Stort is very foul when it floods.

815. Does it fall down to a great extent in a dry summer season?—Certainly it falls off comparatively to nothing, and in that respect it shows its clayey character.

816. Is that the case with the Ash also?—Yes, the Ash is a steep river also. I do not think that the Ash has so much clay in it, but it is a steep river, and it falls off very much. It floods rapidly after a certain amount of rain. None of those other rivers flood after the first rains. We have a regular monsoon in this country as in India. For example, we have our first warning rains, and then in October we have a heavy rainfall; it is very rare that we do not have a flood in October, when whatever collection may have taken place in the ditches of the upper country gets washed out and the water comes down very foul for the first 24 hours, when a flood has got to its maximum it comes down foul, but after that the water soon becomes clear. I can mention an instance which has occurred in the last week. The river was in a high flood on the 7th of this month and the water was then foul, but on the 9th it got nearly back to a fine and clear condition. I was surprised on Sunday to see it a fine magnificent volume of water, nearly clear, although so shortly after a high flood.

817. In the river Thames from observations that have been made by Mr. Simpson, it would appear to take nearly 30 days after a heavy general flood before the river assumes the appearance you described just now, indicating the springs at its source?—Yes, but it is very different in the river Lee, because we are so much nearer the spring head and get so much larger a proportion of water from the springs.

818. And more rapidly passed into the river?—Yes, I can assure you that it is a matter of fact that on the 7th of this month the river was in a state of high flood, and on the afternoon of the 9th one half of the whole volume of water was spring water. I know it by former gaugings, we had only got volume enough in the river, but so small a volume was it reduced to that one half of it was spring water; the river was falling off to a wonderful extent.

819. Have you made any observations at Hertford so as to determine approximately the quantity of water that is evaporated from the surface above Hertford?—No, but I know a great deal about it from the gaugings made at Feilde's weir, and from comparing the quantity that flowed off with the quantity of rain that fell.

820. Will you be kind enough to state the result of your observations there?—I will, if you please, answer that question by referring you to the table, where taking the depth of rain actually run off at unity, the rain gauge showed 4·26 in 1851; 4·35 in 1852; 4·29 in 1856; and 4·74 in 1858. In other words for every inch available as water supply in 1851 there was 4·26 inches of loss and so forth. (*See end of the witness's evidence, Appendix No. 2.*)

821. I believe the New River Company take water not only from the river Lee at Hertford and from the Chadwell spring, but pump also from wells?—Yes, they have pumps near the springs but they pump very little.

822. You stated, I think, that there would be a difficulty in drawing a larger quantity of water from the wells for fear of having the sewage flow back through the chalk or gravel; do you anticipate that that would be an obstacle to your drawing a larger quantity from the wells than you do now?—If the water had to be taken in that way upon a large scale, that is if it were collected by culverts upon a large scale, I apprehend that at the same time you would take care to have a proper system of sewerage upon a large scale, and I think that the two things together would be liable to clash. I have always looked at that as one of the difficulties in foul draining the valley of the Lee, that you must lay main sewers where the fine water is most plentiful. Wherever you attempt to lay a sewer in the valley of the Lee you find yourself taking in beautiful spring water. Carrying on works as I have done, I have found that when I have attempted to pump the river out in order to construct locks, it has been the most difficult engineering operation to get

LONDON.

N. Beardmore, Esq.

11 Dec. 1866.

rid of the water that comes from everywhere, it is in fact to pump the whole district round.

823. Do the East London Waterworks Company take the water from your navigation, or from the old river?—From the old river. Under their Act of 1852 they were empowered to cut the navigation off from the old river in several places so that the old river became the carrier of pure water for miles above their point of abstraction; consequently their supplies are not affected by the navigation at all until above Ponder's End.

824. Then the navigation above a certain point acts partly as as a subsiding pond for their water supply?—Yes; if it does take in the sewage and the stuff carried down by the floods, it settles in other parts of the navigation.

825. At the lower part of the river you stated that there were two miles and a half which were jointly under the jurisdiction of the river Lee Trustees and the Thames Conservators?—Yes, we call it technically the Bow creek.

826. To what height do the ordinary spring tides rise there?—The rise of the bed of the river between Blackwall and Bow Lock is about 7 feet at low water, and the tide at Bow Lock rises 13 feet.

827. What is the difference in the level between ordinary spring tides and ordinary neap tides?—About 3 feet 6 at high water.

828. Is there any large extent of surface of the bank and bed of the river that is exposed between those two points during neap tides?—Yes, there is a good deal of bank, and all the Lee waters ebb out, so that the river is a mere stream at the bottom of a large muddy creek.

829. Therefore for some days there would be a considerable area left without being covered at all with water during the 24 hours?—Yes.

830. Of what area do you suppose that must be?—In acreage perhaps 10 or 12 acres.

831. What is the condition of that surface?—It is ooze and mud with a few reeds growing in it; there is a good deal of reed shore above the influence of the neap tides, but below the spring tides.

832. Is there much sewage matter carried up from the metropolitan outfall and from the West Ham works into that portion of the river Lee?—Since the middle of August last we have been very much relieved of anything from the metropolis, for they have set a temporary pump to work at the West Ham station, and they pump it now under the Lee, but there are many outlets still which are not connected so that we still have sewage coming in. There is a very annoying place at Bow brewery; there is also a newspaper factory and a soapworks near Old Ford that cause a great deal of nuisance; on the whole, however, we are very much better than we were. West Ham drains into the tidal creek below Barking iron bridge, and that does not help to mend the creek by any means; when the Metropolitan Board's pumping engines set to work at the Abbey mills, the West Ham drainage ought to be dropped in there; their culvert goes close to it, and some arrangement, I think, must be made to send it down there, unless the West Ham local board make their own pumping station near Barking. There is this disadvantage, that when the tide returns up Bow creek, it brings up anything through our flood gates; it flows to Old Ford lock on one side, and towards Limehouse on the other; but bringing in the sewage from the Thames, and being locked in as it is at Limehouse and at the Bow gates, of course what sewage there is drops to the bottom of the river, which renders it unwholesome in hot weather.

833. Is it worse than it was before the completion of the sewerage works?—Yes, it has very much increassd in the last year or two. Then the Tottenham drainage also coming in deteriorates the quality of the water, and we suffered very much from it, both in 1864 and 1865, and last summer but in a less degree.

834. Was there a considerable nuisance caused by it then?—Very great, and that is a thing that will grow, although they have taken it away from the metropolis. If something is not done with the Tottenham sewage above, we shall be liable to have the same nuisance where, until the last few years, it was a very beautiful river; that is, above Lee Bridge. In my opinion, some large scheme ought to be devised to carry away the drainage of the valley then.

835. It would appear that London has removed its drainage to your neighbourhood, and that you feel the disadvantage of it?—Yes; now that London has got rid of its difficulties the suburbs are increasing and the evils are repeating themselves. I have prepared this map (*handing in the same*) for the purpose of explaining the new state of things; this map is a general sketch showing the state of the valley below Edmonton at the present time.

836. Are you sufficiently acquainted with these parts (*pointing to the map*), Poplar, Blackwall, and Limehouse, to say whether they are above or below the level of high water?—The greater portion of that district is below the level of high water. In addition to that there was no efficient system of sewerage carried out; the inhabitants were of a very low class, and very badly built houses existed all over that district.

837. I believe the low level sewer has been partly carried out?—It was, in fact, at the time of the breaking out of the cholera, complete throughout the district but they had no outlet at the end. They are making from the low level, or they have made, a deep sewer into the Poplar district, running under the Limehouse cut at Bromley lock, which is just completed; one was also contemplated under the Victoria park approach to drain the Isle of Dogs.

838. The condition of this district (*pointing to the map*) at the breaking out of the cholera would be very similar, would it not, to the condition of that district on the south side of London where it broke out on a former occasion?—No doubt of it; and there was quite enough to account, I think, for the breaking out of the cholera, in the filth of some of the places here (*pointing to the map*), without looking to abstract theories. The first cases of cholera that we heard of at Bow were those of a man and his wife who worked in a small factory by the side of St. Thomas's millstream. A great many people work there, and in a very small building; they had an abominably foul ditch by the side of the factory, and this ditch was cut off from the general West Ham sewerage district, and was in fact illegally fouled by this factory and by some other nuisances above. The street in which the cholera raged so badly in Bow was close behind Lloyd's paper works, and the smell from a brewery and the stuff from Lloyd's paper works occasionally was of the foulest description. About six weeks ago I had occasion to visit an enclosure close by the newspaper works at the end of this street (*pointing to the map*), and I was convinced that there was quite enough to account for the cholera appearing there.

839. Where does the discharge from the paper works find an outlet?—Into the river Lee, close below Bow bridge. There was a smell from Esparto grass in the tanks. There was a sort of faint smell from it that was dreadful, and the closeness of the place was something worse than I ever experienced in my life, that was where the cholera broke out.

840. Is the part you have referred to below the level of high water?—No; it is on the side of a hill facing the east.

841. Are you aware whether there was any obstruction to the free passage of the sewage from Poplar about that time consequent upon the flaps being out of order?—I do not know. I had a great many men at work at Limehouse at the time, and knowing that cholera was raging so badly I of course made my inquiries, and it appeared that at the time of the outbreak there was scarcely anybody who was not seized with diarrhœa. I do not believe we had a man among the 60 who were there employed who was not ill in that way.

842. Was the effluvium from the river, and in the district bad at that time?—The effluvium was very bad.

843. (*Chairman.*) Do you know what the ordinary condition of Limehouse cut is?—The ordinary condition of Limehouse cut has been very fair during eight or nine months of the year ; but it has been very bad in dry, hot, summer weather in the last four or five years, within which period factories have been increasing, and sewage has been increasing from the metropolitan area.

844. It has been literally, has it not, an open cesspit?—It has been a good deal like it.

845. Was it not so in the last spring?—I think from about June.

846. When the cholera broke out?—Yes.

847. An open continuous cesspit?—Yes, as foul as it could be.

848. Are you aware that a barge load of blue vitriol was sunk in the middle of it, which throughout its whole length entirely disinfected it?—Yes. It must be remembered that we labour under other difficulties which must be explained. All the fresh water that we have flowing down the river is divided into five parts, so that several of these streams (*pointing to the map*) also are water-logged, and get foul. Then there is a reservoir there (*pointing to the map*) that it would be very desirable to close up ; it collects mud, and I think it ought to be closed up. An improvement might be made also in the drainage of this district and the cleanliness of it if there were means at hand. We can help ourselves in foul times by opening the gates at Bow locks into Bow creek. We do that, and we almost always do it on Sundays to clear it out and to draw the water off the land generally, but the collection of mud increasing in these other rivers (*pointing to the map*), there are dead ends to them that we cannot draw. Much good, however, might be done. We do all that we can to draw off the water from the surface, but the difficulty is this, when you get a very short water time and hot weather, the drawing off is no longer of any good, for the smell from the river that has been drawn is worse than when the river is kept up. The foul water that passes down Bow creek never gets away ; it is pounded up, and comes back to us the next tide. During the past two summers I was obliged to keep the water up instead of drawing it off. When the autumn water comes, or we have had a wet summer, we can draw these places off, and they can be kept comparatively sweet.

849. (*Mr Harrison.*) Have the trustees any control over these branches (*pointing to the map*)?—No ; they have no control over any but their own branch down to the Four mills. The others are private branches. One belongs to the East London Company, two to the city of London, and one to Christ's hospital. There are the means of getting a very great improvement made here (*pointing to the map*) ; this part might be very much improved if we could cut the river off there (*pointing to the map*) and turn part of this ground into a park. It is all open common now.

850. (*Chairman.*) Have you had any communication recently with the West Ham authorities relative to their sewerage?—The trustees of the river Lee have not had any communication with them, but the Essex Sewer Commissioners have had a communication with them. The Commissioners have offered to give them every facility they could, but nothing tangible has been done yet.

851. Had not the local board some understanding, or did they not obtain some sanction from you as engineer relative to their outlet?—Not the Trustees, but the Essex Sewer Commissioners sanctioned a new wall for passing the outfall through their embankment ; beyond that they have had nothing to do with it. At Barking iron bridge the Commissioners also sanctioned the making of another outfall.

852. (*Mr. Harrison.*) Is that portion of the land (*pointing to the map*) water-logged or liable to be flooded?—It is not flooded at all, or very rarely ; the West Ham sewers now underdrain it completely. There are still some islands above the Stratford road which are not connected with the West Ham sewerage, and they are more liable to be water-logged.

853. What is the substratum of this district (*pointing to the map*) which is marked "Poplar" and "Bow"?—It is a fine bed of gravel and sand.

854. How far does it extend from the river inland?—In all directions ; to Hackney, Homerton, Victoria park, and Bow common. They are all on a great bed of gravel and sand.

855. (*Chairman.*) All this district (*pointing to the map*) is more or less peaty and compressible?—Yes. The district I have just spoken of is bounded by the Limehouse cut and the river Lee. When you get into Poplar you get to the marsh in the same part of the river, there the London clay does not exist, and you have drift, and peat, and gravel.

856. Have you ever had occasion to use the ordnance bench marks in this part of the district (*pointing to the map*)?—I have used them.

857. I wish distinctly to say that any person wishing to refer to ordinance bench marks, ought never to refer to them anywhere near where the metopolitan drainage works have been carried out, or anywhere within the area of West Ham, or the flat district where the sewers have been carried out ; houses, streets, and bench marks have been lowered from 6 to 7 inches, and in some instances 12 inches by gradual subsidence from the draining of that site?—Your remark applies, I think, to the east of Bow creek. The West Ham sewerage drains that district very completely, and the only fault that it has is that it does not go far enough, it requires now to be carried farther ; a new outfall is wanted now at Barking creek or somewhere else.

858. (*Mr. Harrison.*) Were you consulted at all when the outfall was made for the West Ham sewerage?—Yes, so far I was consulted that I advised both the Trustees of the river Lee and the Essex Sewer Commissioners that the outlets must be only looked upon as temporary only, inasmuch as the metropolitan drainage works were then being commenced, and it was only a question of a few years when proper relief would be obtained for the district, without throwing the sewage into Bow creek.

859. The outlet was made under those conditions?—Yes.

860. So that the West Ham board of health are now under an obligation to remove the present outlet, and discharge the sewage at some other place?—Yes, and they must do it; it cannot be deferred much longer.

861. I dare say you remember that Mr. Simpson mentioned at the Institution of Civil Engineers, some gauging which he had made on the river Churn above Cirencester, showing that the volume increased from the Seven springs down to a certain point, and diminished after that ; so that at a certain distance below the source it was reduced to nearly the volume obtained at the Seven springs. Have you observed any such phenomenon on the river Lee as a loss in the volume of water below a certain point?—I have not in that sense, but I have no doubt that it does occur at Hatfield. I have no doubt that the river is lost to a certain extent and then comes out again above Hertford in the form of springs.

862. Can you say that from actual observation?—No.

863. Is there any stipulated volume of water for the use of the navigation?—Yes, that is all set out in the Act of 1855, the whole agreement in fact is embodied in that Act. The companies have their shares as between themselves, and with regard to the river Lee Trustees, a certain volume is set apart for the river Lee Trustees when they want it.

864. The volume which you have power to take is 3,500,000 gallons a day is it not?—The Trustees can take for the use of the navigation, from the upper reach above Feilde's weir 3,600,000 gallons per diem ; between Feilde's weir and Waltham 4,500,000 gallons per diem ; between Waltham and Old Ford 5,400,000 gallons per diem ; below Old Ford lock, all the surplus water belongs to the navigation. By the River Lee Water Act 1855 the Trustees are bound to undertake

LONDON.

N. Beardmore, Esq.

11 Dec. 1866.

new works for improving the water supply at the expense of the companies if they require such; if consumption of water in the navigation is to be reduced the Trustees may be called upon to execute the necessary works under similar conditions; but practically there is not much water wanted for navigation, compared with the resources of the river. If the companies wish to exercise their powers we can reduce the quantity of water consumed in the navigation to a very small quantity. The quantity of water which the New River Company could draw before 1855 was limited by the marble gauge, but the Act of 1855 removed all restrictions and divided the water in certain proportions to the New River Company and the East London Waterworks Company, and then after these certain proportions had been received they took half, foot for foot, each of them. Under the powers of that Act, the New River Company laid down pipes past the marble gauge, and they also put in a new balance engine; their supply was very much increased indeed, no restriction was put upon it, and a new balance engine was put in, the old legal quantity was removed, that is to say, the quantity mentioned in the reports and so often spoken of as going through the marble gauge was altered by the Act of 1855.

865. (*Chairman.*) What is the working establishment employed by the Trustees?—It varies.

866. There is a paid secretary, is there not?—Yes, and a paid engineer, also bankmen and dredgermen.

867. Are they paid out of the funds which the Trustees have at their disposal?—Yes.

868. I think you have stated that the Trustees are not paid?—Yes.

869. Do you know whether they have any capital account?—Yes; we have always been carrying out large works on borrowed money.

870. They mortgage their income to raise the money?—Yes.

871. And they pay interest upon their debt?—Yes.

872. What is the present amount of the debt?—The clerk will be better able to state that.

873. Since you have been engineer to the trust have they expended much money on new works?—Yes, a very large sum.

874. Can you state the amount in round figures?—I should think they have expended at least 160,000*l.*

875. In what number of years has it been laid out?—In 15 years.

876. Was the whole of that money borrowed?—Not entirely. Under the Act of 1855 the New River Company contributed 30,000*l.* towards the works; the money was laid out specifically in new locks and works. The New River Company paid it in aid of a better water supply for the metropolis.

877. Has the East London waterworks contributed anything for similar purposes?—Yes, they contribute in the form of income.

878. Do you mean for works which have been executed?—I mean generally towards the funds of the trustees.

879. What do they pay you now?—2,000*l.* a year.

880. Is that 2,000*l.* a year to be a perpetual mortgage upon the trustees for works accomplished, or will it cease at any time?—No, it is a perpetual income contributed towards the resources and for the purposes of the trust.

881. In consideration of certain sums of money laid out at some former period by the trustees?—It was generally in consideration of sums to be laid out.

882. In the event of any conservancy being set up, do you think it would be compatible with the constitution of the trustees that they should become conservators if the necessary powers were tendered to them for acceptance?—Do you mean that they should become conservators and drainage commissioners?

883. Yes. Conservators and drainage commissioners for the entire valley of the Lee?—My opinion is that it would not be convenient for them to become drainage commissioners anywhere above Hertford. I think that above that town it should be left to the different local parts, but I think there should be power given to prevent nuisances being committed, and that some such powers should be conferred upon them, as have been recently granted to the river Thames Conservators, that is to say, if the authorities in any town chose not to drain properly, the trustees should have the power to go in and execute the necessary works, and charge the town with the costs, and levy a tax upon them. I am strongly of opinion that something of that kind ought to be done. The great difficulty is to force people to do what is right; unquestionably something ought to be done with the drainage of Bishop's Stortford, but unless the whole navigation of the Stort was vested in the Trustees, which might be inconvenient at the present time, because it is private property, it might be difficult to deal with it. I think that parties who are at such a distance as Bishop's Stortford should be left to carry out their own drainage, but that the Trustees should have power to go in and do it compulsorily, if after a certain number of years notice they did not do it.

884. The river Lee Trustees holding in trust the main navigation in the lower part of the river do in a measure hold the key to the whole valley, do they not?—Certainly.

885. Would it in your opinion be a convenient arrangement to establish a new form of conservancy to have jurisdiction over that part of the valley where they would be liable to come into collision with the Trustees?—I certainly think there would be no objection to that on broad principles, the subject is of course quite new to me, and in what form it should be I am not prepared to say.

886. You think there would be no objection to a new conservancy?—No, I think not as to the lower part of the valley; to deal with, say, the valley drainage below Enfield or below Broxbourne, something of that kind is called for because the Trustees now only hold the position of objectors general to everything, and it would be more convenient for everybody if they could say "Very well, "if you will not put this place to rights we will do it "for you and tax you for doing it." It certainly is a case, I think, in which it is possible to form such a body.

887. The Trustees you have said are unpaid?—Yes.

888. Then by what interest are they moved or what is supposed to be their interest in the navigation?—To keep it sweet and pure, that is all.

889. Are they large riparian owners?—Some of them are; not all by any means. The members for Hertford, Essex, and Middlesex are *ex officio* members of the board, so that in fact the whole of the contributing area is represented on the board.

890. When you have board meetings, does anything like the whole number of the members attend?—No; the *ex officio* members do not attend the meetings much. We emanated originally almost from the city of London, the mayor, the corporation, and aldermen are members of the board, and sometimes they take a good deal of interest in the meetings.

891. Is it true that the great mass of the business is transacted by a very few members?—Yes, there is a working board; I think that that works better.

892. Is the work done by a committee selected from the entire board and appointed by them?—No, it is not done by a committee but by the board.

893. Do you mean that a certain number are nominated by the rest of the members?—No, there is no nomination. Notices are given to the whole body; we have no committee for the monthly meetings.

894. But I suppose there are some members whom you never see, and others whom you see frequently?—Yes.

895. In the event of the Government desiring to interfere with the valley of the Lee and with the present arrangements for sanitary purposes, do you think that a large or a small board would be most eligible?—I really have not formed any opinion upon the subject, but practically our board may be called a small board.

896. Should a board having such duties to perform as those which are entrusted to it be, in your judgment, an unpaid or a paid board?—I think it would be rather better if there were a small payment.

897. Do you think it would come within the range of your duties to act as engineer for a conservancy board and at the ame time to act as engineer to the river Lee trust?—Certainly; the engineer of the river Lee could act much better and more effectually if he had the drainage under his control, and if there were funds to carry out improvements; the great thing is to have the sinews of war: you cannot deal otherwise with such a matter. The river Lee Trustees have no funds at present with which to deal with these things, and it is a great grievance, I think, to have perpetually to go to law for the purpose of restraining or punishing wrong doers.

898. Do you think that if the river was to be managed by a conservancy board for the benefit of the riparian owners and the towns on its banks; for the benefit also of the navigation and the different water companies, it would be an equitable and unobjectionable way of raising an income to levy a rate upon all persons who should be directly or indirectly benefited?—I cannot answer that question quite in the form in which it is put; my opinion is, however, that to a small extent taxation ought to be laid upon those towns that are drained into the river and who thereby compel the Trustees to incur expense in various ways. On the other hand the people might say, referring to the way in which you have put your question as to their being benefited, "We are not "benefited; it is true that our drainage is passed "into your river and you say that it may damage it, "but if you put us to any expense we shall not be "benefited." In the sense in which I have explained it I should be inclined to tax those persons whose drainage formed the very subject matter with which you had to deal.

899. Then you would take an area supposed to be directly or indirectly affected by the river and also benefited by the works which had been executed in it?—Yes, because the land to be benefited by mere drainage is practically *nil*. You could get no taxation out of any absolute benefit done to the land; you must take the broad principles as laid down in the Public Health Act and tax them broadly; not upon the old system, viz., that you could only tax parties whom a jury of 12 men would say were benefited; that is the essential difference between old sewer law and the new board of health law. The board of health takes a district; they do not look very minutely into the question of who is benefited, but they take a whole district, and they tax the people in that district.

900. From your knowledge of the valley of the Lee, do you think you could define a limit beyond which you should not go, but within which taxation should be imposed?—Not at the moment, but I think there would be no difficulty in doing so.

901. That will be a matter for consideration?—Yes.

902. The taxation you have suggested would be imposed under parliamentary authority?—Certainly, there should be taxation, but people should not be taxed by the Trustees direct, but a law should be passed as in the case of the county rate, to levy a certain amount of taxation on each district in a lump. The Trustees should not collect the money.

903. But do you mean it to be handed over to the fund in charge of the Trustees?—Yes.

904. To be expended by them, and that they should publish annually audited accounts?—Yes, I may say that the Trustees do that now, but no doubt there should be accounts published drawn out with great minuteness, and there should also be an annual report presented to Parliament.

905. For this purpose, of what do you think the establishment should consist in addition to a secretary an engineer and the staff which he might choose to appoint under him?—I should think not much more, there would of course be inspectors required, and they would act under the secretary or engineer. It would not require the machinery of a very extensive staff, but if such a plan were carried out there must be some very extensive works carried on in the neighbourhood between Tottenham and Stratford in order to get rid of some portion of the foul state of things which exists down there; that must be their work, and there must be a large outlay of capital if the works are to be completed, and a general system adopted; the mere working of the thing need not be an expensive matter.

906. In the event of any large works being devised and sanctioned by Parliament, or by some properly constituted authority, the engineer, I presume, would either let them by contract, or he would have power to call to his aid persons who were required to superintend and carry out the works?—Yes, the works would be planned and carried out and the capital expended. I thought that your first question applied to the annual expenditure.

907. Have you seen the scheme as drawn up by Mr. Bailey Denton called the Lee Valley and Ham Marshes Sewage Bill?—No.

908. How many lock-keepers have you at present? Have you a resident lock-keeper at each lock?—Yes, on the average we have quite one per mile.

909. I assume that the whole of their time is not occupied in the duty of lock-keeping?—Pretty much so; the work is too much for them to get away much from the lock.

910. Do you know how your income and expenditure balance at the present time?—I think that perhaps the clerk will answer that question better than I can, but they balance very fairly. On the whole we do very well. The trade very much increases.

911. Do you regulate your rates in proportion to your income, or are they fixed?—We should regulate them according to the income. We have practically a fixed amount, and if we find ourselves short of money, we try to economise in our work for a year, and not to do so much. Ever since I have had to do with the river we have always been improving, putting substantial works instead of old ones.

912. Is there anything which you think you can add to the evidence which you have so kindly given to us?—I may mention that the East London Company have deposited plans in the last month for diverting the future drainage from Waltham, Cheshunt, &c. I have not had an opportunity of seeing those plans, or knowing anything about them, but they would touch the question of the general conservancy of the river, and so on, and perhaps rather increase the desirability of having something done.

913. That question will come before Parliamentary Committees in the next session?—Yes.

914. Is there anything further which you would wish to add?—Nothing occurs to me now. I shall be most happy to state anything afterwards, if it should occur to me.

915. Are you also engineer for the New River?—No. I may say that the New River Company last year called upon the Trustees to execute a new work near Hertford in order to get the water better to London, and that was paid for by them in addition to the 30,000*l*., and that is one of the works which either they or the East London Company could call upon the Trustees to execute under the powers in the Act of 1855.

The witness withdrew.

APPENDIX No. 2 to the Evidence of N. BEARDMORE, Esq., C.E.

RIVER LEE, HERTFORDSHIRE. DISCHARGE OF THE VALLEY AT FEILDE'S WEIR (including all water taken into the New River above that place).

Drainage area 444 square miles; height of district from 80 feet to 500 above the sea; mean 240 feet. Length of main river 31 miles, of tributaries 92 miles above the weir; which is above 20 miles from the Thames at Blackwall.

Extract from "Manual of Hydrology," by Nathaniel Beardmore, Esq., Civil Engineer (referred to supra, Question 704).

Year 1851.

* This month had the heaviest floods known all over the Eastern Counties, and basin of the Thames; they happened during the week of the funeral of the Duke of Wellington, and the flood is generally called after his name in consequence.

LONDON.

Mr. C. Greaves.

11 Dec. 1866.

Mr. Charles Greaves (London) further examined.

916. (*Chairman.*) Have you anything to add to your former evidence?—There are one or two points which you asked about yesterday. I was asked the proportion of houses having watercloset arrangements. I am not able to furnish that information at all distinctly as to the whole district, because we have not before in going through our district counted up that particular distinction of closet fittings and no closet fittings, but in a survey which is at present in progress I have it partially done. I can give you an enumeration of two districts; in one or them out of 5,938 houses, 4,509 have closets and water supply fittings to the closets; in the other case 8,474 houses include 4,611 closets.

917. Do you think that those would be fair average proportions for the whole of your 90,000 houses?—I do not see why the proportion of the whole should differ from that, it is a large proportion.

918. (*Mr. Harrison.*) It is very nearly a closet for a house?—In the first case there is a larger proportion of closets than the second.

919. (*Chairman.*) Is there any other documentary evidence which you have to give?—I am not prepared with anything else.

920. (*Mr. Harrison.*) We have had evidence from Mr. Beardmore this morning as to the point to which the spring and the neap tides rise in the river. The difference of height he mentioned as being about 3 feet 6 between the ordinary spring tides and the ordinary neap tides, is that about correct?—I should think so.

921. He also stated that he thought that the banks exposed to the action of the sun during the neap tides would be about 8 acres; those are the banks at the tidal portion of the Lee?—That is a point upon which I can hardly make an estimate.

922. Do you think that it so much as that?—I should think quite that, because a very narrow strip over several miles of river would make eight acres.

923. Mr. Beardmore also mentioned that there was a considerable deposit upon that area so exposed, and that there was a considerable effluvium arising from it during the hot season and during neap tides, causing a nuisance in the neighbourhood?—There is no doubt that in hot summer weather the smell from the river is at times dreadfully offensive, but how to distinguish between the smell from the water itself and the smell from the banks is perhaps a fanciful thing to assert.

924. Is the smell as great when the tide is in at a full spring as at other times?—No.

925. Mr. Beardmore also stated that that nuisance had increased since the execution of the metropolitan sewerage?—Since the imperfect development of the main drainage.

926. Do you think there is a point up to which it attained a maximum, and that it has been diminishing since then?—Decidedly; because the public outcry throughout the whole of the eastern district against the discharge which was taking place from the unfinished main drainage system was sufficient to induce the metropolitan board to put up temporary pumping engines, by which the evil on that account was very much diminished, and they are now lifting a very large proportion of the low level sewage into the main drainage pumping station.

927. Are your old reservoirs on the banks of the tidal portion of the Lee?—They are.

928. And they are within the influence of this area so exposed during the neap tides?—Yes.

929. For what length of time has the water been stagnant in those old reservoirs?—We call them the uncovered reservoirs; I should say since they were disused, which is since 1855.

930. The water has not been replaced by a fresh supply?—Only in a small way, not by any emptying and filling again, or anything of that kind.

931. From whence do they receive the supply to replace evaporation?—At present they have neither inlet nor outlet; but, as I described in my evidence yesterday, they were connected with the disused canal coming down to Lee Bridge, and if they lost more than we could otherwise supply it was within our power to fill them up again from that source if they did not get filled by the overflow from the filtered water aperture.

932. Do you think that those reservoirs adjoining the Lee, and subject for that number of years to the gases arising from the waters of the Lee, would imbibe a portion of those gases, and would become foul from that cause?—I never thought so, nor is there any evidence that they are so excessively foul. No doubt the deposit in the bottom is not so sweet and clean as the water in the upper part, but they are generally bright, and sometimes very bright.

933. Do they vary in appearance at the surface?—Sometimes they are a little cloudy, and sometimes they are excessively bright, because warm weather will cause water to become cloudy by producing vegetation in it.

934. In your opinion does the brightness of the water at all determine the purity of the water?—Not altogether.

935. (*Chairman.*) I think that Mr. Harrison has put the question whether the evaporations and the emanations from the surface in the spring of this very year were not very foul through the open ditches, the open cuts, the open river, the mud banks, and in the case of all the surface evaporations in that district, which give off foul gases?—I do not know that that state of things was particularly prevalent in the spring of this year, but the discharge of sewage from the incomplete main drainage works reached the culminating point in this year, and the local member of the metropolitan board strenuously urged the damage which this was doing to general health, and induced that board to establish a pumping engine to lift the sewage from the special low level branch sewer which takes up the Hackney district, anticipating what will be done for the whole of the low level sewer when the pumping station is complete.

936. How long does your filtered water remain in the low-water reservoir as a rule before it is used? If it is filtered to-day is it in the services on the same day; have you not a very large storage of pure water?—No, but I do not withdraw from the storage which I have, more than one-third of its depth on any day. I am not speaking exactly to figures, but that is nearly about the proportion.

937. Are you pumping the fresh filtered water as it is filled?—No, the pure water reservoir holds three times what is taken out of it in the course of a day.

938. Is that the upper or the lower pure-water reservoir?—I am speaking of the Old Ford covered reservoir, it holds three times what I draw out of it in the course of a day, the one third which I draw out I fill up again in the course of the following night, and therefore, it is as if you took a bottle and drew out one third of its quantity and filled it up again.

939. Then very little of that water is exposed to the evaporations, contaminations, and deleterious influences of which we have been speaking?—Very little; I should say that there is no contamination.

940. If you have an open reservoir of several acres in which the water, however bright, has been standing for several weeks, that water has been exposed very much longer than the other water to any deteriorating influences, if they have any action upon water?—Decidedly, that is clear.

941. Do you know chemically that water has a powerful affinity for various gases?—Yes.

942. And that a very bright sparkling water may surcharge itself to a very great extent with gases?—Yes.

943. Ammonia for instance?—Yes.

944. It may absorb many times its own volume, that is to say, that a cubic foot of water may absorb many feet of ammonia gas?—I am aware that the quantity is large.

945. You are aware that in a soda-water bottle the gas is in volume many times the quantity of the water in the bottle, it being under pressure?—Yes.

946. Then it is possible that the water in the open reservoirs, although apparently bright, may be in a very different condition to the water supplied to your customers?—Yes.

947. (*Mr. Harrison.*) In consequence of the length of time that it has been stagnant in the river Lee?—I think that that is a fair conclusion.

948. You mentioned to us yesterday that you had known a case where gas had mixed itself with the water supply?—There was a sort of inhaling of the gas just by the fracture of both gas pipe and water pipe. The water running away drew the bulk of the gas into the pipe. The two pipes were broken and the breaks were near one another, and as the water-pipe emptied itself by the water running away it filled itself with gas, then the supply of water coming in at the other end pushed the gas forward and made it burn at the tap.

949. Considering your intermittent system of water supply is not such an accident as the fracture of a gas pipe, and a leakage into your water pipe, a case likely to occur?—It is so rare that it could not be considered as one of the accidents to which pipes are liable.

950. You have put in a number of reports for the last few months. At page 277 there is this observation, "One of these reservoirs was recently emptied and was "filled again. These old reservoirs are not used, the "covered reservoirs containing the only water fit for "use." Can you say whether or not there is any truth in that statement?—There is no question that the larger of the two uncovered reservoirs was emptied by special steam power into the Pudding Mill stream.

951. When was that?—At the beginning of this year, in the spring, when we had under consideration an abandoned notion of extending the covered reservoirs at Old Ford.

952. How was that reservoir filled again?—Partly by rain, and partly by the leakage from the adjoining reservoir, which was full.

953. Can the water soak from the adjoining reservoir into this reservoir?—It appears that it did. The northern reservoir was full, and the southern reservoir was empty.

954. How far were they apart?—Only about the breadth of this room, and there was no substantial barrier between them; in fact, only one, which having been damaged, it had not been thought necessary to repair.

955. Did you observe at the time how the reservoir was filled again?—I stated that opinion myself to Dr. Frankland, not exactly in those words, but that it had acquired water again by rainfall and by soakage from the adjoining reservoir.

956. What period did it take?—Some weeks. We never had it full. There has been more made of the fact than was right, but there is no question that the bottom of that reservoir is not tight.

957. What is the subsoil under that reservoir?—More gravel than anything else.

958. In a case of that sort there is a communication between that gravel and the reservoir, so that the reservoir can be filled from the gravel below it?—I suppose so.

959. Does that gravel bed pass under the river Lee adjoining?—I do not quite know where the division of the strata takes place, but there is a considerable difference in the character of the sub-strata on the line of the river there.

960. What is the level of the water in the open reservoir when full, as compared with high-water in the river Lee?—I should think that it was rather above Trinity, but tides of course rise above Trinity.

961. Then do you think that the water in the reservoir would be nearly level with spring tide Trinity?—Yes.

962. What is the depth of the reservoir?—It is 10 feet deep.

963. Then might not the leakage be from the river as well as from the adjoining reservoir?—When water rises in a soil which is permeable, it is of course difficult to say where it comes from.

964. The point from which you take your supply I think is some distance above the tidal influence altogether?—A long way, not only in distance, but in height. There are two locks, and two mill-falls between.

965. You are now, I think, authorized to take 23,000,000 gallons a day?—That is not the proper definition of the quantity which we are authorized to take.

966. Is that about it?—No, I cannot say that it is. The New River Company are entitled to take 2,500 cubic feet a minute at the first cut out of the river up at Hertford; then the East London Company are entitled to take a similar quantity. That is the way in which the priority stands. We hold the whole river. The river is committed to us, barring a certain quantity which is given to the Trustees for the purposes of navigation only. We divide the river between us, but there is a certain priority which has arisen out of the old standing of the New River Company, and their better position as to level, being higher up the river.

967. At present you have about 20,400,000 gallons, that is, of clean water in fact?—Yes.

968. Mr. Beardmore has said that you take your supply from the river proper, and not from the canal?—Yes.

969. You mentioned yesterday that the water is carried in a channel of 100 square feet down to the settling reservoirs?—Yes.

970. How frequently is the channel cleared out?—Two or three times in a year.

971. Is the water let off, and is the mud cleaned out?—We get it out pretty clean, but we send it forward; we open the sluice and send it down.

972. You send it into the river Lee below?—Yes.

973. Then you get it clean in that way?—We wash out all the mud, and we can get it cleaner in that way than in almost any other possible way.

974, How many settling reservoirs have you into which the water from that channel is conducted?—The whole area of the reservoirs which may be called settling, or storage reservoirs, is divided into fiv

975. So that you can cleanse each of them alternately?—I could do so, but they are of recent construction, and their cleansing is not a point which has become necessary yet; they could not be emptied without steam power.

976. Can you empty one part of this storage area and leave the remainder?—The five I could empty in three sections.

977. And you could leave the others in action?—Yes, not precisely, but to some extent I think. Reservoirs of that kind acquire a very small amount of sediment on the bottom.

978. How many years have they been in operation?—Only since 1863.

979. Have you any knowledge of the deposit which now exists?—There is no appreciable measurement of it.

980. Do you find any effects during hot weather, or during a change of weather from the condition of the water arising from that deposit?—Not arising from the deposit.

981. Do you find any effects from any circumstances?—The water changes its appearance and character on the surface, with changes of weather. It has at times an apparent tendency to vegetation in the warm weather; you see something preparing to start into life upon the surface.

982. What do you think that that arises from?—It is very difficult to trace the progress of these seeds of vegetation, or where they start from, or how they are disseminated.

983. Do you find that as the summer advances that vegetation disappears or increases?—That is the green weed which Mr. Harrison was speaking of yesterday. It acquires a full development and then disappears.

984. Where does it go?—It sinks down and goes away, and it becomes diminished in magnitude. All these water weeds are of very small body, and after

LONDON.

Mr. C. Greaves.

11 Dec. 1866.

they have ripened into full vegetation they seem to be gone until the next season.

985. Would not the deposit in those reservoirs be to a great extent sewage matter?—No, it would be weed, and clay and fine silica.

986. Did you ever clean out any of your reservoirs so as to ascertain that point?—It is mostly of a mineral character. The basins which we have been talking of as the covered basins were cleaned out thoroughly before they were covered. There was a great deal of mud in them then, but there was nothing particularly offensive in it. Of course, mud has always a bad name, and no doubt it had a certain amount of vegetable matter in it, but it was mostly fine clay and chalk and silica.

987. I think that you stated yesterday to the chairman that you could not tell exactly what volume of water the filter-beds would pass through them per square yard, or per hundred square yards, and that the quantity passing varied at different times according to the condition of the water?—According to the condition of the water and to the condition of the beds.

988. You said that sometimes the water in the filter-beds was very nearly level, and that at other times there was a considerable difference in level?—The more you choke the surface of the beds at times of course the more retentive they are, and the difference of level increases.

989. Do you find that at different periods of the year that difference is very marked?—Yes.

990. When do you find the filter-beds acting worst?—The two periods which give most trouble are, one due to excessive vegetation in the commencement of the summer, and the other due to an excessive deposit of clay in the winter. I cannot draw a comparison between the two.

991. Have you ever on any occasion such an obstruction arising from those causes as to prevent your filtering arrangements being carried out satisfactorily?—Never such as to prevent their being carried out, but certainly to prevent their being carried out satisfactorily. We have had to clean filter-beds on the Sunday, and to do things of that sort, but it never went to such an extent as to interrupt the filtering.

992. The water from the filter-beds passes covered into the tanks, both of the upper and of the lower pumping stations?—Yes.

993. So that evidently the water which you pump from those sources in each case would be identical?—Yes.

994. Are there any means of pumping water from the open reservoirs at the upper stations?—No.

995. There is no communication between your pumps and the upper reservoirs?—No communication.

996. Have you any wells from which you draw water at all?—We have a chalk bore which we have not yet put into use.

997. At the lower pumping engines have you any wells?—None at all.

998. Have you a communication with the closed tank, the one which is now stopped, the uncovered reservoir?—Yes.

999. In saying that your Waterworks Acts are properly carried out, is there any Government inspector, or any person authorized to look into the matter, and to to see that the conditions of the Acts are fulfilled?—None beyond what is on your table.

1000. You have obtained certain powers, and you have carried out those powers?—Yes, an inspection was made by order of the Board of Trade, and Mr. Austin, Mr. Ranger, and Mr. Dickens came down.

1001. That was a special case?—Yes, there is no continuous examination.

1002. In supplying the tenements in the district which you supply with water, what is the size of the tap from which the persons in each tenement can draw?—Half an inch for constant supply as a general practice, and three-quarters for daily supply.

1003. Have you observed what quantity of water per minute or per hour can be drawn from a three-quarter-inch tap under the pressure which you apply in different parts of your district?—I cannot give it to you in gallons, but it is a matter of common daily experience with the subordinate officers of the company. In all waterworks certain pipes are sufficient for the supply as required.

1004. What quantity of water would a pipe three-quarter-inch bore deliver at the highest and lowest point of your delivery, when the supply is intermittent?—I do not think that it could be given in any figure, because the length and position of the pipe are various; a three-quarter-inch pipe is ample.

1005. Supposing that it is pretty close to your main, what quantity of water per minute will a three-quarter-inch pipe deliver with the pressure which you maintain; I understand that you maintain a constant pressure?—We maintain a constant pressure, but the pressure and flow do not always match one another.

1006. Do you not think that it is a point of importance to you to know what quantity of water a three-quarter-inch pipe will deliver at any point?—It is difficult to know it with precision in the different cases which arise. We know that a three-quarter-inch pipe and a half-inch pipe are more than enough.

1007. Cannot you give any figures as to the discharge from a three-quarter-inch pipe in your district under the pressure which you apply?—I may have had them, but I have not them by me; they are not figures of any value so as for me to keep them.

1008. For what period in the day do you supply water to the tenements under the intermittent system?—The average is about 20 minutes.

1009. I observe that in these reports there are two districts mentioned, in one of which the period is 10 minutes, and in the other it is 15 minutes?—Yes.

1010. And complaints are made of the shortness of that time?—Yes.

1011. Complaints are made to the medical officers of the two districts?—Yes, that is one of the difficulties. There are hundreds and thousands of cases in which houses could get their supply in 10 minutes, but we are obliged to give it to longer than the 10 minutes, because they are not prepared to receive it.

1012. What notice is given to the people occupying these premises that the water is going to be turned on?—It is a uniform period every day.

1013. So that the people know exactly when the water is coming?—They ought to be prepared; there is no excuse for not knowing.

1014. As the time is so limited it is of great importance that the quantity of water which can be discharged in the time should be well known?—Quite so, but it is now practically known.

1015. May there not be some persons who are so engaged that they cannot afford to obtain a supply?—I have no doubt that there are cases in that position, but if the water company are to give way to case after case of that kind they may give up altogether.

1016. Have you any poor districts where the supply is constant?—Yes, very large districts.

1017. What amount do you find practically that they take per head per day in such districts?—I myself am not indisposed to a constant supply, and I believe that if a more arbitrary power could be given for carrying out a constant supply, and if that power was exercised, a constant supply would be no more distressing to the water company than an intermittent supply.

1018. What quantity do they actually take in a poor district where there is a constant supply?—It varies, I suppose, from 60 to 120 gallons per house per day.

1019. For how many people would that be?—Taking our district through, I believe that the population is about eight to a house.

1020. So that it would be from 10 to 15 gallons a head?—Yes.

1021. The poor would take considerably more than the rich?—I suppose not, because the way in which the greater quantity of the water goes is by the water-closet arrangement. One of our great difficulties throughout the poorer and inferior districts is the difficulty of having fittings in the houses competent to receive the water. We know that the proportion of houses having nothing better than an 18 gallon tub amounts to 20 or 25 per cent of the whole population.

1022. I asked you yesterday as to the number of pumps and wells in the district which you supply; you could not give me any exact information upon the subject, but I found last night that there were reports upon the subject to the Registrar-General, and among others, there is one from Dr. Letheby who reports that the districts in which he acts include the City, East London, and West London, and that there are 35 pumps in the city; and he gives the quantity of organic matter, which is very much larger than either that from your company or from the New River Company?—Yes; those are public pumps I imagine, which had been erected as charitable erections in former years, and they stand by cab stands and kerbs of the pavement.

1023. He says that in most cases the constituents are remarkably indicative of the source and nature of the pollution, he seems to say that they are very polluted?—None of the old sewers were made with tight bottoms, and therefore the pumps and other things must draw water which is polluted.

1024. Besides Dr. Letheby's reports there are the reports of the Registrar-General in August and September 1866, which mention the number of pumps and wells. There is a report from Dr. Adams, the medical officer of health for Shoreditch; he says, "I have long "taken pains to suppress pumps and wells, and I "believe that the company's water is now almost ex-"clusively used." Dr. Liddle the medical officer of the board of health for Whitechapel, states, "I have had no "experience as to the effects upon health from pump "water, but the water from many of the pumps "recently became so foul that it was deemed advisable "to prevent the further use of them"?—Yes; we have had that information from time to time.

1025. Mr. Orton, the medical officer of Limehouse, states, "There are no public wells in use;" Dr. Woodforde, of Bow, says, "We have neither pumps, wells, "nor springs in use for the supply of drinking water." The medical officer of Poplar states, "There are not "any pumps or wells in my district"?—That I suppose means public pumps.

1026. There would not appear to be any great number of pumps or wells within the district, and those which there are appear to be very bad?—Yes.

1027. Do you know the quantity of water which is daily taken by the five water companies from the river Thames?—It is stated in the monthly reports.

1028. It is 48,375,000 gallons, and the two water companies take from the Lee about 43,300,000 gallons?—Yes.

1029. So that from the river Lee you take very nearly as much as is taken from the Thames?—Yes.

1030. The area of the Thames above the point of water supply is how many square miles?—I should think about 3,500.

1031. And the area of the Lee above your water supply is what?—It is about 450 or rather more; it is not more, taking into consideration the excluded district.

1032. So that the volume in your case is taken from a much less total area, although your take is nearly as much as a whole?—Yes.

1033. Can you state the volume of water taken from the Lee in 1850 by the New River Company and by the East London Company, as compared with what it is now in 1866?—I do not think that I can state the New River quantity in 1850; the East London quantity was about 11,000,000 gallons a day.

1034. And at present it is what?—Nearly 20,000,000 gallons.

1035. I believe that in 1850 the New River Company had 12,000,000 gallons from the river, and now take about 16,000,000 gallons directly from the river?—Yes; and all that they took from springs would have gone into the river.

1036. So that the amount taken direct from the river was in 1850, 22,000,000 gallons; and is now about 37,000,000 gallons?—Yes, altogether.

1037. Have you an intimate knowledge of the district of Poplar and that neighbourhood?—I think so; I am well acquainted with the whole district.

1038. Were you acquainted with the condition of the sewerage of that district from the commencement of this year and until Midsummer?—There is no doubt that the sewerage of that district was in a very imperfect condition.

1039. Was the lower level sewer of the metropolitan drainage being carried out through that district?—Yes.

1040. It was not completed?—It is not completed yet.

1041. Was the sewerage of that low-lying district up to a recent period improved as compared with former years?—Quite unimproved, and in fact I should think that it would be a very fair thing to say that it was very much deteriorated, because by the discharge which was taking place into the river Lee and passing down the river Lee by various channels, the atmosphere was tainted more than independently of that nuisance it would be. There is no doubt that that was an imported nuisance, it was brought down to that low-lying district.

1042. The sewer which has lately been formed through the district is part of the low level sewer?—Yes.

1043. (*Professor Way.*) Nothing has been discharged into that sewer from the upper district of London, has there?—We do not precisely know what has been done, but it is quite evident that more sewage has been turned into the Lee than would be turned into it in a natural way.

1044. Was that in overflow times when the mid-level and the low-level sewer were made?—It was not only in overflow times but at other times.

1045. The low-level sewer has not been made through London?—No.

1046. (*Mr. Harrison.*) Do you know that more sewage was brought down to this district on account of the partial completion of that low-level sewer than was due to the district itself?—I should say so.

1047. Has it had any influence in the Limehouse cut and that part of the river Lee?—It has had a decidedly damaging influence.

1048. At present a pumping engine is placed at the terminus and the sewage is being pumped into the high-level sewer?—A certain quantity of it.

1049. Is there anything which you wish to add?—I think not.

The witness withdrew.

LONDON.

Mr. J. Muir.

11 Dec. 1866.

Mr. James Muir (London) examined.

1050. (*Mr. Harrison.*) I believe that you are the engineer to the New River Company?—I am.

1051. That is one of the oldest established companies in existence?—It is.

1052. Whence does it derive its water supply?—It derives its water supply from the river Lee at a point between Hertford and Ware, and also from the Chadwell spring.

1053. Was the Chadwell spring its original source of supply?—It was.

1054. What volume of water does it deliver?—A varying volume, but the average is 400 cubic feet a minute.

1055. That would be 3,600,000 gallons a day?—Yes. Some gaugings which were made at the beginning of this year showed it to be very nearly 700 cubic feet a minute.

1056. That is 6,300,000 gallons a day?—Yes.

1057. What is the minimum flow which you have ever recorded?—The minimum which I have gauged is about 290 cubic feet a minute; that is a very rare occurrence indeed.

1058. When did you record the minimum?—I think that the minimum may be taken as having occurred in the year 1864.

1059. Was the quantity then less than in September 1865?—I think so, but I did not gauge it in September 1865; there was not the same reason for gauging then.

1060. You have not kept a periodical gauge at any time?—I have not.

1061. You also take water from the river Lee?—Yes.

1062. That is under an Act of Parliament?—Under an Act of Parliament, under which a quantity is now taken from the river Lee; it is the River Lee Act of 1855.

1063. What volume of water are you empowered by that Act to take daily?—It is stated in the Act to be 2,500 cubic feet a minute, and that is about 22,500,000 gallons a day.

1064. Do you take a volume to that extent?—No. Up to this day of this year I think that we have taken 18,000,000 gallons and a little over on an average.

1065. We understood Mr. Beardmore to say that that river is derived almost entirely from chalk spring water?—Yes; the drainage district is almost entirely chalk, and the water which it yields may be called spring water.

1066. Do you know the volume which passes down the river at the point at which you abstract the water?—I can only know it approximately by knowing what has been drawn through our own gauge, and by taking into account what the navigation may have used, and what may have been used by the mill in the immediate neighbourhood of us.

1067. And what is that?—I cannot give the average, but I think that the minimum is something rather less than 3,000 cubic feet a minute.

1068. That would be about 27,000,000 gallons a day?—Yes.

1069. What is the population within the drainage area above the point from which you take your supply?—The populations of Hertford and Luton amount to about 22,000; the population of Luton, from the census returns is, 15,329, and of Hertford 6,769.

1070. Are there any other large towns besides those two?—No.

1071. Are there villages to any extent?—Not to any great extent. I think that the most populous villages are on the river Rib and its tributary, the Quin; and I think that the population of that valley may be taken as about 7,187. These populations are taken at principal places on the tributaries. The population on the Lee, omitting Luton and Hertford, is 3,431; on the Mimram it is 2,212, and on the Beane it is 1,687.

1072. Making a total population above the point of supply of how many?—36,600, including Hertford, the drainage of which is carried below the Company's intake.

1073. You have not included Hatfield in that?—No, there is no direct drainage into the Lee from Hatfield, and in regard to Hertford and Luton I have kept them apart because they are dealt with by sewage works; the population not dealt with by sewage works is 14,500.

1074. Has Luton carried out a system of purification, or of irrigation?—Of purification.

1075. After the purification does the effluent water pass into the Lee?—It does.

1076. Have you had it examined as to its condition?—I have.

1077. What is its condition?—On some occasions its condition may be described as tolerably good; on other occasions complaints have been made at the instigation of the New River Company, some years ago. These complaints were brought before the Board of Health. The first complaints made issued in the town authorities carrying on this work of deodorization, and when the complaint was afterwards renewed they added to their works, and since the addition there has been no ground of complaint.

1078. As to the sewage of Hertford, have you yourselves taken steps to remove the sewage to a point below that at which you abstract your supply?—We have.

1079. And have you taken steps to deodorize that water before it passes into the river?—Yes.

1080. What are those steps?—They are described in the Hertford Sewage Act of 1854, in which it is enacted that the sewage after being collected shall be dealt with by Higgs's process, namely, precipitation by lime.

1081. (*Professor Way.*) The same as at Tottenham?—Yes.

1082. (*Mr. Harrison.*) Does the effluent water after that process pass in a pure state?—Yes, in a tolerably clear state. It is white from the application of the lime, and it is passed at a point below that at which the New River Company obtain their supply.

1083. Have you had that effluent water analyzed?—Yes. The sewage itself as it comes to the works is in a very diluted condition.

1084. Is that in consequence of the large introduction of spring water into the sewer?—Yes; the whole amount of suspended matter in the sewage is only about 6 grains and $\frac{3}{10}$ths per gallon.

1085. And what is the condition of the effluent water?—I cannot give that from the note which I have here. I must consult other memoranda.

1086. Perhaps you will give us an analysis of the water?—I will do so. (*The witness subsequently furnished copy of analysis, and it will be found printed at the end of his evidence, Appendix No.* 1.)

1087. Besides those two sources of supply, do you derive water from wells?—Yes.

1088. Where are they situated?—There is one well at Ware which has not been used for many years.

1089. Why did you cease using the water at that point?—One reason was that it was not required, and another reason was that it was supposed to affect wells in the town of Ware—wells in the gravel. Means have been taken to prevent that, and a bore is being carried down into the chalk so that it may not affect any portion of the town of Ware.

1090. To what depth have you sunk?—About 300 feet.

1091. Did you find water throughout the whole of that depth?—Yes, but all the gravel water is now shut out, it is cylindered to a considerable distance into the chalk.

1092. What is the diameter of your bore?—The well has a diameter of 7 feet at the top, reduced to 6 feet 6 in the lower cylinder. The bore is 2 feet in diameter.

1093. Do you know what supply that will give you?—About 2,500,000 gallons a day.

1094. What volume used you to draw from the wells before?—It is so long since we worked that well that I do not know what quantity it yielded. There is a second well at Amwell hill.

1095. Do you take water from it now?—Very occasionally.

1096. With what volume will that supply you?—2,458,876 gallons in 24 hours.

1097. You do not take it because it is not required?—Yes; it is merely a means to fall back upon.

1098. What are the other wells from which you obtain water?—There is a well at Chesthunt capable of yielding 699,972 gallons in the course of the day. There is another well at Hoddesdon, not yet finished, but I suppose that it will yield about 2,500,000 gallons a day from the experience of pumping which we have already had.

1099. Your experience is that the water passes into your sewer pretty freely; do you find that by pumping water in large quantities from those wells you get it at all contaminated by sewage matter?—Not at all.

1100. Is that from the depth?—Yes, and the distance. The water which enters the sewers is entirely water from the gravel.

1101. Do you now use any subsiding reservoirs and filters?—Yes, our subsiding reservoirs are in Stoke Newington.

1102. Of what extent are they?—Of about 40 acres.

1103. When were they constructed?—About 1832.

1104. Have you any filters adjoining them?—Yes.

1105. How long have they been in operation?—Since 1856.

1106. Have you had occasion at any time to clean out the subsiding reservoirs?—They were cleaned out about 10 years ago.

1107. How long was it previous to that that they were cleaned out?—I believe not from the time of their construction.

1108. How many years would that be?—From 1832.

1109. What depth of deposit did you find after that long period of subsidence?—I was not engineer-in-chief then, but Mr. Mylne was, and I have heard him say that it consisted chiefly of mineral matter, clay which had been brought down by the stream and deposited there.

1110. What was the depth of it?—It varied.

1111. Can you state the average?—I forget it. I should add that there are also subsiding reservoirs at Hornsey, and filtering beds in connexion with them.

1112. What is the extent of those filtering beds?—Two acres at Hornsey, 5 acres at Stoke Newington, and $2\frac{1}{4}$ acres at the New River head.

1113. Are those the whole of the reservoirs?—Those are all the filtering beds which we have, excepting what are in course of construction, and those will add 2 acres to the area which I have given.

1114. Have you large impounding reservoirs?—No, not in addition. We have the subsiding reservoirs, which I have described, 40 acres at Stoke Newington and about 8 acres at Hornsey.

1115. What volume of water will those two sets of reservoirs hold?—I do not know that I can give that off-hand. The depth is very varying, but I think about 15 feet is the average depth in one of the Stoke Newington reservoirs and about 12 feet in another, and the area is 40 acres.

1116. How many days' supply will they afford to the district which you supply with water?—If they were pumped, which we have not the means of doing, they would afford a supply for 10 days or a fortnight, but we use them only for the purpose of subsiding; they are drawn down for a few feet and then are filled again.

1117. Will you describe your filter beds?—They are made in the usual way with brick sides and a brick bottom, and covered with coarse gravel, a finer gravel thereon, and then from 2 to 3 feet of fine sand on the surface.

1118. What quantity of water per 100 square yards will those filters pass through per day?—By pumping hard in the wells, so as to reduce the level of the water much below the level in the bed, a very large volume can be got through, but it is a bad treatment of the bed; a proper pressure will deliver between 600 and 700 gallons per square yard in the course of the 24 hours. To deliver the requisite quantity two-thirds of our area would suffice.

1119. Do you find much deposit from your filter beds?—Not a great deal; the deposit is chiefly after heavy rains. Nothing is so troublesome as the growth of weed under a bright hot sun; that weed falls down upon the sand and stops it up; the bed is then run off and the surface scraped.

1120. Mr. Beardmore mentioned that the rivers from which you are supplied are very little subject to floods?—Very little indeed.

1121. So that there would not be much surface abrasion carried down?—Comparatively little. In comparing the amount of filtering area which the East London Company provide and the amount of filtering area which we find sufficient, I attribute the difference very much to that cause, namely, that we are not so much affected by flood or mud being brought into our beds as they are.

1122. They have a much larger area in proportion to the amount which they deliver than you have?—Yes, much larger. I am now constructing beds, making an additional area of two acres.

1123. (*Chairman.*) Would you think that a filter bed was being distressed if it filtered one gallon per square inch in the 24 hours?—That would represent a very high pressure. A great deal would depend upon the coarseness or fineness of the sand; coarse sand will allow filtration to take place rapidly, but it will not be nearly so effective.

1124. That would be about 1,326 gallons per square yard instead of 600?—Yes, that is just about double what I mentioned as the proper thing.

1125. In your filtering beds have you any animal charcoal?—No; that has been the subject of a good deal of anxious consideration, especially since the hint was thrown out last summer by Dr. Frankland that the company should proceed at once to use animal charcoal. I procured animal charcoal, sold at 15*l.* a ton, and I experimented with it, but I found the thing not immediately applicable whatever might be afterwards done with it; that was as bone black.

1126. In what form would the charcoal be as bone black?—Very much as ordinary charcoal.

1127. Do you think that that is not a case which Dr. Frankland ever contemplated?—I do not know; he spoke of it as bone black. I took his directions; I took what he recommended.

1128. (*Professor Way.*) It is the same as the sugar bakers would use?—Yes.

1129. (*Chairman.*) Have you made any experiments with it?—I made some small experiment at the time, but the result was not very satisfactory. I filtered through it without having any sand superimposed, and the rate of filtration was 41 times greater than that which we find a proper and suitable rate of filtration with sand.

1130. Do you not think that in the construction of the filter the best arrangement would be to let it come below the sand, and not to be influenced by the sand?—Precisely. I only made this experiment because we had filtering boxes recommended. I found that they could not be arranged for, and that that exceedingly rapid filtration was worse than useless. The material sold at 15*l.* a ton was so impure that I found that it added to the impurities of the water.

1131. (*Professor Way.*) That would be the failure of an attempt under pressure of time and circumstances?—Yes.

1132. Therefore that does not settle the matter definitely?—No. There is no doubt that animal charcoal is one of the best of purifiers, and would be effective if placed under sand, say 6 inches in thickness; but the cost of it would be very great; there is the removal of the sand, the putting down of 6 inches of charcoal,

LONDON.

Mr. J. Muir.

11 Dec. 1866.

and the replacing the sand removed. I find that the cost to the New River Company would be about 94,000*l.*

1133. You have assumed a certain thickness of the charcoal over your filters?—Yes, under the sand; 6 inches.

1134. One element of the calculation would be the time that this charcoal would act?—Yes, it would become inert and would require to be taken out and reburnt.

1135. Is it a question of days or months, so far as you know?—We have not experience enough for me to say. We are now making inquiries upon that very subject. Dr. Frankland threw out a suggestion that it might last three or six months; six is his maximum period, and the expense of it would be a thing recurring every six months, and of course, enormous. As the water requiring to be purified is a very small amount of the company's supply we are in a difficulty. The water supplied for waterclosets and so on would have to be passed through the same expensive process.

1136. Still you have not by any means negatived the possibility of it?—No.

1137. And you think that it would be desirable to bear it in mind as a means of purification?—Yes.

1138. You are quite aware that the sand-filters, if they do anything in purifying the liquid water from the solid suspended matters, do not perform that process as as you would wish it to be performed?—If it is carefully conducted I think that the sand process takes out the whole of the suspended matter, but of course there are matters in chemical combination which it takes out imperfectly.

1139. Therefore it is highly desirable that an improvement should take place in the purification of water?—There is no great complaint to be made of organic impurity in the New River Company's supply. We have had two analyses every month, made specially by Dr. Letheby. It would seem to me that the average is hardly four-tenths of a grain of organic matter per gallon.

1140. You are aware that the analyses which have been made of waters of late years have gradually reduced the quantity of organic matter by greater manipulation?—Yes, I believe that there are some analyses, for instance, Dr. Frankland's, in which, are enumerated under the head of organic matter, things which are not actually organic matter. I think that there is a difference between his analyses and Dr. Letheby's on that account.

1141. You, I believe, claim that New River water is as pure or purer than the water from any other source in the district?—It comes from a chalk district, described to you to-day as supplying almost all spring water and we pour into it a very large volume of pure spring water, and the analyses of Dr. Frankland shows that the New River water is the purest water, so far as organic matter is concerned.

1142. (*Mr. Harrison.*) Is there much tendency to growth in the tributaries above the point where you derive your supply?—Yes, there are weeds, and I should rather call them beneficial than otherwise.

1143. Are they beneficial when they decay in the autumn?—No, not when they decay.

1144. Do you find a difference in the analysis of the water then as compared with other times?—The first difference in this year took place this month from the heavy rains.

1145. Bringing down decayed vegetable matter?—And mineral matter also.

1146. (*Professor Way.*) Do you know of any supply of water to London which would not be mixed more or less with hard water?—No, unless in the case of the supply from the Bagshot sands, which was proposed some years ago.

1147. That might be sufficient for drinking purposes?—Yes.

1148. Do you know the supply of water in Glasgow?—Yes.

1149. Should you prefer water in its ordinary state, as supplied to Glasgow, to the water of the New River?—I think not. I think that the water as supplied to London is a more tempting water as a beverage than the very soft water of Loch Katrine. There is no doubt that Loch Katrine water is pleasant for washing from its excessive softness, but I think that there are decided advantages in a water not so soft for drinking.

1150. I suppose that the quantity of water used for drinking purposes is extremely small as compared with the quantity of water used for washing purposes?—Yes.

1151. Do you not think that some advantage might be gained if you could get a water for drinking purpurposes less hard than the water of the Thames or the Lee, but still not so soft as the water of Loch Katrine?—I think that the hardness of the London water—namely, the Thames, the Lee, and the New River is very much reduced by boiling, and that it therefore cannot leave a great deal to be desired, and that the result said to attend the use of softer water is rather astonishing. The complaints which have been made as to the use of the harder water proceed to some extent upon a fallacy.

1152. Is all the water which is used for washing boiled?—No.

1153. Is a large proportion of it boiled; in scrubbing you cannot put your hands into boiling water?—No; the quantity of soap destroyed in washing will not be measured by the quantity of water in the basin in which you wash. Take a basin of cold water; the hands are washed. The quantity of water in that basin will not measure the quantity of soap destroyed by the process.

1154. Do not you think that that arises from the fact that it is hard water? You wash out of the basin when you have hard water and you wash in the basin when you have soft water?—A good deal is used merely to remove the lather which you have made.

1155. A soft water uses less soap than a hard water?—Yes, but the estimate made of the quantity of soap destroyed by the quantity of water used would be a fallacious one.

1156. Do you know Dr. Clarke's process for softening water?—Yes.

1157. Have you seen it tried on a large scale?—No.

1158. Have you seen it tried on an experimental scale?—Yes.

1159. I suppose you are aware that he can satisfactorily soften the Thames water from 14 or 15 degrees of hardness to three or four degrees?—Yes.

1160. Do you know that that process has been tried upon a very considerable body of water, and is in use at this moment?—I believe that it has, and I believe that a difficulty has been found in working with it, chiefly arising from the deposit in the pipes which convey this softened water. I believe that it is not merely the mechanical deposit of the fine chalk which the process throws off, but that crystalization takes place.

1161. Is it in use at North Woolwich?—It was, but I believe that it has been discontinued.

1162. What you describe would arise from the remains of the carbonate of lime, which had not gone out of solution?—I suppose so.

1163. Has the question of softening the water by Dr. Clarke's process come at all under the attention of your board?—It has been matter of conversation, but it has never been very distinctly before them, so as to be a subject of resolution.

1164. Can we ascertain the fact that the water does choke the pipes?—I understood that that was one of the difficulties in its use at Plumstead, but I have not seen it.

1165. Do you think that it is barely possible that the use of the lime process might do away with the necessity of filtration?—To a great extent, no doubt, it would be so.

1166. Where lime is used in the case of the sewage

at Hertford it saves the necessity of filtration?—A. Hertford the precipitation is followed up by filtration.

1167. You say that Mr. Higgs' process is carried out at Hertford?—Yes.

1168. He had the process at Tottenham?—Yes.

1169. Is that process continued still?—No, it is discontinued.

(*Mr. Beardmore.*) It is nine years since it was used.

1170. (*To Mr. Muir.*) Was there any difference in that process from the one which was usually known as the lime process?—I think not. The patent, of which we bought from Mr. Higgs the right of using, was simply for precipitation by lime. I found it necessary to add chloride of lime, which had a powerful effect in stopping vegetation.

1171. You know that the lime process has been used in many places without success?—It has.

1172. And that even where it has been most successful, and has had the most chance of success, such as at Leicester, where the tanks were made to stop the valuable material, and not merely to clarify the water, but to produce a satisfactory result, they are giving it up?—It is not a commercial success, but it is as good a process of deodorizing as we can well use.

1173. Short of application to the land?—Yes. This particular process is prescribed in the company's Act as the one which they are to use, or (it is added) the one considered best, and we must wait to know what is the best process in order to apply it.

1174. Have you had at all under consideration the application of sewage to land?—It has crossed my mind, but the directors have not taken up the matter. I consulted Dr. Letheby not very long ago as to the application of the sewage of Hertford, and he thought that we could not do better than carry on the lime precipitation. Dr. Letheby said that we could not do better than increase the quantity of lime which Mr. Higgs prescribed, and I make it now, I think, three times what Mr. Higgs in the first instance prescribed.

1175. (*Chairman.*) Have you any means by which you could test Dr. Clark's lime process upon any considerable volume of your water without putting you to large expense?—I think that it must be attended with considerable expense if applied to any of our reservoirs.

1176. I mean any temporary reservoir, such as 2,000 or 3,000 gallons?—That would be a matter easily done.

1177. You could make a small tank and lime it with a due proportion of caustic lime, and make the experiment yourself?—Quite well.

1178. And you could try it upon different characters of water; upon the water when it was turbid, and upon the water when it was at the brightest?—Quite well.

1179. (*Professor Way.*) Mr. Simpson, some years ago, made an experiment at the Chelsea waterworks on 1,000,000 gallons in one quantity?—Yes.

1180. The experiment was very beautiful and very successful?—Yes. The difficulty in practice is giving time for the settling of the very fine impalpable chalk.

1181. Suppose that it could be shown that that process would dispense with filtration?—Then I am told that there would be a deposit in the pipes.

1182. (*Chairman.*) What volume of water per day have your company at command for supply to customers?—I think that we have now at command, including the various wells which we fall back upon if there is necessity, some 35,000,000 gallons per day.

1183. What number of customers do you supply in your district?—We have now more than 112,000 houses supplied.

1184. Then you are supplying by far the larger portion of the metropolis as compared with any other company?—Yes.

1185. What volume are you now giving to those 112,000 houses?—I think this month about 22,500,000 gallons per day.

1186. Have you any idea how many of those houses have waterclosets?—A great proportion.

1187. Nearly the whole of them?—Yes, excepting the very poorest places. There may be courts without separate waterclosets.

1188. Is your district an essentially watercloset district?—Yes.

1189. What is the population?—It is nearly $7\frac{1}{2}$ per house.

1190. I think that the average for the whole of the metropolis is $8\frac{1}{2}$ per house?—I thought that it was hardly so high.

1191. Yours is you think $7\frac{1}{2}$?—Yes.

1192. What volume are you supplying for trade purposes?—It is difficult to say, because many trades are carried on in a small way in connexion with domestic consumption.

1193. When you supply for trade purposes do you supply by bargain or by meter?—In a great many cases by meter.

1194. What meter do you use?—Siemens's meter is the most convenient. I do not say that it is the most accurate, but it is very easily placed, and the customers do not object to it. They always object to a more accurate piston meter from its great bulk.

1195. Do you think that Siemens's meter is as fair to you as to the customer?—No.

1196. Would not Siemens's meter, if the supply was intermittent, register rather against the consumer than against the supplier?—I think not; but almost all our mains have constant supply where a meter is furnished.

1197. Have you any idea how many meters there are on that system?—There are 720 meters in use in the New River Company's district.

1198. You can also give about the average consumption?—Yes. Those meters together measure about 2,300,000 gallons a day on an average.

1199. What is the price?—It varies according to the scale of the Act of Parliament of 1852.

1200. Your Act of 1852 gives the scale?—Yes.

1201. Do you charge the maximum amount allowed in that scale?—Yes.

1202. Do you make any allowances?—We do in some cases.

1203. How many fire hydrants have you upon your services?—There have been some recently placed upon the mains in Cheapside for the purpose of washing the surface, but, generally speaking, all the fire supply is through the old plug. The cost of a plug, or the cost of a hydrant is a thing which by law should fall upon the parish. We have not required the comparatively inexpensive plug to be found by the parish, but we have found it ourselves, but the more expensive hydrant, costing 6*l.* or 7*l.*, the parishes or Metropolitan Board of Works must find.

1204. Is the water supply for fire gratuitous so far as you are concerned?—Quite.

1205. Do you supply any water gratuitously for baths, or hospitals, or fountains?—At reduced rates baths have been supplied, and practically you may say that there has been a cheaper supply to hospitals, though not nominally, for the full rent is put down, and the company make a donation.

1206. Do you supply any water by agreement or by meter, for ornamental purposes, in your district for fountains or for garden purposes?—Yes. We rather object to provide fountain supplies to parks and houses where the water may go to waste.

1207. You discourage it?—Yes.

1208. Would you discourage it if the supply was by meter?—We should not have the same objection then.

1209. Is a portion of the supply of your district intermittent?—Yes.

1210. What number out of the 112,000 houses which are supplied would be upon the constant system, and what number upon the intermittent one?—I think that only about 1,200 or 1,300 are now on a

LONDON.

Mr. J. Muir.

11 Dec. 1866.

constant supply, and all the rest are on an intermittent supply.

1211. Is the intermittent supply on each day or on alternate days, or in what way?—Every house has a supply every working day in the week, and some of the houses have a Sunday supply.

1212. What is that supply?—It varies; but the rule is, that the supply in every case is to be left on by the turncock so as to fill the cistern, whatever it may be.

1213. In all cases are there cisterns or tubs for the intermittent supply to the poorer class of tenants?—In some of the poorest houses they have no tubs supplied by the landlords.

1214. Then if they miss the supply by being out, or anything of that sort, they miss the supply for that day?—Yes, or get it from some other place.

1215. Have you any byelaw which would enable you to prosecute a person for taking water otherwise than from the company's supply?—Yes.

1216. You would apply the term stealing to taking water without arrangement, or without paying for it?—Yes; that clause, I believe, is in the General Water-works Clauses Act.

1217. Have you any estimate as to what volume is supplied to those poor tenants, or is it merely haphazard?—We cannot separate that supply.

1218. (*Mr. Harrison.*) You have said that you keep it on in the different parts of your district a sufficient length of time to afford the requisite supply to each tenement?—Yes; in every case, it is found out what time is requisite to supply the cisterns in all the houses.

1219. What quantity will those cisterns hold?—It varies. One house in a street may have a large cistern, and the water is left on long enough to supply that cistern, and all the other houses get the benefit of it, whether they have such cisterns or not.

1220. Then the largest sized cistern governs the supply for the whole district?—Yes, if it is of a reasonable size.

1221. What should you call a reasonable size for the whole district?—From experiments which I made some years ago in model lodging-houses I found that their actual requirements, allowing them to take as much as they required, did not amount to more than seven gallons per head per day, but rather less; a great deal more than that is allowed them.

1222. (*Chairman.*) I presume that you are not responsible for the private arrangements and storage for domestic and other purposes in the case of the poor tenants?—Not in the least.

1223. Is it or is it not a fact within your knowledge that those arrangements in many instances are of a very wretched character?—Very.

1224. And that consequently, without casting any stigma upon your company, the supply may bear the title of being wretched and inefficient?—Quite so.

1225. Would you consider that before London, in its poorer districts, can be said to be supplied with water some imperative regulation should be brought into force to compel the owners of that property to make sufficient arrangements to receive the water which you are ready and willing to give?—There is no question of it. The company have done all they can to urge the thing upon the landlords; they have driven pipes to the doors of the houses where the supply was wanted, and yet in some cases the landlord will not go to any expense in making provision for laying on the water.

1226. Have you a difficulty in collecting the rates from that class of property?—I think not.

1227. Do you know whether you make many bad debts?—I think not.

1228. But I suppose that you would not wish to lead this Commission to believe that, although you are prepared to give and can give an abundant supply; London in its poorer parts is abundantly and well supplied with water?—It is not, but through no fault of the company.

1229. Therefore if there are complaints very loud, and very angry, there is some ground for them?—Yes.

1230. And it is necessary before London can be considered to be properly supplied that some additional regulations should be put in force for receiving, storing, and economising the water which you are prepared to give to every customer who applies to you?—It is most necessary.

1231. Supposing that under the present wretched arrangements your supply were to be constant in the 24 hours, what would be the consequences to you?—With present arrangements the thing would be impossible. I do not say that if all the arrangements in the houses were made as they ought to be, to receive a constant supply, we could not accomplish what is said to be accomplished elsewhere, namely, a reduction of the consumption to something like 15 gallons a head; that would be a boon to us and the public, but the preparation for such a supply would throw such an enormous expense upon the landlords that I do not think that they would make it.

1232. Do you think that it would really and truly be a large cost to the landlords to arrange for a proper supply; do you know what would be the cost of a three-eighths pipe per yard, and a three-eighths service cock, which would be quite sufficient upon the constant system for any single cottage-house in this metropolis?—Yes, with cottage property I think that there would be less difficulty.

1233. A half-inch pipe and a three-eighths tap, or a quater of an inch tap, according to the pressure, would be quite enough?—I do not think that the difficulty would arise so much with respect to cottage property so supplied if you could compel the landlords to do it; the expense must be trifling, but I still hesitate about leaving that class of property without the means of storing water at all on those occasions when mains have to be shut off for repair.

1234. Supposing that a service tank were made for a court which could be made of good cast-iron or wrought-iron, to contain 1,000 gallons, the cost would not be a very large one?—I have recommended it again and again, but landlords will not adopt it.

1235. You could arrange it by having an air valve on the top so as to prevent the water from wasting, and you could fill it every day, and each person could draw from it within his own house?—Yes, we are perfectly ready to supply under that arrangement, but landlords in most cases which I have tried will not adopt it.

1236. Are there many complaints made to you of defective supplies?—No, very few.

1237. Have you a complaint book at your office?—Yes.

1238. Would you object to let the Commission see that complaint book?—Not at all.

1239. What is the largest main which you have in your service?—We have 48-inch mains in connexion with the river supply. The largest pumping mains which we have under heavier pressure are 36 inches.

1240. What are the largest service mains in the city proper?—They range from 36 inches down to 3 inches.

1241. Do you know at what date your company began to use cast-iron, because I assume that the New River Company was established at a time when cast-iron had not been brought into use for services?—All their pipes originally were wood.

1242. How were the joints made?—The end of one pipe was sharpened and driven into the end of the other pipe, which was slightly widened.

1243. Was it luted with white lead?—I think not.

1244. Was there a wrought-iron strap?—I have sometimes seen a wrought-iron hoop to prevent the wood from being split.

1245. When did you begin to supersede the old wooden services?—I can give that date, but not from recollection.

1246. Were the first pipes flange pipes?—A number of them were.

1247. Are there any flange pipes in use now?—No, all the flange pipes have been taken up in consequence of the trouble which they gave from leakage by the contraction and expansion.

1248. What kind of joints have you now?—An ordinary socket run with lead.

1249. What form of socket do you generally adopt?—About 4½ inches in depth.

1250. What depth of lead would you give for the 4½?—Nearly the whole depth according to the plan adopted now; a ring of cold lead with molten lead run on it, so that the joint is made solid.

1251. You give the first caulking with cold lead, and the outer caulking with hot lead?—Yes.

1252. And you find that the best form?—Yes.

1253. Have you ever examined an old joint to see what has been the action of it?—I have examined many of them.

1254. Have you ever examined one under a microscope?—No.

1255. Are any of your mains laid so near the surface that the frost has at any time affected them?—I have known cases in the outlying districts where a small iron pipe has been frozen.

1256. How near would the top of the pipe be to the surface?—Probably 2 feet; the depth which is now always prescribed is 2 feet 6 inches from the top of the pipe to the surface of the road.

1257. Have you any prescribed distance at which you keep your water mains from gas mains?—There is a prescribed distance as regards the gas mains; they are required to be kept 4 feet from water mains, but that distance in the streets of London cannot always be kept.

1258. Are any of your mains interlaced with the gas mains?—Yes, in some of the more crowded places.

1259. Have you ever found inconvenience from the back draught of gas into your mains?—That has been an occasional accident, but only occasional.

1260. What do you consider the life of one of your cast-iron pipes?—Some of the very oldest I have found as good as on the day when they were laid.

1261. What number of years had they been in?—I should think 60 years.

1262. And they were sound then?—Quite sound.

1263. Do you varnish your pipes by Dr. Angus Smith's process?—I have tried it as matter of experiment, though it is hardly needful, inasmuch as all the pipes through which the New River passes become coated with the finest possible coating of lime which does not increase.

1264. It combines with the oxide of the iron and forms an enamel?—Yes.

1265. Do you cleanse and limewash your pipes before putting them down?—Yes, we hot lime them throughout.

1266. What are your service pipes made of?—The tenants communication pipes are almost all of lead; we recommend lead.

1267. Have you ever tried wrought-iron?—Yes, but it does not answer; corrosion takes place. I have known a wrought-iron pipe only last five years.

1268. Is the corrosion external or internal?—Apparently both.

1269. Has your water in any case to your knowledge any action upon lead?—Not the least.

1270. Neither in the cistern nor in the pipe?—Not the least.

1271. Have you many dead ends upon your service?—Yes.

1272. Have you any means of cleansing the water from the dead ends?—Yes, in all of them there are plugs on purpose.

1273. Have you an accurate plan of all your mains and services?—Yes, laid down upon the ordnance plan.

1274. So that if you wish to interfere with any section of your mains you can shut down your valves and isolate?—Yes.

1275. Have you much leakage upon your system?—I think not; because from very careful inspection, if leakage occurs, it is immediately discovered, if there is any leakage on the surface of course it is seen, and we have a periodical examination of the sewers, and by that means we some years ago managed to check a great deal of leakage. If you look at the tables of consumption returned from time to time by the New River Company you will find that our consumption has not very much increased, and that it is rather less now than it was some years ago, and it is entirely due to the stopping of leakage and waste.

1276. Your present mode of discovering leakage would be that when it comes to daylight you can see it, and if you have any suspicion of it you gauge the sewers?—Yes; it is not so much by gauging as by the men who enter the sewers, seeing where the leakage occurs and reporting it; and by paying them a small reward we have no difficulty in that respect.

1277. I think that the workmen themselves have a ruder method of trying whether a valve leaks by holding a bar to the ear?—Yes.

1278. What is the largest sluice valve which you use?—It depends upon the size of the pipe.

1279. Have you any arrangement for easing the friction of the larger valve?—No; a 36-inch valve is the largest under pressure, and we have had no difficulty in that case.

1280. To what height will the water rise from a fire-plug in the best portion of your district, that is to say, where the water would rise the highest and the freest?—The pressure in the mains is a very varying thing. I have seen the water go freely 70 feet, and in certain places it may be got higher.

1281. At points, such as that the intervention of a fire-engine would not be requisite?—It would not.

1282. That is not the condition of things over the whole of your services?—No.

1283. There are districts I daresay where you could not get 6 feet from the surface?—I should say none.

1284. In Victoria Street, where we are now sitting, there is a pressure of 150 or 200 feet, but I will guarantee that you could not get 3 feet from the surface?—Then it must be a very small main. If the water is not brought up by a proper jet pipe or nozzle in all probability you will not get it to rise a sufficient height, but if you have a proper jet pipe from which it can issue it will rise for some great distance.

1285. It must necessarily depend upon the length of the main and the distance which it is from the head, and the junctions which it has to pass, and the draught upon it?—Yes and the size of the main.

1286. And the number of branches?—Yes.

1287. In fact there are innumerable conditions to be taken into account?—Yes.

1288. Of what length is the New River in its entire length?—It is now about 28 miles.

1289. What is its cross section?—An average of 75 square feet.

1290. What is its fall per mile?—Its fall is from 99 feet to 82 feet in the whole distance.

1291. Do you find that in reality you are obliged to reduce the river into a series, as it were, of level branches?—Yes, we have to check it; we have too much fall.

1292. And therefore you put a series of small weirs?—Yes.

1293. And it regulates itself in that manner?—Yes.

1294. I suppose that practically that fall would not be more than about one in 10,000; about 6 inches per mile, that is to say, a surface fall of water?—Hardly so much as that.

1295. Then if you made a conduit to work without

LONDON.

Mr. J. Muir.

11 Dec. 1866.

check it would not do to give a much greater fall than that?—No.

1296. Or you must give vertical checks as you now do?—Yes.

1297. Is the bed of the New River pitched in any way?—No.

1298. Is it in the same condition as Sir Hugh Myddelton left it?—In a great portion of its length it is.

1299. Is it of the same sectional area?—It is increased. In 1852 the company obtained an Act giving them power to improve their river from end to end by widening and straightening it. Its original length was about 38 miles, and it was reduced to 28. We have reduced it by cutting off loops, and in one case by a tunnel, and also by embankments.

1300. What is the average velocity of the flow?—I think that it is something like four-tenths of a mile per hour. That is what we require with the present consumption. We can increase that velocity as the demands in town increase.

1301. That, taken with the sectional area, gives you a volume with an adequate delivery?—Yes.

1302. What is that volume?—It is now 22,500,000 gallons per day.

1303. (*Mr. Harrison.*) And you say that you have the means of providing, if necessary, about 37,000,000 gallons a day?—I should think so.

1304. Would the aqueduct, as at present existing, pass that volume of water?—Quite easily.

1305. (*Chairman.*) What is the capital of the company; is the money capitalised?—There was an investigation in Parliament in 1852, the result of which was that the capital was fixed at about 1,500,000*l.*, or rather more, and the company were allowed to add a million to their capital by borrowing.

1306. Making it now 2,500,000*l.*?—Yes, and last session they obtained power to add a fresh capital of 500,000*l.*

1307. That would make a capital of 3,000,000*l.*?—Yes.

1308. Are you restricted in your dividend?—Only by the General Waterworks Clauses Act, to 10 per cent.

1309. What are you paying now?—I believe something like six per cent., or a little over.

1310. Have you fish in the river?—Yes.

1311. Have you any fishing rights retained for the company?—We retain in the New River itself all the fishing rights.

1312. Have the riparian owners through whose lands the river passes any fishing rights?—It has always been the custom of the company to allow persons having property on the banks to fish without hindrance. We are very particular as to strangers.

1313. Is the soil of the conduit vested in the New River Company?—Yes; the New River Company have by purchase acquired the banks of the river in a great many places, but in other places they have only vested in them that which the water covers.

1314. Do pollutions of any kind find their way into the river?—Not into the New River.

1315. Did they at any time?—Formerly they did. Drainage came into the river, but all that has been very carefully diverted and passed under or over.

1316. How many years ago was that done?—15 years.

1317. Can you say that now, as a fact, no sewage contaminates the water of the New River either from towns, villages, or single houses?—None.

1318. Then, as regards sewage contamination, the New River is as pure as it can be?—Yes, excepting the water now drawn out of the Lee. My answer to your last question had merely reference to the New River itself.

1319. As regards the New River itself your company have power enough and have accomplished the purification of the channel of the New River?—Yes.

1320. But as regards some of the water which you are compelled to take the pollution may take place before the water comes into your possession?—It may.

1321. Do you think that it would be advisable that that pollution, whatever it may be, should be utterly prevented?—Most advisable. The anxiety of the company to accomplish that freedom of the river from pollution is manifest from what they have done at Hertford. The works there cost more than 22,000*l.* They have drained the whole of Hertford, and have erected deodorising works, and in the carrying on of those works the outlay may be about 600*l.* a year.

1322. Is that entirely done by the New River Company?—Yes.

1323. They having no interest in the matter but to obtain pure water?—Yes, and it is an advantage in which the East London Company lower down participate.

1324. Do the East London Company pay any portion of that expense?—None at all; but we having done it for ourselves they get the benefit of it.

1325. (*Mr. Harrison.*) The East London Company have carried out similar works to some extent?—The New River Company, together with them, have done so; they contributed more than 8,000*l.* to the expense, and we have also done what we could to accomplish the purification of the sewage at Luton.

1326. (*Chairman.*) Then may this Commission assume that your company would give any assistance to Government to carry out a measure which should be an equitable one for the purification of the entire valley of the river Lee?—I am sure that it is a thing in which they would most heartily co-operate. Of course when the amount of contribution came to be settled a number of things would require to be taken into consideration, and I think among other things what the New River Company have already done to the same end; they have largely contributed to works for the purification of the streams.

1327. If they were called upon to do anything further they must see that it would be advantageous to themselves and to their customers?—Just so.

1328. (*Mr. Harrison.*) Did they not gain any benefit in being allowed to take a larger volume of water from the Lee, when they engaged to pay so much towards the improvement of the navigation below?—Yes.

1329. They had a *quid pro quo*?—Yes. I quite grant that they had more water on condition of their making a payment of I think 42,000*l.* towards the navigation works.

1330. What are the poor parts of London which you supply with water; do you supply St. Giles's?—Yes.

1331. Do you supply the neighbourhood of Covent Garden?—Yes. Our district is bounded on the south by the Thames, and by a line drawn from Charing Cross up to Hampstead Heath on the west, and by a line from St. Katherine's Docks up to Tottenham Church on the east.

1332. And following the Lee after that up to Hertford?—Yes; we have power to supply the intervening parishes of Edmonton and Enfield, and so on,

1333. Was there much cholera lately in the poor districts of St. Giles's and Covent Garden?—I think not; considering the kind of population, and the way in which they are housed, the amount of cholera was very small indeed.

1334. Have the metropolitan sewage works been thoroughly carried out in that district, in St. Giles's, for instance?—The upper and middle main level sewers have been constructed through those districts; the lower level sewer is not yet undertaken.

1335. (*Chairman.*) Are you rated to the sewers?—Yes.

1336. Are you within the metropolitan area for rating purposes?—Yes.

1337. Have you any idea what number of additional houses you could supply before you would get to the limit of your capacity?—We have of late years, I fancy, added about 1,700 houses annually to the number supplied.

1338. Is that increase going on now?—Yes.

1339. (*Mr. Harrison.*) And that is coincident with an actual diminution in the volume which you supply consequent upon the care which you take as to leakage?—At the date to which I refer there was a consider-

able saving in leakage. We now supply very nearly 30 gallons a head, taking the whole district.

1340. (*Chairman.*) What volume of the whole 22,500,000 gallons do you pump, and what volume do you supply by gravity?—I think that we are now pumping between 18,000,000 and 19,000,000 gallons.

1341. Do you know about what is your annual consumption of coal or slack?—I should think very nearly 9,000 tons.

1342. Is it the same material as the East London Company use, the Newcastle slack?—No, we have found the Welsh coal upon the whole answer better. We are in a district surrounded by nice houses, and the least appearance of smoke would be objectionable.

1343. What does that coal cost you per ton?—I have had it as low as 15*s.* per ton, but now the price is much higher. At our chief pumping station I should think that it may be 19*s.*

1344. Where is the chief pumping station?—At Stoke Newington.

1345. What number of boilers have you in use?—At that station we have 18, generally half on and half off. I should think that they are about 30 feet long and not quite so much as 6 feet in diameter; they have internal flues.

1346. Have you any ventilating apparatus?—Nothing but the sliding down.

1347. Have you any arrangement as to the mode in which your men fire?—Yes; they are carefully instructed in that respect.

1348. Have you double bridges?—No, a single bridge.

1349. Are the men instructed to fire to the front?—Yes.

1350. Have you any difficulty in getting your firemen to fire in that way?—No great difficulty; some men are slower than others in taking up the idea.

1351. Have you any patent in use?—No; there is no appearance of smoke at all during the greater part of the day, except just when the men are raking up.

1352. At what pressure do you use your steam?—About 35 lbs.

1353. You work expansively?—Yes.

1354. Do you give any bonus or extra wages to your men for accomplishing smoke burning?—At the end of the quarter we give them a bonus if they have behaved very well.

1355. You hold it out as an encouragement for care?—Yes.

1356. What are their wages?—The stokers, I think, have from 21*s.* to 25*s.*

1357. Do you find them residences?—In some cases.

1358. And firing?—Yes, in the case of those who live on the company's ground.

1359. You have no difficulty in consuming or preventing smoke by ordinary firing without the intervention of any special patent?—None whatever. By the use of Welsh coal it is almost impossible to make smoke.

1360. Is it anthracite coal?—It is the Merthyr coal.

1361. Do you think that you could fire with the Newcastle, slack in the same way and not make smoke?—I think not; it requires so much more care that we could not always depend upon it.

1362. Are any of your works near Hertford?—The sewage works and also the gauge which might be an interesting matter. I have drawings which I can show you.

1363. Perhaps you have also some documentary evidence which you might wish to put in upon points as to which we have not asked you. Have you kept a rain gauge?—We have.

1364. Will you let us have a copy of the rain guagings?—Yes. (*The witness subsequently furnished the same, and it will be found printed at the end of his evidence, Appendix No.* 2.)

1365. Have you any evaporation gauge?—No. (*The witness produced some plans and explained them to the Commissioners.*)

1366. Is there anything else which you wish to mention to us?—I am not aware that there is.

The witness withdrew.

Adjourned to to-morrow at 10 o'clock at Luton.

APPENDIX No. 1.

To the evidence of James Muir, Esq., Engineer-in-Chief, (referred to supra, Question 1086).

Analysis of Hertford Sewage.

College Laboratory, London Hospital,
Dec. 27th, 1866.

My dear Sir,

I have to report to you the results of the examination of the two samples of Hertford sewage which you sent here on the 15th inst.

They were contained in stoneware gallon bottles, and were labelled as follows:—

No. 1. Sample of undeodorized sewage. Dec. 13, 1866, 11 a.m.

No. 2. Sample of deodorized sewage. Dec. 13, 1866, 11.25 a.m.

Both the samples were somewhat turbid, No. 1 being most turbid; and they had the peculiar odour of sewage, although it was not very strongly marked in sample No. 2.

Their constituents per imperial gallon were as follow:—

	No. 1.	No. 2.
Soluble matter per gallon	30·33	27·00
Consisting of organic matter	5·35	2·51
„ „ mineral matter	24·98	24·49
Suspended matter per gallon	5·39	0·74
Consisting of organic matter	0·71	0·24
„ „ mineral matter	4·68	0·50
Total organic matter per gallon	6·06	2·75
Total mineral ditto	29.66	24·99
Total per gallon	35·72	27·74

It is evident from this that at first the sewage is largely diluted with water, and that after deodorization and filtration it is almost innocuous.

I remain, &c.,

James Muir, Esq. (Signed) Hy. Letheby.

APPENDIX No. 2.

New River Waterworks Company.

To the evidence of James Muir, Esq., Engineer-in-Chief, New River Waterworks Company (referred to supra, Question 1364).

Luton, Wednesday, 12th December 1866.

PRESENT:

ROBERT RAWLINSON, ESQ., C.B., IN THE CHAIR.

JOHN THORNHILL HARRISON, Esq. | Professor JOHN THOMAS WAY.

Mr. WILLIAM THOMPSON PLEDGE (Luton) examined.

1367. (*Chairman.*) Are you chairman of the Local Board of Health?—Yes.

1368. When was the Act applied to Luton?—In 1849.

1369. Who made the first report?—Mr. Creasy.

1370. Then you adopted the Act very early?—Yes.

1371. What is the population of Luton?—It is now upwards of 20,000.

1372. Is Luton a growing place?—Very much so, indeed; we have built in the last seven years 900 houses within the township.

1373. Do you know what the rateable value of the township is?—About 40,000*l.*

1374. Have you carried out any main sewage in Luton?—Yes.

1375. Has the town a water supply?—We have not a water company; it is supplied from wells; there are about 1,200 wells in the town.

1376. Your water supply is from wells?—Yes.

1377. Do you know what the main sewerage you have carried out has cost you?—No, but the clerk will tell you that.

1378. What trade is carried on in Luton?—The staple trade of the town is the manufacture of straw bonnets and hats.

1379. Does the river Lee, which supplies part of London with water, flow near to your town?—It flows through the town, and it rises about three miles from here.

1380. So far as you know is there or not any amount of pollution turned into it from this town?—I think not. We deodorize all the sewage before it goes into the Lee, beyond that there is no pollution of the water.

1381. What form of deodorization do you use?—We use chloride of lime and lime. The sewage passes through several filtering beds, and after that it is turned into the Lee pure.

1382. In what condition is the sewage after it has been so chemically treated?—I cannot speak to that.

1383. When you speak of it as being purer I assume you mean that it looks brighter?—Yes.

1384. Would you be surprised to hear that it was no purer then than before you treated it chemically?—Yes, I should be.

1385. I mean the liquid part of it?—Yes.

1386. Assuming that a chemist would tell you that all the ingredients of sewage are still in it, should you not then consider that it would pollute the river?—I should like to have some evidence of it before I gave an answer to that question.

1387. If there is pollution in the sewage, and the sewage goes into the river, does not the rest follow?—Yes, if it goes into the water.

1388. If the sewage which has been treated by you chemically is turned into the Lee, and it has still impurity in it, that also must go into the Lee?—Yes.

1389. It follows that the amount of impurity or the amount of pollution depends upon the chemical condition of the water after it passes from your works?—Exactly so.

1390. Did you clarify the sewage when you first carried out your sewers?—The sewerage was carried out before I became a member of the board, and I cannot speak to that.

1391. Before the board existed, or any works were executed, what arrangement had you with regard to privies, or waterclosets, or cesspits?—None whatever; all the sewage then passed into the Lee from any closets and surface drainage. We had no provision until we made an intercepting sewer.

1392. Were there any privies at that time built over the watercourse?—I believe there were some on

LUTON.

Mr. W. T. Pledge.

12 Dec. 1866.

the margin of the river, but I cannot speak to that as a fact.

1393. How long have you lived in Luton?—24 years.

1394. Do you know whether any privies or closets stand now on the margin of the river?—I do not know of any. I do not believe there are any in the township. I have paid much attention to this subject, and in my survey of the town I have seen none.

1395. Do you know anything of the district towards the sources of the river?—I do not.

1396. Or towards Dunstable?—No.

1397. Do you know anything of Dunstable?—No.

1398. (*Mr. Harrison.*) Can you give the population of Luton in successive decennial periods?—I cannot give you that information.

1399. Does any pollution arise from the manufactures that are carried on in the town?—We are rather troubled now with the dyeworks, although we appear to take a large amount of pollution out of the spent dye liquor, we are rather troubled with the colour that is left in it; it will not sink, otherwise I believe that the pollution in the sewage is completely taken away.

1400. Is there any other business carried on in Luton besides the dyeworks which pollutes the river?—No; I believe that the bleaching of the plait does not do so.

1401. Is the refuse from the bleaching and the dyeworks carried into your sewer?—Yes, into the intercepting sewer.

1402. No refuse passes direct into the Lee?—None is allowed to go into the Lee without going first into the intercepting sewer.

1403. Has your board ever contemplated the application of the sewage to land?—Yes, but not by way of irrigation.

1404. Have you heard that sewage elsewhere is successfully applied to land?—I have heard so.

1405. In your elevated position here I suppose there would be no difficulty in applying it to land by gravitation without pumping?—I think we could not do it without pumping.

1406. Is there any land in this neighbourhood which is suitable for its application?—I do not know.

1407. When you carried out your system of purification did you receive any sum of money from the New River Company to assist you in doing it?—I believe not.

1408. Did they assist you in any way?—Not at all, I believe.

1409. Can you give us any information as to the health of the town?—The health of the town stands rather high, and I believe it is in a tolerably satisfactory state.

1410. Do you know what the death rate of the town is?—I do not.

1411. (*Professor Way.*) Your principal manufacture here, I believe, is straw plait?—Not the manufacture of straw plait that is carried on in the villages; here it is bleached and dyed and manufactured into bonnets and hats.

1412. All the dyeing is done here?—Yes.

1413. What quantity of plait do you imagine is dyed or bleached in Luton in a year?—I am unable to speak to that.

1414. Do you know what method is adopted in bleaching the plait?—I do not.

1415. With regard to the question of sewage precipitation, which the chairman brought before you, you are aware that the evils of sewage lie in two forms: objectionable matter in a state of suspension, and objectionable matter in a state of solution?—Yes.

1416. The chemical process which you use for deodorizing is the lime process?—Yes.

1417. Are you aware that that simply removes the matter in suspension?—I am not aware of that.

1418. It enables you to send away a clear liquid without the solid parts into the river, and consequently you so far improve the condition of the sewage; but by that process, as the chairman wished to point out to you, you do not take anything out that is dissolved in the liquid, and therefore that must add to the impurity of the river?—Yes.

1419. (*Chairman.*) Is there anything further that you wish to add?—No.

The witness withdrew.

Mr. W. D. Sandoe.

Mr. William David Sandoe (Luton) examined.

1420. (*Chairman.*) How long have you been surveyor to Luton?—About four years.

1421. How long has the present system of sewerage been carried out?—For something like eight or nine years, I believe.

1422. Who devised them?—I believe Mr. Evans, who was then the surveyor to the board of health.

1423. Do you know what size the outlet sewer is?—3 feet by 2 feet 6 inches.

1424. Do you know what length of main sewer there is altogether?—The intercepting sewer is about a mile in length.

1425. What size is it?—3 feet by 2 feet 6 inches.

1426. What length of tributaries are there, do you know?—Not the total.

1427. Do you know what number of houses you have drained?—The whole of the houses are drained in the township.

1428. What sized drain do you generally use for single houses?—6 inches.

1429. Are they of earthenware pipes?—Yes.

1430. Are the main sewers ventilated?—Yes; that is to say, the intercepting sewer, but not the others.

1431. Not the sewers in the town?—No.

1432. Have you ever heard any complaints made by any persons of foul smells issuing from the gully holes or the sinks?—Very rarely. I have occasionally when the gullies have been emptied, and when the water was out, but no other complaint.

1433. Are the down spouts from the eaves of the houses connected with the drains?—There are a few.

1434. Have you any idea what number of water-closets there are in use in the town?—Somewhere from 1,000, to 1,500.

1435. If you have no water supply other than from pumps, what arrangement have you for flushing the closets?—It is chiefly done by rain water in addition to the pumps.

1436. Have the closets cisterns?—Yes; the majority of them.

1437. And are they filled with rain water?—Yes.

1438. And in addition there are pumps attached to force the water up?—Yes.

1439. Have you anything to do with the management of the closets if they get out of order; for instance, do you expect the parties to put them in repair?—Occasionally I have been called in to suggest any alteration that might be required.

1440. Are soil-pans used in the dwellings of the working classes?—A few, not a great many; they have open privies chiefly, which are constructed with proper emptying holes.

1441. You mean with a cesspit?—Yes.

1442. How many of those do you suppose there are in the town?—Somewhere about from 2,000 to 3,000 altogether.

1443. How are they emptied?—The board of health have lately adopted a plan of doing it by night-carts.

1444. Are they emptied at the cost of the owner of the house, or at the cost of the ratepayers?—We make a charge for the men's time; there is no further charge; we charge 2*s.* for the emptying of each closet, which covers the expense.

1445. Is the refuse sold to the farmers?—Yes; we are mixing it now with the refuse from the deodorizing works and the ashpits.

1446. Has the practice of emptying those places by the local board come into operation recently?—Yes, within the last six months.

1447. Then you have not had much experience of the working of that plan?—Not at present.

1448. Before that who emptied the cesspits?—The contents were taken away by farmers in the neighbourhood chiefly.

1449. Was that operation a nuisance?—Many complaints were made to the Local Board of the way in which the closets were emptied, which induced them to adopt the present plan.

1450. How long have the precipitating works been in operation where the sewage is treated by lime?—Ever since the construction of the main sewerage; it was carried out under the same contract.

1451. Do you know what amount of lime you use now in each month or year?—We used something like on an average, previous to the last six months, 80 quarters in a month, or about 20 quarters in a week, eight bushels to the quarter. Since that time we have used something like 7½ quarters, and in addition to that we use something like 40 lbs. of chloride of lime per day.

1452. What does that cost you?—About 19*s.* a hundredweight.

1453. What does it cost a day?—About 8*s.* or 9*s.*, exclusive of the wages of the men.

1454. What number of men do you employ?—Five.

1455. What do they cost you?—About 4*l.* 10*s.* 0*d.* a week.

1456. What do you estimate the present cost per annum of your outlet works?—From 400*l.* to 500*l.* a year.

1457. What volume of water have you to deal with from the sewers?—Something like about 240 gallons a minute, but that includes a large quantity of spring water. I should say that there is not more than a fifth of that actual sewage matter.

1458. There is a large amount of spring water which percolates into the sewers and drains from the subsoil?—Yes.

1459. And to deal with that water you say it costs the local board at present from 400*l.* to 500*l.* a year?—Yes.

1460. Does that include any portion of your own salary?—No, it does not; that is the actual cost of the labour at the works.

1461. What weight of solid matter do you take out of the depositing tanks per week, month, or year?—We take out something like 2,000 square yards per annum.

1462. You mean cube yards, do you not?—Yes.

1463. What weight do you think a cube yard would be—a ton?—Rather more; it is about a ton when we cart it away in a dry state.

1464. Do you actually take out of the depositing tanks 2,000 tons a year?—Yes, as nearly as possible, exclusive of the ashes and the sewage matter that we take from the cesspools.

1465. (*Professor Way.*) How do you bring it into a dry state?—We have separate settling beds which we pump the sewage from, in a semi-fluid state to the other side of the river on to some land which belongs to the Board of Health, it lies there in large beds a foot thick for about a month or five weeks, and when it is solid we wheel it out into large heaps for the farmers to cart away.

1466. It is not dry; is it not in a cheesy state?—It is very nearly dry when the farmers get it.

1467. (*Chairman.*) You say that you take out upon the average nearly seven tons a day, reckoning six working days in the week?—Yes, I think that is nearly it.

1468. Where do you suppose that comes from?—From the various closets, and there is a great deal of road refuse also that goes into the sewers.

1469. Road grit that washes through the gully holes into the sewers?—Yes.

1470. Then a great portion of that weight will be road grit?—Yes.

1471. Have you any difficulty in getting rid of that matter for agricultural purposes?—Yes, we have had great difficulty in getting rid of it up to the present time, until we mixed the nightsoil with the street sweepings; but I apprehend from the applications that I have had for the manure, and taking into account what has been actually sold, that we shall have no difficulty with it now.

1472. What price do you get per load for it, or what have you got?—At the present time we sell it at 2*s.* 6*d.* a load, which is a cube yard.

1473. About a two-horse load?—Yes, very little more than a ton, or a ton and a quarter.

1474. How far do the farmers take it?—Some of the manure that I have sold lately has been taken a distance perhaps of three miles.

1475. Have you any difficulty at any time of the year in getting rid of the accumulation?—No, other than what I have mentioned. The farmers at one time had a prejudice against it, thinking that the manurial properties were destroyed by too much water, or the quantity of lime that was then used.

1476. Do not you find it more easy to get rid of it when the farmers are not engaged either in sowing or in reaping?—Yes, that is the case certainly.

1477. Have you any accumulation on hand to any extent?—We have had a large accumulation, something like from 2,000 to 3,000 yards on hand.

1478. Do you know what the outlet works cost?—The whole of them from 10,000*l.* to 15,000*l.*

1479. Including the sewers?—Yes.

1480. Have you any plan of the outlet works?—There is one.

1481. How far are the works from here?—About half a mile.

1482. Has it never occurred to you that it would be advisable that you should permanently ventilate your main sewers?—Yes, it has; I think it is very advisable to do so.

1483. Do you ever find any smell, or have any persons complained of it when the ground has been opened to make a junction?—Not much; I have never had any serious complaint made.

1484. Do you know the difference between the condition of the sewage water before and after it has been limed?—No, I do not know that.

1485. Has your board had any analysis made of the water in those two conditions?—I believe it has been done, but not lately; not since I have been Surveyor.

1486. Has it ever been intimated to you that the liming process simply enables you to take out the solids?—It has.

1487. However bright the water is after that process, it is in reality the same sewage afterwards as it was before?—I always understood that there were certain portions in the water which could not be taken out by any known process.

1488. Would you be surprised to hear that the liming process and the use of chloride have no effect whatever, except to brighten the water and to take out the solids, or those particles which are suspended?—I am not surprised to hear that, because it seems to me feasible.

1489. Have you visited any places where sewage is applied to land for irrigation purposes?—I have not.

1490. I assume that the valley below your outlet is principally chalk?—Not the valley; the hills are all chalk, but not the valley, unless you go to a very great depth.

1491. The valley I suppose will consist of gravel or lime?—It is chiefly bog, loose bog, and gravel at the bottom.

1492. Is there any brick earth in it?—I do not know of any. I think that that would be further down than I have any knowledge of. I have heard of the

LUTON.

Mr. W. D. Sandoe.

12 Dec. 1866.

success at Croydon from applying the sewage to land for irrigation.

1493. Do you think it would be advisable, if your board could save their 500*l.* a year and get rid of the nuisance altogether, to try that process?—I should think it would be.

1494. If in this district you could so apply that sewage to the land as to produce 50 or 60 tons of green crops per annum off each acre, do you not think it would be advisable to do so?—I have no doubt that it would be a great advantage to apply the sewage in a liquid state.

1495. You are expending at the present time 500*l.* a year apparently without any use or advantage, and if a chemist will tell you that his experience enables him to say that you have made no alteration in the sewage which you have subjected to your process, except taking out the solids, and that is still sewage after that treatment, is not that an additional reason why something more should be done, and that you should purify the water before it flows on to London to be drank?—Yes.

1496. Especially if that could be done at a less cost to the board than it has now to bear?—Yes.

1497. (*Mr. Harrison.*) The town of Luton is situated on both sides of the river, is it not?—Yes.

1498. Has the system of sewerage been extended to both sides?—Yes.

1499. Has it been carried under the river in order to be connected with your main sewer?—Yes, under the Lee.

1500. You have stated that there are about 1,000 waterclosets and about 2,000 cesspits in the town?—Yes.

1501. For a population of 20,000 persons?—Yes.

1502. Are the waterclosets chiefly in the houses which are occupied by the wealthier inhabitants of the town?—Yes.

1503. How are the cesspits situated with respect to the houses generally?—The majority of them are something like seven or eight yards from the houses.

1504. Are any of them close to the houses?—Some of them are.

1505. Are any of them placed under the houses?—Not one that I know of.

1506. In the case of those which are near to the houses, have you ever known them to be the cause of ill health?—No; but I have had some complaints as to those which have been close to the houses, and I have recommended that they should be filled up, and that waterclosets should be substituted.

1507. Are they generally closed over the top?—Not generally so; there are some that are closed, but it is not the general rule.

1508. Are ashes thrown into them in any cases?—I have found a good many which have been altered within the last 12 months. We altered them so far as making proper emptying holes and cesspits awayfrom the ashes and closing the cesspits on the outside.

1509. These are the steps you have taken to separate the ashes coming from the houses entirely from the watercloset refuse?—Yes.

1510. Then there are ashpits and cesspits?—Yes.

1511. The cesspits you have had covered?—Yes.

1512. Are those cesspits sunk into the ground?—Yes, about 3 feet down is the usual depth.

1513. What is the character of the soil in which they are made?—The principal portion of the town is upon chalk.

1514. What steps are taken in constructing those cesspits to prevent the matters contained in them escaping into the chalk?—They are steined inside with brickwork, and in some cases brickwork in cement, but not in all.

1515. Are those cesspits water-tight?—Those that have brickwork in cement would be water-tight, but not the others.

1516. Where are the wells situate from which you say the inhabitants obtain their water with reference to the cesspits?—The cesspits are generally at a distance from the wells, from 7 to 10 yards; we have the wells now at the greatest distance we can from those places.

1517. Do you think that any such care as that will prevent the water from the wells and the refuse from the cesspits meeting together in the chalk subsoil, especially as you are withdrawing in your main sewer and your branch sewers so considerable a quantity of water through the chalk?—No, there is no doubt that it must be the case.

1518. That the cesspits do pollute the wells?—Yes, to a certain extent, there is no doubt of it.

1519. Do you think that that can be a satisfactory or safe water supply for the town under such circumstances?—I do not think it is.

1520. Do you not think that that is a point that ought to be brought under the notice of your local board so as to prevent the continuance of such a system?—This matter has been brought to the notice of the board, and in addition to that there was a water company started sometime since which it was contemplated would entirely obviate the difficulty then, but the works have not yet been carried out. I believe they are in progress, at least I have heard so.

1521. Have the medical men of the town on any occasion complained of the water that was supplied to the inhabitants for drinking purposes?—In one or two instances I have heard a complaint, but no general complaint has been made.

1522. What steps, if any, have you taken in those cases to prevent the continuance of the evil?—In any case where I have found any mischief arising from a drain, (I have not heard of a case arising from a closet) I have altered it at once.

1523. How far is the outlet of the main sewer from the town?—About half a mile.

1524. You say that you take the solid refuse and convey it into large shallow tanks?—Yes.

1525. You then, I suppose, allow the water to evaporate from the surface until the solid matter becomes of a certain consistency?—Yes.

1526. Does any smell arise from the tanks during that operation?—We do not find that there is any unpleasant smell.

1527. That is in consequence, I suppose, of your applying chloride of lime?—Yes.

1528. You applied that in consequence of finding that there was something objectionable?—No; the principal reason why I recommended it to the board was on account of the dyeing.

1529. Did you find that the effect of using chloride of lime was to diminish the pollution of the water by the dyeing process?—Yes, very much so.

1530. What was the effect?—It took the colour out.

1531. (*Chairman.*) Where could water be obtained if works were established for supplying the town?—From an artesian well, I imagine.

1532. And by the use of steam power?—Yes; I believe there would not be a sufficient supply of water from the river.

1533. Do you know what estimate has been made for the purpose of carrying out such works?—No; I have not heard.

1534. (*Professor Way.*) In your liming process, how is the lime applied?—By Higgs' patent; simply by mixing it in pans, and forming a kind of thin cream.

1535. How is that apportioned to the sewage?—It is managed by a tap which either flows with more or less water, as is required for the quantity of sewage coming in.

1536. Is it passed into the conduit that brings in the sewage?—Yes, and it is mixed with stirrers, which are worked by a water-wheel.

1537. Is it any distance above the subsiding reservoirs?—No, close to them.

1538. Have you more than one subsiding reservoir?—Yes.

1539. Is one filling while the other is subsiding?—They are all working regularly round; there are three large beds something like 1,000 yards square.

1540. Is there much collection of matter at the top of the reservoirs?—Not on the surface of the water.

1541. In running off the liquid do you run it through an opening a little distance above the bottom of the tank?—They are always running off.

1542. Is that from the surface outfall?—Yes, it is over the surface in working the water-wheel.

1543. I am speaking of running the liquid out of the tanks; how does the liquid overflow?—It works on a level; all the beds work on one level.

1544. In flowing into the outfall does it flow from the top?—Yes.

1545. Is there any plank to keep back the solid refuse which collects at the top?—Yes.

1546. (*Chairman.*) Do you use a skimmer?—No, we do not require anything of the kind.

1547. (*Mr. Harrison.*) Is the water which is pumped from your wells very bright?—Yes, it is very clear water.

1548. Are you aware that sometimes water is even more agreeable to the taste after it has been polluted by the drainage of cesspits?—I have read such an account.

1549. If so, do you not think it would be well to look into the condition of the water in this case, and not merely be guided by its appearance or its taste?—I should think it would.

1550. (*Professor Way.*) I daresay you have heard that lately in the city of London numerous wells have been shut up on the authority of a report made by Dr. Letheby?—I have.

1551. (*Chairman.*) Have you any idea what volume of dye water passes into the sewers from the intercepting one?—I have not.

1552. What number of dyeworks are there in the town?—I do not know.

1553. Do the dyers themselves attempt by any means to clarify the water or to take out any solids before they pass it into the sewers?—I do not think that that is the case; it may be so in one or two instances.

1554. You do not, perhaps, know the substances which are used in dyeing?—No.

1555. Are there any breweries in the town?—Yes.

1556. Are they large ones?—One is a tolerably-sized brewery.

1557. Do you know whether the brewers pass any washings of barrels or spent hops, or anything of that description, into the sewers?—I believe they pass the washings of barrels and those things into them.

1558. Any spent hops or spent grains?—I think not.

1559. Are there any malting places in the town?—None that are at work.

1560. Are there any mills above or below the town immediately on the river?—There is one immediately below the town, not above.

1561. What length of highways have you under your charge?—Somewhere about 30 miles.

1562. Of what are the street surfaces generally formed in Luton?—They are made of macadam.

1563. Are they all macadamised?—Yes, all of them.

1564. Have you any idea what weight of stone or flint is put on to the streets in a year?—It is from 2,000 to 3,000 cubic yards.

1565. Does that nearly correspond with the quantity of material that is taken out of your settling tanks. I think you said that you take about 2,000 tons out and you put about 3,000 tons on to the roads?—Yes, but there are a great many roads that do not wash into our sewers.

1566. The whole of the material which you put on is ground up by the action of the traffic over the roads during a year?—Yes.

1567. How much does it cost per cube yard to dress a road; is it flint?—Yes; the flint we use costs us about 5*s.* 6*d.* per cube yard.

1568. Do you use anything besides flint?—We put granite down upon some of the principal streets.

1569. What does that cost you per cube yard?—About 12*s.* 10*d.*, delivered at Luton.

1570. How many square yards of road do you repair out of one cube yard of material?—About six yards, that is to say I mean six yards across the road; it would be about 30 or 36 yards, not more than two inches thick.

1571. Are your side channels paved, or are they generally macadamised?—They are generally paved.

1572. After you have had a heavy fall of rain the grit washes into the channel and washes from the channel into the sewer?—Yes; but we have gully pans which take a certain portion of it.

1573. How much will a gully pan hold?—Not so much as half a cube yard, not more than a quarter.

1574. If you have a heavy rainfall will the gully pan be filled in a few seconds?—That depends upon the situation a great deal; at the bottom of the hill it would no doubt be the case.

1575. It would not last for many minutes?—Not in the lower part of the town.

1576. For any intercepting purposes it is a mere delusion?—It does not stop a great deal.

1577. Do the drains choke at any point?—No.

1578. Can you flush them artificially?—No.

1579. Have you never had occasion to resort to artificial flushing?—No.

1580. And the ordinary action of the water is sufficient to keep your drains in operation?—Yes, just so.

1581. To flush out all that weight of material that there is towards the outlet?—Yes.

1582. What is the fall towards the outlet?—I cannot tell.

1583. Have you often had occasion to open drains in order to put in connexions?—Very often.

1584. Have you noticed the condition of the drain when you have opened it; have you found any deposit in it?—Very rarely; in some situations, but the drains are generally pretty clean.

1585. Of what sizes are the tributary drains?—From 2 feet down to 9 inches.

1586. What are the 2 feet drains made of, brick or earthenware pipe?—They are made of brick, $4\frac{1}{2}$ inches.

1587. Are they circular or egg-shaped?—Some are circular; they are chiefly egg-shaped.

1588. Of what material are the 18-inch and 12-inch drains made?—They are earthenware pipes.

1589. I suppose it is in fact the large volume of subsoil water that is constantly running through your sewers and drains that keeps them clean?—Yes.

1590. If you had less of that water there would be more impurity in the drains?—Yes.

1591. That spring water is a sort of safety valve carrying off what would be deadly for want of ventilation?—Yes.

1592. If ventilation is a benefit under any conditions, do not you think it would be a great benefit, although your sewers may not be so foul as in other places, to have them fully ventilated?—Yes.

1593. (*Mr. Harrison.*) Have there been on any occasion any complaints made in the upper parts of the town of bad smells arising from the drains?—I have occasionally heard a few complaints made when the house drains have not been properly trapped.

1594. (*Chairman.*) If there is a foul smell before, what do you think becomes of the gas when they are trapped?—It must remain in the sewer.

1595. But will it remain there; if you do not control its coming out it will come out in its own way, and if your sewers are not properly ventilated I am afraid they will do as much harm as good?—No doubt they ought to be ventilated.

1596. (*Professor Way.*) You stated I think that you had considered the question of applying the sewage direct to the land?—Yes.

1597. Has the subject been taken up at all by the local board of health?—No, it has not.

1598. In considering that matter, probably the quantity of water would have something to do with it?—Yes.

LUTON.

Mr. W. D. Sandoe.

12 Dec. 1866.

1599. Are you aware that at Croydon, where the sewage is applied to the land, the quantity of water, as in your case, which passes into the sewers is from two and a half to four times as much as the bulk of the sewage itself?—Yes, there is no doubt of that; that is the case to a certain extent here, but I think the difficulty here will be the land.

1600. (*Chairman.*) Is there anything further which you wish to add?—I think not.

The witness withdrew.

Mr. G. Bailey.

Mr. George Bailey (Luton) examined.

1601. (*Chairman.*) You are clerk to the local board of Luton?—Yes.

1602. How long have you held that appointment?—Since July 1851.

1603. Were you appointed upon the first formation of the board?—Almost; the board was formed about May 1850.

1604. Immediately upon the formation of the board, or was it after your appointment, that they began to carry out a system of main sewerage?—The board commenced immediately to make sewers, but the first sewers that were made were not upon a well defined system although they were well laid out. In 1856 a scheme was devised by Mr. Evans, who was a civil engineer, and the whole of that scheme was carried out under the superintendence, in the first instance, of Mr. Bazalgette and subsequently of Mr. Page; those gentlemen frequently came down to look

1605. Had the local board any special reason for carrying out a system of sewerage at that time; was any pressure put upon them by official authority?—A suit was commenced against us in 1856 or the end of 1855. A bill was filed in Chancery by the Attorney-General at the relation of John Shaw Leigh, the owner of Luton Park, and the information and bill of complaint were filed on the 13th December 1855. Evidence was given upon the occasion. I was present and gave evidence with numerous other persons, but the evidence was given by affidavit. The result of the suit was an injunction, a copy of which I hold in my hand, and, with your permission, I will just read the end of the bill of complaint—"Prayer. The infor- "mant and plaintiff pray as follows: 1. That the "township of Luton local board of health may be "restrained, by the order and injunction of this "honourable court, from causing or permitting any "sewers or drains, or the filth and matter coming "therefrom, to empty themselves or run into the "river Lee, and from otherwise polluting and injur- "ing the said river, or keeping the same sewers and "drains so as to be a nuisance or injurious to public "health. And also from opening any new drains or "sewers communicating with or discharging them- "selves into the said river, or any openings in sewers "already communicating with the said river, by "means of which openings additional sewage would "be brought into such sewers, and from in any manner "increasing the sewage passing into the said river. "2. That the defendants may pay the costs of this "suit." I may say that we never paid the costs. I do not know the reason why, but they were never pressed for. What the New River Company had to do with it I do not know.

1606. Were your intercepting sewers and your disinfecting works devised in order to comply with the terms of the injunction?—Yes. After that we had a correspondence with Mr. Higgs, a gentleman who seemed very ingenious in his ideas; he had invented a system of deodorizing the sewage and he had taken out a patent. I do not think I have a copy of it, but it can be obtained. The result of the communication or of my interviews was this, that the board of health purchased the patent for 700*l.*

1607. They gave Mr. Higgs 700*l.* for his invention?—Yes; and we were compelled to use the process. I believe that it has been a great saving to the town, and has prevented litigation, probably many thousands of pounds, and we have lived in peace.

1608. (*Mr. Harrison.*) Does Mr. Higgs in that agreement undertake to purify the water so as to prevent your being further interfered with by parties below?—No; but the suit has this effect, that so long as we use his patent properly the court have no power over us.

1609. (*Chairman.*) You have complied with the order of the court?—Yes; it says, after stating that it shall not flow into the river, "except such sewage "water or matter shall have been previously subjected "to the process for purification, known as Higgs' "process." I believe Mr. Higgs has been dead for some time.

1610. I suppose the patent has expired?—I do not know.

1611. (*Professor Way.*) Were affidavits referring to the nature of the patent put in?—No. The fact was, I believe, that Messrs. Baxter, Rose, and Norton were concerned for the informant or the plaintiff. I believe that Mr. Baxter was very much interested in this patent, and he came down to Luton, and so long as we carried out the patent everything appeared quiet and agreeable. I have been informed since that he was interested in it.

1612. Have you carried out the same system since that time?—Yes.

1613. And it is being carried out now?—Yes.

1614. At a cost of something like 500*l.* a year?—I believe that is correct.

1615. Have the board discussed at any time the propriety or otherwise of applying the sewage to land for irrigation purposes?—They have; the surveyor has stated the contrary, but I do not think he was present at the time. It has been in contemplation, although I do not think there has been any formal resolution upon it. I have gone a little into the subject myself, and I have an idea that about 500 acres of land would receive the whole contents of the sewers from this town.

1616. What is agricultural land worth in the valley below the town?—I think about 30*s.* an acre per annum.

1617. Do you think it would be possible either to lease or rent 150 or 200 acres?—Mr. Leigh owns the territory here, or Mr. Crawley; they own an immense quantity of land.

1618. Have you ever talked over with the board the propriety of providing a water supply for the town?—Yes. I have been an advocate for that all along, although there have been opponents to it on the board; but to the credit of the present board I may say that the whole of them consider it is a most important thing to have waterworks in their own hands. A company was started some years ago, but they have done nothing; they have had every encouragement, and they obtained an Act of Parliament, but it is a dead letter.

1619. If you could afford to supply any small tenement, or cottage dwelling, with as much water as they required from Monday morning to Saturday night for 1*s.* a quarter, do you not think it is very desirable to do so?—I should imagine that it could be done for that price.

1620. Then the poorest person would be extravagant to use a pump, and it would be dangerous to keep the pump in existence?—Yes.

1621. The Public Health Act gives you power to acquire a site upon which to erect waterworks; also the power of borrowing money and repaying it by annual instalments; it further gives you a compulsory power to supply every house within the district at a certain price?—Yes, if it does not exceed 2*d.* a week.

1622. (*Mr. Harrison.*) From the evidence of the surveyor as to the volume of water coming out of the sewers you have constructed it would appear that the

subsoil of the valley must be saturated with water?—I think it is.

1623. He stated that there were about 2,000,000 of gallons a day collected by the sewers; if that is the character of the chalk in the district I should imagine that by careful examination of the district higher up the valley there would be no great difficulty in conveying such a draught through the subsoil and collecting the water at such a height as to supply this town without any difficulty, and without pumping?—Yes, I should say so.

1624. The 2,000,000 of gallons a day which are delivered from your culvert close below Luton would be a water supply for a town a mile or two lower down at the rate of 100 gallons a day for your present population?—Yes.

1625. (*Chairman.*) Are there any gasworks in Luton?—Yes.

1626. Do they belong to the board of health, or to a company?—They belong to a company. I am a shareholder in it, and they have been very successful.

1627. Have you contemplated that they might be acquired by the local board?—Yes; and there has been a conversation upon that subject.

1628. Does the local board possess any property of any kind?—They only possess their own board room, which they purchased about eight or nine years ago. I suppose that that is worth about 800*l.* or 900*l.*; they also possess and occupy the land where the deodorizing works are erected, and which cost them about 950*l.*; they bought the land very cheap at the southern end of the town; it is valuable land; they possess the deodorizing works and the intercepting sewers which have been made.

1629. Have you, as a local board, any interest in the tolls taken at markets or fairs?—The board of health this year have purchased the lease of the tolls for 75 years, from Mr. Leigh, the lord of the manor, at a rental of 150*l.* a year.

1630. Will that enable you to construct a new market or regulate the markets which exist?—Yes; we have at the present time that matter under consideration; it is going on actively.

1631. Will it produce a larger income to your board if properly managed?—Yes, I am sure of that.

1632. Have you any baths or wash-houses for the use of the public?—We have not. There are in the town some public baths, which have been erected by a private individual, and they are just completed.

1633. Have the local board a public library?—No, they have not.

1634. Would not the Libraries Act enable you to establish a library?—I am of opinion that it would.

1635. What number of members constitute your board?—Nine.

1636. Is that number considered sufficient?—It is; but I think it is very small, comparing this town with other towns, for in some towns of equal size I apprehend there would be 15 or 16 members, and perhaps 20.

1637. What is the area within the jurisdiction of the local board in acres?—I do not know that, but Davis's "History of Luton" will, I think, give it.

1638. Did you attend the inquiry that was made by the inspector in the first instance?—Yes, I did, when Mr. Cresy came down.

1639. (*Mr. Harrison.*) Were the New River Company at all interested in the suit in chancery?—I could not say; but I have no doubt they were. I think the least they could do was not to press the costs upon us, and they did not. I am of opinion that it would be very much to their advantage if they would take this question up. I know that in London there is an idea that the water of that company is not good. I have read many chemical accounts about it; what may be the cause I do not know; we do our duty and we are satisfied.

1640. Have they assisted you in any way?—No; but I think they are bound morally to do so; they use the water; it goes on to Hertford, and then it goes into the river there. The river now is better than it ever was, and we strictly carry out the injunction.

1641. (*Chairman.*) You are acting within the four walls of the law, and you strive to do your best?—Yes; and we have done it.

1642. You are willing to do better if you can, but hardly know how to do it without incurring extra cost to the town?—I think the board would be willing to incur the cost if it was not an extravagant one.

1643. (*Professor Way.*) You have 500*l.* a year now to pay?—Yes.

The witness withdrew.

Mr. Kitt Tomson (Luton) examined.

1644. (*Chairman.*) Are you a surgeon residing in Luton?—I am.

1645. How long have you resided here?—For 20 years.

1646. Have you been in practice as a surgeon during that time?—Yes.

1647. Do you hold any public appointment?—I am medical officer to the board of guardians for the parish of Luton.

1648. What number of acres does that cover?—Nearly 16,000.

1649. Are you the sole medical officer for the parish?—Part of the hamlet has been taken off within the last week or two, but before that I was the sole medical officer.

1650. Have you anything to do with the town proper?—Yes, with the whole of the parish of Luton.

1651. Are you at all connected with the local board?—Only very occasionally.

1652. What type of disease is most prevalent in this parish?—We have every autumn sometimes more and sometimes less of typhoid fever.

1653. What should you, as a surgeon, say was the origin of typhoid fever?—It is partly owing to atmospheric influences, and chiefly owing to the quality of the water. I have stated this before.

1654. I suppose that over-crowded tenements, bad food, and exposure to bad weather, all conduce to it?—Yes; but typhoid fever has generally been found in my experience, which has been very great, and I have had it twice myself, principally in connexion with the drinking of impure water.

1655. Do you believe that that poisons the blood?—Yes; in fact, I believe that it introduces the poison itself.

1656. Typhoid fever is a blood disease?—Yes.

1657. The blood gets into a sort of ferment?—Yes. I believe that the poison acts as yeast does in beer.

1658. It is a zymotic disease?—Yes; at the present time I have amongst many isolated cases two which, to my mind, rather illustrate my position. There are in the town two blocks of houses separated by walls from any other houses, and the inhabitants of all those houses drink water obtained from the same well, and almost every inhabitant of those houses is suffering from fever at the present time. I have seen the water frequently, and I have observed repeatedly that after the slightest shower it becomes perfectly thick and unfit for human consumption. I have brought here a sample, obtained under favourable circumstances, of the water taken from one of those wells (*handing in the same*). I obtained it last night. I have not submitted it to analysis, but at the bottom of it you will perceive that there is a slight deposit.

1659. Having these fever cases under your care, and believing that the water is the cause of the disease, do you not think that this is a case into which those who have charge of the public health ought seriously to look?—I do.

LUTON.

Mr. K. Tomson.

12 Dec. 1866.

1660. Do you know the condition of the cesspits and the wells generally throughout Luton?—I believe that lately, when new buildings have been erected, the board of health has used every precaution, it is sometimes impossible to construct privies and waterclosets, and to provide the necessary ashpits, and so on, without the well water being affected. I believe that they have been exceedingly careful of late in doing that, but from the limited space they have to do it in it is sometimes very difficult.

1661. Do you know how near the well from which you have obtained the sample of water is to an adjoining cesspit or privy?—There is a large drain that conveys all the refuse from the house, and I think it is two feet away perhaps, not much more. The drain is just against the house; the yard is on an incline and slopes towards it; the ashpit is just at the top of the incline and the privy also.

1662. (*Mr. Harrison.*) How far are they from the well?—I think about as far as from here to that bench (*describing*).

1663. (*Chairman.*) Is it a pipe drain or a brick drain?—I do not know.

1664. Your opinion is that there is a communication of some kind between them?—Yes. I conclude that all the surface matter is washed into the well; there is leakage into the well in that case as in other instances.

1665. Are those wells at any time cleaned out?—I am not aware of any instance where they have been cleaned out, except where they have required to be deepened, which in dry seasons is sometimes the case.

1666. When the water falls off they sometimes deepen them?—Yes, and then a large quantity of muck is taken out that you could hardly stand by; two years ago I saw that done.

1667. Of what depth are those wells?—They vary according to the position of the town, but the well to which I have referred would be about 40 feet deep.

1668. Is a pump used to empty it, or is it drawn up by buckets?—It is drawn up by buckets.

1669. Is the top of the well open?—Yes. They have wooden lids.

1670. I suppose the water is slopped about at the top and may soak back again into the well?—Yes.

1671. (*Mr. Harrison.*) At what depth below the surface would the water be in a dry season?—Sometimes it is all gone; in the last dry season that we had nearly half of the wells in the town were empty.

1672. At what depth below the surface is the bottom of the well?—That varies; but from 6 feet to 60 feet or 70 feet, according to the position of the well in the town; it varies very much indeed.

1673. In what particular districts of the town, or can you give the names where there is generally the most fever?—During the greater part of this year it has been just beyond the township, at a place called Brown Brick; it adjoins, but it is beyond the town; it is just by the deodorizing works.

1674. Can you refer to any disturbing influences which exist there?—I should say it is from the same cause, the impurity of the water. The board of health have no jurisdiction there at all, and therefore all the disturbing causes are perfectly uninfluenced.

1675. Have not the parish authorities any jurisdiction there?—They have, and they employ an inspector of nuisances, who is very active; but, with the greatest respect to him, the fact is that he does not possess that amount of scientific knowledge which would enable him to detect impurities and so forth. As far as local nuisances are concerned he has been very active in the discharge of his duties, and has done a great deal of good in the last year.

1676. Within the town are there any places to which you can point where fever prevails?—I may allude to a spot where that water was obtained (*pointing to the sample*); there they have had fever for the last three months, and in fact it has never been out of the place. That is Queen's Square, which is nearly opposite the national schools, in the south-western part of the town. We had it about two years ago in the north-eastern part of the town, but that was a remarkable instance, that was before that part was drained. In one street almost every house had fever, but we have not had a case since the place has been drained. Most of those streets are admirably fitted for drainage, being almost all upon an incline. I may mention that we have been very much indebted to the wet seasons, which have flushed our sewers for us, and we have had less sickness rather in wet than in dry seasons. With regard to the ventilation of the sewers, I cannot quite agree with the surveyor, as the odour from the gully holes is in my opinion most offensive. I often go out at night when the influence of the sun has gone, and the smell from the gully holes is most offensive in a dry season. They are more so at night, especially along George Street. I frequently have the smell in my own scullery, which is connected with a main sewer, and I often have to pour down carbolic acid, and many other things.

1677. What material is used for bleaching the plait?—I will give you a list of them. The bleaching materials consist of oxalic acid, salts of tartar, salts of sorrel, pearl ash, and brimstone—all these are used in bleaching. In dyeing the two principal articles used are logwood and sulphate of iron. For the black they principally use cuba fustic, yellow wood, and camwood. Most of these are dyes obtained from the West Indies or South America, and are vegetable dyes. They use Brazil wood and indigo, blue paste, which is sulphate of indigo, and they use a small quantity of sulphate of copper; shumach is also used, and madder.

1678. (*Chairman.*) These materials when expended, we have been told by the surveyor, pass into the drains, and then into the outlet sewer. May they not filter in their course into some of the wells?—They may do that, and no doubt they do.

1679. Are any of those ingredients poisonous?—Yes, oxalic acid is a most powerful irritant poison, and also sulphate of copper, that is poison in very small doses. They use sulphate of iron principally, and sulphate of copper in a less degree.

1680. (*Professor Way.*) Do they not use chromate of potash?—I think not; I am not aware that they do.

1681. (*Mr. Harrison.*) Can you say whether the well you have spoken of, in the south-east part of the town, and from which you took the water, is dried up in the manner you have represented in the summer time?—I have a strong impression that it is, but I cannot state certainly. The greater part of the wells were dried up in the summer two years ago.

1682. Is there any information you can give us as to the health of the town of Luton at the present time as compared with its state in past years?—Yes. I may say that I have no doubt that what the board of health have done, both paving and sewering has very much improved the condition of the town; at the same time there is a great deal more to do. We are very much indebted to the board of health for what they have done. I may say that the state of the public health, in my opinion, would not be so well discovered in the actual mortality as in the condition of the health of the people, and the health of the people generally is of a higher tone, excepting in very bad seasons when many of them are very poor. In good seasons, however, their health has very much improved, and they are not so susceptible to all those little ailments which, in my judgment, are more characteristic of the general health of the town than the mortality, nor so susceptible to any of the more severe epidemics.

1683. (*Professor Way.*) The death rate is not an absolute guide?—I do not think it is; I think that that is rather too much insisted upon.

The witness withdrew.

Mr. W. D. SANDOE further examined.

1684. (*Mr. Harrison.*) Have you heard the evidence that has been given by Mr. Tomson?—Yes.

1685. You have supposed the volume of water issuing from your works to be about 2,000,000 gallons a day?—Yes.

1686. Do you find that that varies very much in different seasons of the year?—Yes, it does; that is the calculation now just at this moment; it has been a very wet time.

1687. What was the volume of water that passed out of your sewer during the dry seasons of 1864 and 1865?—I should say about half the quantity.

1688. Was it half the quantity?—I think so; our intercepting sewer, passing as it does through a very large portion of the valley, and cutting through several very strong springs, would, I think, be calculated to keep up a supply of water in our sewers more than would be found even in many of the wells of the town, on account of their being so shallow.

1689. Is there any considerable rise from the river up towards the town?—Some of the higher parts of the town are something like 70 or 80 feet above.

1690. Mr. Tomson stated just now that the wells in many parts of the town were sunk to the depth of 60 or 80 feet?—Yes, and some of them down to 90.

1691. When there is an abundance of water to what height would it rise in those wells?—Six feet is the outside quantity at that great depth.

1692. Do you think your sewers collect water from the chalk at all in the neighbourhood, or such wells as those spoken of?—No; the greater part of our water is nearer to our works, that is, the lower portion.

1693. The answer that you gave to the question put as to the flushing of the sewers by the large volume of water that is discharged through them is not, I suppose, applicable to the branch sewers leading to the upper parts of the town?—It is not.

1694. In those parts of the town where you have opened out the sewers to put in branches, what have you found to be the condition of the sewers?—They have been invariably clean on account of the rapid fall; they have all of them excellent falls in the upper part of the town.

1695. (*Professor Way.*) They get flushed by the rain, do they not, to a considerable extent?—Yes; and it must be understood that there is a very large quantity of water used in washing and bleaching and dyeing the plait, which would of course add very materially to the cleansing of those upper sewers; in many parts of Luton very many of these small dyeing places are to be found where a very large quantity of water is used.

1696. Your sewer evidently lets in a large quantity of water in the lower parts, but is it equally well constructed to let out water in other parts?—It must be understood that in the portion which I allude to especially, very great engineering difficulties were encountered at the time of making it, and that very strong springs were cut through, which, as I may say, formed the upper side of the sewer, or the hill side; the lower side was nearer to the river.

1697. The springs, as I understand you, were so violent in some cases that there was a difficulty in making the sewer so complete and so water-tight as in other places?—Yes, that was the case.

1698. May not the sewage water escape in the dryer parts of the town from your sewer into the subsoil, and so reach the well?—I do not think that that would be so in the upper parts of the town, because the difficulties which I have spoken of were not encountered there, and therefore the sewer would be better.

1699. Were earthenware pipes generally laid there?—Yes, in the upper part of the town.

1700. You can make pipe drains more water-tight than brick drains?—Yes, and I should recommend them in all cases.

1701. (*Chairman.*) Do the larger sewers or drains ever choke during a thunderstorm from there being too much water?—We have found that to be the case; but of late, or within the last two years, we have made a very large storm-water bed, which would cover something like an acre of ground, and that takes in the overflow and relieves our sewers very materially; we therefore do not suffer from flooding now.

1702. You have ventilators in your outlet sewer I believe?—Yes.

1703. How are those ventilators formed; are they mere openings at the surface?—Yes.

1704. Up to the open air?—Yes, with open gratings.

1705. Are you acquainted with the ventilators used in London, and which you may see on the surfaces of the streets?—Yes.

1706. Are yours of that kind; is there a cast-iron grating on the top?—Yes.

1707. In the ventilation of sewers are you aware that it is the upper ends of the sewers that require ventilating more than the lower ends?—Yes.

1708. That is to say, that gas runs up hill with the same facility that water runs down, and reaches the higher points?—Yes.

1709. Did you hear what Mr. Tomson stated about the sewers smelling most offensively in the night time?—Yes; but I have only heard one or two complaints of that. I do not wish at all to contradict what he said, but I only know that no official complaint has been made to me on that point.

1710. Are you inspector of nuisances as well as surveyor?—Yes.

1711. In what part of the town do you find the greatest number of nuisances?—In the outer portions of the town; in the south-east direction there are more I should say than in any other part.

1712. Do you know the locality where typhoid fever, as Mr. Tomson stated, is prevailing?—Yes, I know the part alluded to.

1713. In your inspections in places where fever has been prevailing, have you ever seen anything that, in your judgment, might account for it in any way; any accumulation of foul matter or contamination of the water?—Where I have seen anything of that kind I have ordered its immediate removal in all cases; I have sent our own cart at once to remove any nuisance that I might have found.

1714. Has it ever occurred to you that an empty cesspit might for the time being be more injurious than a full one?—Yes, and I have always taken the precaution to use disinfecting powder; we have used chemical disinfectants in very large quantities during this year to sprinkle over the surface, and prevent the smell which sets up, whenever a place like that is emptied. Another precaution that I have taken has been to send men with the disinfecting powder to sprinkle in the various yards in the town.

1715. You have done that during the last summer?—Yes.

1716. Was it done at any time before the last summer?—The board of health did not take this matter in hand until the present year.

1717. Have there been any cases of cholera in Luton?—Not that I am aware of.

The witness withdrew.

LUTON.

Mr. William Willis (Luton) examined.

Mr. W. Willis.

12 Dec. 1866.

1718. (*Chairman.*) What business are you engaged in?—I am a straw hat manufacturer.

1719. Where are your works situate?—The largest works in the town are situated in Castle Street. We have some small places about the town.

1720. What number of hands do you employ?—In the town of Luton I employ about 300.

1721. Do you bleach and dye the plait?—We bleach nearly all of it, and we dye it occasionally.

1722. What materials do you use in your manufacture?—In the bleaching part of it we use oxalic acid, and salts of sorrel, and salts of tartar.

1723. Does that list (*handing the same to the witness*) contain all the ingredients that you use?—Yes, I think this enumerates nearly the whole of them; we use oxalic acid and salts of sorrel to a large extent.

1724. About what weight of these materials do you use in the course of twelve months?—From one to two tons a year of oxalic acid and salts of tartar besides brimstone; that is a very heavy item.

1725. About what weight of straw do you deal with annually?—We bleach about 8,000 scores a week.

1726. Of what weight is a score?—I cannot say.

1727. What does a score mean?—It means 20 yards in length of plait.

1728. I suppose it varies in breadth, thickness, and width?—Yes; if it is of a light and single make the weight is lighter, if it is a heavy make of plait and double straw it is considerably heavier.

1729. About what weight of dyeing materials do you use?—We are but small dyers, but we have a large quantity of plait dyed in various parts of the town; we only dye to keep the men employed when they are not bleaching. I think that we use the weight I have given you in acids and salts of sorrel.

1730. What weight of brimstone do you use?—I cannot state at the moment.

1731. (*Professor Way.*) Is the brimstone burnt in order to bleach?—Yes.

1732. Do you burn the sulphur into sulphurus acid?—Yes; it is that which destroys the alkali in the plait and turns it white. I think I may say that we use half a hundredweight a week of brimstone; perhaps two tons weight of brimstone in a year.

1733. (*Chairman.*) Do you attempt to separate the solid portions of the bleaching and dyeing materials before the refuse is passed into the drains or sewers?—No, it goes off as refuse after it is done with altogether; they are all mixed together in a tub, a certain quantity of acid, a certain quantity of tartar, a certain quantity of sorrel are all mixed together when the plait is passed through it ready for the brimstone to be put to it; it all passes away into the sewers.

1734. (*Professor Way.*) What is the nature of that liquid, what is its appearance as it passes away?—The appearance of it would be a very dark brown colour.

1735. Irrespectively of the dye?—I do not speak of the dyeing, I confine myself exclusively to the bleaching. It probably depends upon the nature of the plait which passes through it, but there is always a very thick mud. Soap and soda are used in washing the plait, and after it has been cleansed it passes through the bleaching liquid to destroy the effect which the soap has had upon it in cleansing; it would be injurious if it remained in the plait; the final operation is the brimstone being ignited.

1736. (*Chairman.*) What volume of water do you use in the whole of your factories?—We pump it up by a steam-engine of three-horse power.

1737. What volume of water a day do you use?—It is purely a mere guess; we pump about four times a day for about three quarters of an hour as fast as we can pump, and I suppose we empty the cistern about twice a day.

1738. What is the size of the cistern?—I think we use perhaps 1,000 gallons of water a day.

1739. Does it all become refuse?—No, certainly not, a great part of it passes away as pure as water; the only refuse would be when we are dyeing or bleaching, such as the liquid which is used to cleanse the plait and the liquid which is used to put the bleach on. The wash which passes away from the closets and stables is the refuse, the other passes away, a great part of it, in an impure state and not at all diluted.

1740. What quantity of the 1,000 gallons would be polluted as you have mentioned?—I have no such calculation with me, but perhaps 300 gallons a day passes away, having been used for the purposes of bleaching.

1741. (*Professor Way.*) Is there anything in it that would make it worth your while to extract; is there any value in it?—No, it is not worth the trouble.

1742. Do you use much soap in your manufacture?—Yes, we use a large quantity of soap. You asked what was the colour of the refuse water. When we begin to use it it is very clear, but when they have finished it is not so.

1743. What arrangement in the shape of privy accommodation have you made for your workpeople?—Very bad indeed.

1744. Have you introduced waterclosets?—Yes, at the top of the building, and they are served by pumps. We cannot get the cistern high enough to supply them. We supply the cistern with a force pump and the labour of a man, but unless they are very much looked after there is a great deficiency, and a great nuisance is the result.

1745. You have to manage your own engine, supply your own labour, sink your own well, and do everything?—Yes.

1746. Do you think that the local board could perform that operation better than you would do it yourself?—Yes, very much better, and very much cheaper, and immensely to the advantage of our workpeople. The same remarks apply as to the number of the workpeople and the water, where there is a scanty supply, as applies to the houses where it is very difficult to get at it, and there is no doubt that that is one of the things which we so much need in Luton, where it forms the staple article of our bleaching operations.

1747. If you could be supplied with water as economically as a properly devised water company could supply to you, would you take it from them in preference to sinking for water yourself?—I should consider it one of the greatest advantages that we could have to be able to treat with a company or the local board to-morrow for a full supply of water to our premises at an additional cost of about 20*l.* or 30*l.* a year beyond what we pay now.

1748. And if you could obtain it at half the cost of your present supply it would be all the more satisfactory to you and do no one any harm?—Yes; it is always best to put these cases as strongly as justice will allow them to be put.

1749. (*Mr. Harrison.*) Can you give us any idea of the extent of your own manufacture as compared with the total amount of the straw hat manufacture in the town?—No, I cannot; it would be so very small as compared with the trade of the whole town that it would bear no comparison. Such is the extent of it all over Luton and everywhere.

1750. (*Chairman.*) Have you no idea what number of persons are employed in the straw plait trade, say within 1,000?—No; but there is a very large number of persons so employed, more than half the population; that is the best approximation I can make.

1751. Do you think that the refuse as it passes from your premises, and as it must go from others, containing ingredients like those which you have mentioned, should be carried into the river to pass on to London, and there to be distributed for drinking purposes?—No.

1752. Even after it has undergone the deodorizing process?—I do not care what process it undergoes, it comes from a population of 22,000 inhabitants. There is an immense quantity of logwood and all kinds of acids and other refuse from a town like this, and I say that it never ought to be allowed to pass into any stream, not even into a drain, much less into a small stream like the Lee, which sometimes has not five inches of water in it. Although we do not use it for domestic purposes, perhaps there are parties living within two or three miles of this place who do use it, and it must be, I should think, highly injurious to the health of the people in the neighbourhood.

1753. Are there among the chemical ingredients which are used for dyeing and bleaching certain poisons which remain so although they are diluted?—Yes.

1754. The poisonous character is not destroyed by the dilution?—No.

1755. (*Professor Way.*) I think you stated that dyeing was not carried on in large establishments, but that there were many small ones?—Yes. I should say that our dyeing is perhaps larger than in almost any other house in Luton; but dyeing is carried on by Mr. Leye, Mr. Tierney, and some five or six large dyers. We send it out, but there are many other small makers, such as would use 1,000 or 1,500 score of plait, and dye it at home; for instance, where a man and woman manage their own trade, if they dyed their own plait they might save a sovereign by doing it, and all these things help to make up an income during a week. Therefore there is a great quantity of dyeing done all over Luton, and I think that it exceeds the bleaching considerably, especially for several months in the year. You may have observed places of business in George Street, but scarcely any of them dye. All their goods are dyed at various parts of the town. The plait is bought in its rough state on a Monday, the parties work it up, and bring the hats down to the market to sell them. We keep a large number of hands, and we send our plait off to be dyed; but we do it ourselves for a few weeks in the summer when we have no bleaching going on, just to employ our bleachers.

1756. If it were possible in your manufactory to do anything to purify the refuse before it was sent into the sewers it might not be possible to do so in very many small places?—I think not; it is not as if these operations were confined to particular parts of the town where you could deal with them in bulk.

1757. (*Chairman.*) Where does the plait which you make in Luton go to to be used?—The best plait is not made in the town. Some little is made in the neighbourhood, but most of it is made 10, 15, or 40 miles away from Luton; it is brought here from Dunstable and other places to go through the process of bleaching and dyeing, and then to be manufactured into white or black hats, or white bonnets, or black bonnets. There is a large market here on Monday morning, when we buy the materials that are brought to Luton to be made into the manufactured article.

1758. It is used in England?—The manufactured article is used all over the world; it is sent abroad and goes to every place on the continent of Europe; to the United States, Valparaiso, Chili, Brazil, and everywhere else wherever there are ladies.

1759. Do you know, as a manufacturer, whether the same kind of material is imported from any other part of the world into England?—Yes, we import very large quantities, and so do our neighbours the French, from Saxony and Switzerland, and the Duke of Baden's estates. I mean not the manufactured, but the raw material, the straw.

1760. The plait?—Yes.

1761. Is there any importation of manufactured articles, hats or bonnets, from any part of the world into England?—Very few are imported. Sometimes a few from France and Belgium, but there are more bonnets come from France. From Belgium they are very limited. These are bought in this country more to ascertain the style of the article made in those countries, and when we have got that we can beat them by half the price.

1762. Shall we be right in saying that England is a straw bonnet making country in this part of it?—Quite so, and that it beats all other countries in the world.

1763. What is the youngest age of the children who come into the business?—That question must be divided into two parts; first, as to the age at which we as large manufacturers should be disposed to take them, and, secondly, the age at which large numbers are employed in small houses all over the town.

1764. And all over the county, or the straw plait district?—Yes, that is a very different affair. I should never think of taking a young child. The boys come to us at 10 or 12 years of age, and then we have no objection to take them; but there is no doubt that very large numbers of children are employed at a very tender age in the making of straw hats in various parts of Luton and in the counties adjoining.

1765. At as early an age as the little fingers can do any work?—I should certainly say from eight years upwards.

1766. Is the business at all under Government inspection?—No; for this reason, that the Government seldom interfere but where masters bring large numbers of workpeople together on their premises; they have seldom interfered where a woman having two daughters of her own may choose to engage two or three more persons to work in her own house; that, I think, is one reason why we are not under Government inspection.

1767. Have you any regulation with regard to what are called half timers or scholars?—While I lament that persons so young should be engaged in any manufacture, or in any employment at all, instead of their youthful days being devoted to education and to those advantages which they can only have in early life, I do not think that this employment is injurious to their health, because they are allowed to go out very frequently and to walk about; they are not in heated rooms; they would suffer considerably more in rooms of that character, where large numbers are brought together, than they do in those houses. I express my regret that they are employed at all, but in justice to the parties who do employ them, I am bound to say that I think that considering the pure air which they get in going to and fro and often running about the yards, the employment is not so injurious as if they were brought in large numbers into one building.

1768. I assume that the making of straw plaits is, during a considerable portion of the year, carried on even by the children in the open air?—It is.

1769. And therefore they breathe the fresh air?—Yes, and I do not think that it is so injurious to their health as we should suppose at first sight. My objection is that which I have stated.

1770. Therefore they do not come under the same range of objections as factory children confined from early infancy within the four walls of a building?—No. I must make one more observation, namely, that there is a great alteration as to the time for which the people work here. In the large manufacturing districts there are fixed hours; persons must be there from 6 o'clock to 6 o'clock, and another party comes on and remains till the others return; the way in which the business is conducted here is, our young people come at 9 or half-past 9 or 10 o'clock, and they go away at a quarter to 12, stay away two hours, go to and fro, except on particular occasions, and do as they please.

LUTON.

Mr. W. Willis.

12 Dec. 1866.

1771. (*Mr. Harrison.*) It is all piece work?—It is all piece work.

1772. And there is no machinery standing?—No; and there is none of the noise made by clogs which there is in the north of England.

1773. I presume that in the manufacture of plait there is some advantage in early teaching?—There is an advantage, but we must not purchase any advantage at the expense of one's whole life afterwards.

1774. (*Professor Way.*) Perhaps it is an advantage to the proprietor rather than to the people?—Yes; it is not an advantage to the younger children. You will find within four or five miles of this place that which I think is more injurious, namely, 18 or 20 young children brought into a woman's house, and in a very small room, where the cooking and so on is going on, and she perhaps gets 2*d.* a week for each of those children from their mothers, and extracts from them a certain quantity of plait every day. I think that the plaiting children suffer considerably more than the children do who are employed in various parts of the town in making up the hats.

1775. (*Mr. Harrison.*) Instead of being educated they are at work?—Yes, and that is my great objection. At the same time I cannot but think that it is highly injurious to bring 20 little children into the first floor of a small cottage, and for them to sit there until 9 o'clock in the evening, at the tender ages of eight to 11, making a certain quantity of plait. If we had Government inspection in this neighbourhood I think that the plaiters would need it more than the straw hat makers.

1776. (*Chairman.*) I gather from your remark relative to the clogs in the north that you have heard them?—Yes; they wear thin shoes here, slippers and all sorts of things.

1777. (*Mr. Harrison.*) You have given us a description of the materials which you use, you have also stated the number of people whom you employ in your manufacture, and the volume of water which you use; can you give us the weights of those different materials which you use per annum in bleaching?—I can do it, and will enclose it to the Commissioners.

1778. With respect to Dunstable I wish to ask you a question?—We have a factory there.

1779. Is the manufacture there of a similiar character to that at Luton?—No, it is altogether different.

1780. What is the difference?—There it is principally, if not wholly, confined to manufacturers, and it is not carried on, as it is here, to a very large extent by small makers.

1781. Is the straw there bleached and dyed in the same way as it is at Luton?—Yes, if it is bleached and dyed at all, but large quantities are dyed here and taken to Dunstable and various other parts; bleaching and dyeing is carried on to a very limited extent in the town of Dunstable.

1782. Dunstable is not so happily situated as Luton for a good supply of water or for getting rid of the refuse which you mention as the result of the manufacture at Luton?—We are bad, but they are worse.

1783. (*Chairman.*) With regard to Hitchin, what branch of the business is carried on there?—We have a small factory there of 50 hands, and there may be a few besides; there are, perhaps, not more than 100 hands in the whole place; therefore it is what we should call a large market town, situated in an agricultural district; it is a very large straw plait market in the raw material. I am speaking now so far as the conversion of that straw plait into the manufactured article is concerned.

1784. Where is the straw principally grown?—Throughout the counties of Hertfordshire and Bedfordshire, some in Buckinghamshire, and immense quantities in the counties of Essex and Suffolk.

1785. What is the straw?—It is the wheat straw; it is much superior in this part to any other, and although an immense quantity is used in the county of Essex, immense quantities of that straw are sent down there for the plaiters to use, because it is of a softer kind. I know not what is the cause, but the neighbourhood of Tring, Biggleswade, and the county of Berks are very excellent districts for the wheat straw, which in times of scarcity is brought here.

1786. (*Mr. Harrison.*) Is it generally grown upon the chalk formation?—Yes. Biggleswade and this county is a very excellent neighbourhood for straw.

1787. (*Chairman.*) Is the straw which is purposed to be used for plait reaped in the same way as ordinary wheat, or with more care?—If a farmer has a small quantity where he thinks the straw is very superior, it is to his interest to be very careful in cutting it; we do not like straw which has been mown; it should be reaped, and if reaped it may be reaped in the usual way, and then it goes into a machine. Persons come and buy a stack of wheat and give the farmer money, according to its value, for the stack of wheat; that is taken into a machine; the parties there are cautious to draw the straw out and they put it up into small bundles; they cut off the ear, bringing the other part away.

1788. The wheat is not thrashed as ordinary wheat upon the floor or in a thrashing machine?—No.

1789. But the ear is cut off?—Yes; if you buy 1 or 2 cwt. it is all weighed together, and you leave the wheat behind and any refuse; if the straw was at all broken it would not be at all suitable for making straw plait.

1790. (*Professor Way.*) Is not that the way in which the harvest is reaped in America?—I have so little knowledge of that democratic country that I cannot speak as to that.

1791. (*Chairman.*) Do you know of your own knowledge whether the straw of wheat which has been grown under good and improved cultivation is better in quality for your straw plait than neglected or poor wheat?—The neglected wheat is better for our straw because it is finer; if the cultivation is too much improved, and the crop is too heavy, the straw is too coarse for us, and therefore we get the light straw from the poorest parts, and sometimes from the poorest farmers.

1792. (*Mr. Harrison.*) I think that the character of the chalk straw would generally be short, fine, and white, which are your essentials?—Yes.

1793. (*Chairman.*) In your opinion would the straw of Russia, or of the great wheat-bearing districts of the continent, from which we mostly get our corn, be equally available if sorted for your purposes?—No plait is made in Russia, and therefore I cannot speak to that; but you get straw in Belgium quite equal to our own, and some kinds of straw in Switzerland quite equal to our own, and in Saxony also.

1794. And in Spain?—I know very little of that country.

1795. Did you ever see any Australian wheat or Australian straw?—I have not seen Australian straw I have seen Australian wheat.

1796. Of course it would not be worth while to import straw from Australia?—No, it would not pay if you gave it to us. When our trade is brisk the beauty of it is that it is all labour. If I showed you a lady's bonnet, worth 7*s.* or 8*s.*, the straw in a farmer's yard would not be worth a penny, and therefore all that is labour.

1797. (*Mr. Harrison.*) There is labour and profit?—Yes.

1798. Is the Leghorn straw plait made from wheat straw?—I suppose that it would be a wheat straw, but it is differently prepared, which gives it a different colour.

1799. Are Luton and Dunstable the centres of the straw manufacture?—Luton and Dunstable are the emporium of the manufacture of straw hats and bonnets.

1800. What is the extent of country over which the manufacture of straw spreads?—About a radius of 25 miles round Luton I should think would be engaged in the manufacture of straw plait and straw goods.

1801. (*Chairman.*) Have you any idea what would be the gross sum, within a few thousands per annum, which is turned over in this straw plait trade?—No; it is more than 1,000,000*l.* per annum. There are single houses which do more than 100,000*l.*

1802. Then it is a very important trade for this part of the country?—I think so. If I said 2,000,000*l.* I should not have any doubt about it, but I should not like to say, because when persons speak with that minuteness they are apt to form their judgment in detail and pass their criticisms upon men who know more about the matter than themselves.

1803. But you think that the gross sums dealt with may be taken at from 1,000,000*l.* to 2,000,000*l.*?—Yes.

1804. Is it an increasing or a decreasing trade?—A largely increasing one. You may fairly take it for granted without any mistake that the amount is between 1,000,000*l.* and 2,000,000*l.*, and, in the opinion of a gentleman who has just spoken to me, considerably nearer the latter than the former.

1805. (*Mr. Harrison.*) Can you give any idea of the total weight of straw which is used in the manufacture?—No, I could not approximate it at all.

1806. (*Chairman.*) Is there anything you wish to add?—No.

The witness withdrew.

Mr. John Cumberland (Luton) examined.

1807. (*Chairman.*) You are a land surveyor?—Yes.

1808. Were you at any time surveyor to the local board of health?—I was surveyor on its first introduction into the town about 16 years ago. I was surveyor to it for five years.

1808*a*. Had you anything to do with devising the system of sewers?—Yes, I laid out several new sewers.

1809. When you were first surveyor?—Yes.

1810. In what condition did you find the town upon your appointment as regarded sewerage and drainage?—The whole of the new streets were entirely without sewers. There was an old sewer down George Street and Park Street.

1811. Of what shape in section were the old sewers?—They were near the surface of the ground, and they were 12-inch sewers, except the one in George Street, which was 15 inches.

1812. Were they square on section, or circular?—Circular.

1813. Were they made of brick?—Yes.

1814. I suppose that they had been made by the highway surveyors for carrying away the surface water?—Yes.

1815. Did they at that time drain any of the houses?—Yes, the surface water, but not the cellars or underground kitchens.

1816. Were the contents of any waterclosets at that time turned into those old drains?—There might be a few, but I think not 20 in the town.

1817. Where did the old drains empty?—Into the river Lee or into the ditches which went into it.

1818. How long have you known the Lee?—25 years well, and longer.

1819. Do you know where it rises?—I think that I know every point of it.

1820. Does it rise principally in springs?—Yes, in a series of springs at Leagrave Marsh.

1821. Have those springs been at all interfered with within your knowledge by any parties?—Yes.

1822. Who has interfered with them?—The farmers from time to time have filled in the springs as they ran into the land and interfered with cultivation; they have filled them up and then ploughed over them.

1823. They would not stop the water by filling them up?—They would divert it.

1824. When a spring goes into daylight, if they filled it up it would go out of daylight?—Yes.

1825. Have you seen any land irrigation anywhere?—No, not sewage irrigation.

1826. Have you seen any water irrigation?—Yes; I was on Lord Dacre's estate as a pupil.

1827. From your knowledge of water meadows do you think that a beneficial effect might be produced by sewage irrigation?—Certainly.

1828. What weight of grass were you enabled to get from your water meadows?—I cannot say, because the land was always fed with sheep.

1829. It was considered advantageous?—Very advantageous.

1830. That was pure spring water?—Pure river water, the water of the river Mimram.

1831. In what district is that irrigation carried out?—About seven miles from here.

1832. Below or above?—It is in Hertfordshire.

1833. Is it down the river Lee below Luton or above?—It is on the river Nene, which falls into the river Lee at Hertford.

1834. What is the subsoil, is it chalk or lime?—Gravel; and not chalk.

1835. That is the land which you irrigated?—Yes.

1836. What did it cost per acre to lay out that land for irrigation?—I cannot say; it was done before I went there.

1837. Had it been a costly affair?—No; it was done by a series of side cuts and side drains falling one into the other; it was very simple.

1838. Do you think that you could readily with a plough lay out irrigating grips by contour lines so as to irrigate land in a similar way?—I have no doubt that arable land could be done so at very little cost.

1839. (*Mr. Harrison.*) Was there any difficulty in getting the water to pass over that character of soil?—No; it was blocked up and run out of the main river on to the beds, and it then flowed into the river again lower down.

1840. There was no difficulty from its soaking into ths soil too rapidly?—No.

1841. (*Chairman.*) What is the general character of the soil of the valley of the Lee?—Chiefly chalk; there is a little bit of gravel first of all, a kind of silt, and then you get into the chalk; but lower down beyond here I should say that you get into very boggy peaty land, that is in the lower valley close to the river, but as soon as you get away from it you are in chalk.

1842. I think that there is a new railway being made up here?—Yes.

1843. And that shows you that the soil is chalk for several miles?—Yes.

LUTON.

Mr. J. Cumberland.

12 Dec. 1866.

1844. The excavations are chalk, and of course the embankments are chalk?—Yes; I should say that in the cutting at Chalton Cross, just at the source of the Lee, they are tapping springs, and they are in water the whole time; the Midland Company are about 55 feet deep in cutting and they have been flooded with water the whole time, and are now; I was there on Saturday.

1845. (*Mr. Harrison.*) Is that cutting at a considerable elevation, considerably above Luton?—Yes; it is gradually rising the whole way.

1846. How many miles distant is that cutting?—About $3\frac{1}{2}$ or 4 miles.

1847. Would that volume of water which has been passing from the sides of the cutting afford a good water supply for the town of Luton?—Not at all, but it would certainly aid it very much.

1848. You have said that you carried out the sewerage works of Luton?—Yes, the earlier part of them.

1849. Did you find any difficulty in any part of the town in executing those works efficiently in consequence of the springs of water which came into your works?—No; we never got into the lower level.

1850. In the works which you did carry out did you tap springs to any extent?—Never to any extent.

1851. How many miles of main sewers were executed under your inspection?—I think probably not above a mile or a mile and a half.

1852. (*Professor Way.*) What is the usual value of land in this district for general agricultural purposes?—From 30*s.* to 2*l.* per acre.

1853. It is not a good wheat district, is it?—I think very good.

1854. You think it very fair?—Very fair.

1855. Then what has caused the straw plait, which requires an inferior wheat although a superior straw, to locate itself here?—A high state of farming has driven the straw trade into an inferior farming district.

1856. In the north we have heard that the manufacturers have gone to certain districts for pure water for dyeing and cleansing purposes; what do you imagine originally caused the straw plaiting business to settle itself in this district?—The quality of the wheat straw unquestionably.

1857. And that, we have been told, is not a fine quality of straw agriculturally?—Not agriculturally.

1858. Then is the land about here under the average of good fair land?—No; I should think that it is a very fair average, taking the country through.

1859. Straw fit for plaiting is only, I suppose, to be found on certain soils?—Yes, the best quality of straw, namely the softer quality of straw is on the green sand formation.

1860. If you found that on a particular farm a large quantity of straw was bought for straw plaiting purposes, would you suppose that that land would sell for more or for less than other land in the neighbourhood?—It would not affect the value of it in selling at all.

1861. We have been told that the poorest wheat gives the best straw?—That is quite correct. If you go to Totternhoe, the next parish to Dunstable, where they grow the best straw, it is open land, and they grow more straw than wheat, but it is a risk; if a shower of rain comes it is spoilt unless they do it at the right moment, but it answers the purpose where your farming is not up to the mark, and if they can get the straw they cut it very early; they sacrifice the wheat in order to get the straw.

1862. (*Mr. Harrison.*) In the case of the irrigation which you mentioned just now did the water issue from the green sand?—No, it came from pure chalk, the white wells, near Whitwell, Herts.

1863. (*Professor Way.*) Do you know whether any coprolites are got in this neighbourhood for manure?—Not nearer than Hexton, about seven or eight miles from here, over the hills; they are working them there very largely; they restore the land.

1864. Are they at any depth under the soil?—About seven feet. This specimen of a shell which I now produce came from Shillington.

1865. (*Chairman.*) Have you many of this form of shell?—Yes, a good many of them, not so perfect as that; I picked that out as being perfect.

1866. (*Mr. Harrison.*) Do you know whether the water issuing from the formation in that district is used for irrigation to any great extent?—Not at all, I think.

1867. Are you aware that it is very valuable for irrigation?—I was not aware of it.

1868. The beautiful water meadows of Dorsetshire and that neighbourhood derive a great deal of their superior quality from the water issuing from the green sand formation?—I was not aware of it; I do not think that it is used at all here; I am not aware of any case in the neighbourhood where we irrigate.

1869. (*Chairman.*) Is there anything further you wish to add?—No.

The witness withdrew.

Mr. C. Maffey.

Mr. Charles Maffey (Luton) examined.

1870. (*Chairman.*) You are the local registrar?—Yes.

1871. And you are sanitary inspector under the local board?—For the board of guardians in the hamlet, not in the township of Luton.

1872. Can you furnish the Commission with the local death rate for any period?—In the year 1864, in a very dry summer, we had a great excess of deaths.

1873. Could you extract from your books the mortality for the last five or six years?—I could.

1874. Could you give it to us for seven years before the board came into operation?—Yes.

1875. From 1845 to 1852?—Yes.

1876. And then from 1858 to the present time?—Yes.

1877. About what would be the cost of doing that?—It would be very trifling.

1878. I think that it would be best if we could get it from 1847 down to the present time. What has been the death rate per 1,000 for the last 12 months?—I should think that taking the 12 months it is 25, but in the dry summer which we had a year or two ago the mortality was greater on account of their being a short supply of water.

1879. What was it then?—I should think 35 per 1,000.

1880. Could you give us the death rate of different parts of the town?—I do not see very well how I could do that.

1881. In your experience is not the death rate in the poorer parts of the town, at a very much higher amount than the death rate in the better parts of the town?—Yes.

1882. If you have 10 in the 1,000 or 12 in the 1,000 in the better parts of the town, you may have 40, 50, or 60 per 1,000 in the poorer parts of the town, taking population and death rate?—There is no doubt of it; it is considerably greater.

1883. Therefore, when you sum it up all together, in a population of 20,000 it gives you a very poor idea of

what one part may be suffering as compared with another?—Yes.

1884. What was your worst year?—The year of the dry summer, which I think was 1864.

1885. If you will give us the part of the town where it occurred it will be of real use?—We can do that.

1886. (*Mr. Harrison.*) Are you the registrar of any country district as well as of the town?—Yes, I am registrar for this union.

1887. Could you give the death rate in some of the outlying agricultural parts of the district?—I think that I could give it to you from parishes in my district; my district comprises five other parishes besides Luton.

1888. Do you find a very great difference in the death rate of some of those outlying parishes as compared with the town of Luton?—No.

1889. (*Chairman.*) But a death rate of 35 in the 1,000 must have been frightful?—Yes, but that only occurred, I think, in one dry summer. In 1864 and at the beginning of 1865 the water was very insufficient.

1890. Will you add to the return which you are about to give us the death rate of some of the outlying parishes?—I will.

1891. (*Mr. Harrison.*) How are the outlying districts supplied with water?—At Stopsley, which is two miles from here, I do not think there is more than one well in the hamlet, and they got their supply of water from the clay pits and the ponds till at last the water was completely gone, and they were obliged to have their water from the river Lee.

1892. The water which they had was water collected from the surface into ponds?—Yes.

1893. Was there much vegetable growth in those ponds during the dry seasons?—Yes.

1894. Could other pollutions get into those ponds?—Yes, all the refuse from the roads and everything.

1895. Was the condition of those ponds, while the inhabitants were drinking the water, very bad?—Yes.

1896. Was the effect upon the health of the people who were drinking that water marked?—Yes; we had more deaths in that hamlet at the time when the water was bad and short.

1897. Do some of the villages obtain their water from wells?—Yes.

1898. Have they an abundant supply of it?—Yes, I never heard of the water failing in the villages about, but only in the hamlet of Stopsley, which lies on a hill and where they have no wells.

1899. Are those wells in the chalk?—Yes, all but Barton, and that is on the clay.

1900. Do you find much difference in the health of the inhabitants in those parts as compared with the others?—They have been more healthy and are so at the present time; the water has been superabundant.

1901. Will you let the returns which you give be of two parishes, one of which is situated in a chalk district with an abundant supply of water and the other a parish which is dependent for its supply of water upon the rain water collected in ponds, as you mentioned in the first instance?—Yes.

1902. You are inspector of nuisances?—Yes, for the hamlet.

1903. Not for the town?—Not for the town.

1904. You are appointed under the board of guardians?—Yes.

1905. How long have you been appointed?—I have been inspector of nuisances for many years.

1906. Have you found in the country districts occasions to call upon people to remove nuisances?—A great many.

1907. What has been the character of those nuisances?—The overflowing of waterclosets and bad drainage and so on. There was no sewerage to take it away, and the sewage soaked into the ground.

1908. Have you found any difficulty in obtaining the removal of those nuisances?—I have in some cases; I have summoned several parties before the magistrates.

1909. What system have you found in the country districts the best to adopt so as entirely to remove all occasion for complaint?—The only thing which I can find in the country districts is to have a privy, and to have it properly cemented to keep out the water, and properly covered in.

1910. And to have the refuse frequently removed?—Yes.

1911. Is it generally applied to the land?—Yes.

1912. Have you found any nuisances arising from the refuse from the farmyards?—No.

1913. You have not had any occasion to complain of that?—No.

1914. Have you found pigstyes kept by the cottagers?—Yes, and I have had them removed 20 or 30 yards from the houses.

1915. Have you found much opposition on the part of the occupiers?—No. I leave the proper notice, and it is done within the time, and if not I have been obliged in a case or two to summon them, but that is not a common occurrence. Brown Brick is the worst place which I have in my district.

1916. Is that towards the south-east part of the town?—Yes.

1917. Just outside the jurisdiction of the local board?—Yes.

1918. Did you hear Dr. Tomson's evidence?—I did.

1919. Do you corroborate it?—I do. A great deal of refuse lately has been thrown direct into the river Lee; it does not go into the deodorizing works. There have been many cases in the last few years of little bleachers and dyers, who have no drainage to take away the refuse, throw it down on the surface, and it is washed into the river.

1920. How did that locality happen to be without the district of the local board?—I do not know.

(*Mr. Pledge.*) That land has recently been sold for building land and a great population has grown up there, but it is outside the township.

1921. (*To Mr. Maffey.*) Is that a part of the town which has been recently drawn upon?—Yes; and I have seen two or three wells, the water of which was not fit to drink, and I have ordered them to be cleaned out; in fact there were places where a dumb well and a well of water were within a short distance of each other; I have had the dumb well filled up.

1922. Dr. Tomson said that there was evidently sickness arising from that state of things in that locality?—Yes.

1923. Is that likely to spread into the town of Luton?—Yes, it being so near.

1924. (*Professor Way.*) Those dumb wells are cesspools?—Yes.

1925. In what soil are they?—Chalk.

1926. Is any attempt made to prevent their leaking?—No; they make them here on the chalk so that the matter may sink away.

1927. Then what chance have the wells?—It drains through the chalk. What is called Brown Brick is not all chalk, it goes through the chalk and the gravel.

1928. They are never emptied?—No.

1929. It must go somewhere?—Yes, and it runs into the drains, and many of them go into the river; in fact drains have been laid from them into the road.

1930. Although the sewage of a house may not go into the river by the regular authorized drains it may get there sooner or later through the chalk?—It cannot help itself.

The witness withdrew.

LUTON.

Mr. W. H. Higgins.

12 Dec. 1866.

Mr. W. H. HIGGINS (Luton) examined.

1931. (*Chairman.*) What are you?—A plait merchant.

1932. Where are your works situate?—In George Street.

1933. What number of hands do you employ?—I am a dealer in the raw material.

1934. What quantity of materials in value passes through your hands in the 12 months as a dealer?—It is a difficult matter for me to tell you exactly; there are so many things which we deal in besides the raw material that I could not tell you, the raw material would be one particular branch.

1935. Did you hear Mr. Willis give his evidence, who stated that the whole amount of straw plait weight come to nearly two millions?—I have not the least doubt that it would exceed a million.

1936. And that this district is the greatest straw plait place in the world?—Yes, and this town has the greatest amount of straw plait.

1937. This town of Luton is the centre of that district?—It is.

1938. And it has the largest dealings in it?—By far.

1939. Are there any special points in this inquiry to which you wish to speak?—I wanted to put one question to you, you have been told that a private company has been formed to erect waterworks in this neighbourhood.

1940. Or has been spoken of?—Yes, that is two years since; they have done nothing yet. I wanted to know whether that would be a legal obstacle in our way as a board in erecting waterworks ourselves, as the company have done nothing?

1941. It would not, but if you allowed a company to occupy the ground, and to acquire legal rights of any kind, it would then be very difficult for you as a local board to get past them without purchasing them out.—They have not purchased any land at present, I believe.

1941*a*. (*Professor Way.*) Have they an Act?—Yes, they have obtained an Act.

1942. (*Mr. Harrison.*) What is the period within which they must execute their works?—Seven years, of which two years have gone.

1943. (*Chairman.*) I do not think that the Secretary of State would allow them to stop you if you put the case fairly to him. You as a local board would have to make application through the Local Government Act Office to the Secretary of State for Home Affairs, to be allowed to raise the money for your waterworks, and you would have to devise waterworks. Was this company going to sink a well?—Yes.

1944. Then I have no hesitation in saying that, under those conditions, the Secretary of State would not stop you, and I speak as the principal inspector of the Local Government Act Office. Very probably the question would have to be submitted to myself.—I am obliged to you. There is another question. You have heard of the state of the hamlet, which has formed part of the town although not in the township, and which is not under the board of health; would there be any difficulty in getting that hamlet under the management of the board of health?

1945. None whatever.—It is a great nuisance to us as a board.

1946. Your clerk ought to have been able to acquaint you with what the proper process would be. You would have to petition the Secretary of State to be allowed to extend your boundary, and if the Secretary of State, upon a report laid before him, approved of it, that extension would be made by a provisional order, at no cost to yourselves excepting it was opposed in Parliament?—I am obliged to you.

The witness withdrew.

Mr. T. Taylor.

Mr. THOMAS TAYLOR (Luton) examined.

1947. (*Mr. Harrison.*) You are bailiff to Mr. Crawley?—I am his agent.

1948. Where are Mr. Crawley's estates situated?—They are situated on the north side of the town of Luton, on both sides of the river Lee, extending for a mile and a half or two miles.

1949. Is that part of the river Lee at all subject to be flooded?—Very often.

1950. Has that flooding increased of late years?—I cannot say that it has, but there is an impediment which we consider might be removed. Formerly there was a mill on the north side of the town but now it is pulled down, and in the construction of the Midland railway they have put in a weir to keep up the water to its old driving height, which we consider is not of use to anyone. Formerly it was obliged to be at that height for the purposes of the mill, but now it is not required.

1951. Did the Midland Railway Company purchase the mill property?—Yes.

1952. Then with the mill they purchased the right of maintaining the dam?—I cannot say that.

1953. Would they not have to purchase the power of the mill when they purchased the mill, and the power could not be maintained without the dam, and therefore they would purchase the right to maintain the dam which the miller had before?—We consider that it overflows now perhaps rather more than it did before; for this reason, formerly when they found a flood coming on they could pull up their floodgate, but now they have none, and we consider that it floods our land six inches more than it did formerly.

1954. Have the Midland Railway Company done away with the mill?—Yes.

1955. (*Chairman.*) It is a common law right. We can listen to what you say, but I do not think that we can afford you any remedy?—By having this weir put in the water runs six inches deeper, and it floods the land all over its banks.

1956. (*Mr. Harrison.*) But you have said that the land is not flooded more than it used to be?—It is said that the amount is the same, but we consider that the land must be more flooded.

1957. (*Chairman.*) As I understand you, this is the fact which you wish to put before this Commission, that the Midland Railway Company have possessed themselves of a mill?—Yes.

1958. And have removed the wheel?—Yes.

1959. And have removed the mill?—Yes.

1960. They maintain the dam at the original height?—Yes, at the driving height.

1961. But they have put in no bye-sluices to enable them to draw down that water in time of flood?—Not at all.

1962. The miller had bye-sluices which he could draw, and did draw, in time of flood?—Exactly so.

1963. Therefore you may in flood time be more flooded than when the miller had possession, because there is no bye-sluice to be put in operation?—Just so.

1964. That is what you complain of?—Yes.

1965. (*Mr. Harrison.*) Have they lengthened the weir at all?—I should say not. The stream which leads up to the weir is narrower than the former bed of the river; it is about half the length of the former river. Formerly there used to be a large mill-head.

1966. (*Chairman.*) I suppose that you are not a solicitor?—No.

1967. But there is a solicitor belonging to the estate?—Yes.

1968. (*Mr. Harrison.*) Have the company erected a bridge above the weir across the Lee?—No, not across the Lee.

The witness withdrew.

Mr. Thomas Lye (Luton) examined.

1969. (*Chairman.*) What business do you carry on?—Dyer and bleacher of straw plait.

1970. Where are your works situate?—In New Bedford Road.

1971. What number of hands do you employ?—About 30; it varies.

1972. You dye straw plait?—Yes.

1973. Have you any idea what quantity you dye each year?—I have not kept any account of it.

1974. Do you know what weight of material you use in dyeing?—Yes; logwood is one of the chief things which we use in dyeing in this trade, because black is the prevailing colour.

1975. Is it chip or ground logwood?—Chip.

1976. What weight of logwood do you use?—I daresay that I use nearly 25 tons in the year.

1977. What becomes of the chip?—We burn it among our refuse.

1978. You do not send it down the sewers?—No, it is burnt.

1979. Do you use engine power?—No.

1980. What other material do you use?—There is a yellow wood called fustic, which we use in a smaller quantity.

1981. Do you use it in the chip?—Yes.

1982. Do you also burn that?—Yes.

1983. (*Mr. Harrison.*) What is the weight of that?—About two tons.

1984. (*Chairman.*) What other material do you use?—I use a few hundredweight of camwood; camwood is a perfectly red wood.

1985. Is it not red and yellow mixed?—There is an amount of yellow in it, but the main portion of it is red; it is called a red wood.

1986. It would be something like logwood?—It would be a deeper red. We also use madder; I should say four hundredweight.

1987. What else do you use?—I use copperas—that is sulphate of iron; I should think four tons in the year.

1988. Do you use sulphur?—I use it in the bleaching, but that has nothing to do with the dyeing, nor does it go down the sewer, as it is used in a gaseous state; I also use about two hundredweight of sulphate of copper per annum; and sulphate of indigo, perhaps five hundredweight per annum.

1989. (*Professor Way.*) What is it worth?—It is a sort which would be worth 1*s.* 6*d.* per lb.; there are different prices. We use four hundredweight of Cudbeer's article; also oil of vitriol.

1990. (*Chairman.*) How much oil of vitriol do you use?—Four or five hundredweight per annum.

1991. (*Professor Way.*) Do you dye anything but blue and black?—I dye various colours.

1992. What other colours do you dye?—Brown and different shades of drab.

1993. Do you use any of the fancy colours in aniline?—Yes, we use a small quantity of that; there are a number of little articles.

1994. Like this (*showing a specimen*)?—Yes; you would get this from the aniline dyes, but very little of the fancy colours is used in this trade.

1995. Do you use crimson or scarlet?—Yes, but the prevailing colour is black, a small quantity of brown, and a very small quantity of the others; we also use bleaching articles.

1996. (*Chairman.*) What are they?—Oxalic acid and salts of tartar. I do not do any large quantity of bleaching.

1997. About what weight of oxalic acid do you use?—About five hundredweight.

1998. Is it not a deadly poison?—We use carbonate of potash, and where a great quantity is used it neutralises it.

1999. (*Professor Way.*) But it makes the liquid into a poisonous salt?—We weaken it very much in the process by dipping the plait in it; we also use a small quantity of sorrel.

2000. (*Chairman.*) Have any accidents occurred upon the works from these poisons?—None whatever.

2001. What numbers of scores of plait do you treat in the year?—From 15,000 scores a week; perhaps 20,000.

2002. From 15,000 to 20,000?—Yes.

2003. A score being 20 yards?—Yes.

2004. (*Professor Way.*) Are there a great many sizes of plait?—Yes, there is a great variety; some very broad and some narrow.

2005. (*Chairman.*) They are all taken one with the other?—Yes.

2006. (*Mr. Harrison.*) What quantity of water do you use in dyeing that amount of plait?—2,000 gallons per day; I use a large quantity of water for it in the various processes, in rinsing and otherwise.

2007. (*Chairman.*) What quantity of that becomes liquid refuse passing into the drains?—There would be one-fourth lost at all events; you may say that 1,500 gallons pass into the drains.

2008. Which are contaminated with the dye refuse and the acids and the different ingredients?—Yes.

2009. Have you any difficulty in obtaining as much pure water as you require for your business?—None whatever.

2010. How do you get it?—Out of a well.

2011. By pumping it?—By pumping it.

2012. Do you pump it by hand labour, or by steam power?—By hand labour.

2013. Have you any idea of what it costs you a week to pump it?—I should say that 10*s.* a week would do the labour of it.

2014. If you could get as good a supply from the local board or from a company at anything like that cost, would you be a customer of theirs?—I do not think that I could get the large quantity I want in any other way so cheaply.

2015. (*Mr. Harrison.*) It would be 10*d.* for 1,000 gallons?—My men instead of standing idle pump the water, so that it costs me nothing except keeping the pumps in repair.

2016. (*Chairman.*) Have you any idea what proportion of dyeing you do, compared with the whole trade?—I do not know.

2017. Do you think that there is ten times as much as you do?—I think not; I do a great deal of it.

2018. (*Professor Way.*) Are you including the individuals who dye in their own houses?—Yes.

2019. Do you mean to say that there is not more than the labour of 120 to 150 people engaged in the dyeing and bleaching?—There may be more; I will not be sure, but I should not think that there is. Individuals do it at odd times.

2020. (*Chairman.*) Is there anything else which you wish to add?—No.

The witness withdrew.

LUTON.

Mr. Frederick Davis (Luton) examined.

Mr. F. Davis.

12 Dec. 1866.

2021. (*Mr. Harrison.*) You are a member of the local board of Luton?—Yes.

2022. Can you give us information as to the population of Luton?—I will give you the census in 1851.

2023. Can you give it to us in 1841?—I could if I had my books. I cannot give it from memory. I can remember the time when the population was 4,000.

2024. How long can you remember the town of Luton?—50 years.

2025. In what year was the population not more than 4,000?—In 1821 the population of the township was only 2,986, In 1841 it had increased to 5,827.

2026. You have written a history of Luton?—Yes.

2027. Can you put it in?—I can bring it down to you.

2028. What was the population of Luton in 1851?—I only speak of the township; 10,648.

2029. What was the population of the township of Luton in 1861?—15,329.

2030. Has the population increased rapidly since 1861?—I have taken the number of houses which have passed the board of health from the last census, up to last Christmas, and the average has been about 200 houses per annum, and the average inmates to each house at the time of the last census were between 5 and $5\frac{1}{2}$, so that taking the same basis of calculation of 200 houses the population has increased about 1,000 a year.

2031. What population would that give at the present time?—About 5,000 more.

2032. That would be upwards of 20,000 at the present time?—Yes; we consider that the population would now be about 20,000, but then we must take into consideration a place which has already been referred to, namely West Hyde, which has been complained of by the medical men; it has been called Brown Brick; it has grown up in the last three years, and there is a population there of 1,000, and although it is not properly in the township of Luton it still forms a part of Luton.

2033. (*Chairman.*) And it torments Luton by breeding disease?—Perhaps it does; but still it fairly, I think, belongs to the population of Luton.

2034. (*Mr. Harrison.*) What is this considerable increase in the number of people in Luton resulting from?—From importation a great deal.

2035. Is it to carry on manufactures in Luton?—Entirely.

2036. What manufactures?—The manufacture of straw hats and bonnets.

2037. (*Chairman.*) Then the births are not increasing at that rate?—No, we import young women from a distance, some marry and settle down, and some do not.

2038. (*Mr. Harrison.*) Is that rapid increase of population any index of the probable increase of pollution arising from the town of Luton?—I do not think that there is so much pollution in the town now as there was when there was the small population of 4,000.

2039. How do you account for that?—Entirely from the sanitary measures of the board of health.

2040. That is in the town itself, but I mean as affecting the river Lee?—I think that the river Lee must be clearer now than it once was, because all the sewage formerly ran into the river Lee, but we are now restrained by an injunction from the Court of Chancery causing or permitting that pollution.

2041. Is the increase of population an index of the increase in the quantity of sewage matter which reaches your sewage works?—I hardly understand that question; what has it connexion with?

2042. With the dyeworks and the other manufactories in the town.—If the main sewer is complete all the refuse runs down into the works, and it does not affect the wells at all, supposing that it does not escape from the sewers.

2043. All the people who are brought to Luton to carry on manufactures, and who are employed in dyeing and bleaching goops tend to increase the pollution of the matter passing from your sewer?—I think that the importation is more for the manufacture of the article.

2044. Rather than for the dyeing purposes?—Yes.

2045. (*Professor Way.*) A small power in the shape of dyeing and bleaching, I suppose, will suffice for a large quantity of water?—Yes, many families do all their own dyeing.

2046. (*Chairman.*) Have you anything further to add.?—I think not.

The witness withdrew.

Adjourned to Friday next at 10 o'clock, at Bishop Stortford.

Bishop Stortford, Friday, 14th December 1866.

Present:

ROBERT RAWLINSON, Esq., C.B., in the Chair.

John Thornhill Harrison, Esq. | Professor John Thomas Way.

BISHOP STORTFORD.

Mr. John Dobede Taylor (Bishop Stortford), examined.

Mr. J. D. Taylor.

14 Dec. 1866.

2047. (*Mr. Harrison.*) You are clerk to the board of guardians?—Yes.

2048. How many parishes are included in the union?—Twenty, containing a population of 20,000.

2049. Is the town of Bishop Stortford included in that union?—Yes.

2050. What is the population of Bishop Stortford?—A little over 5,000.

2051. Is it an increasing population?—No, not of late years. During the last 10 years it may have increased to the extent of 500 or 1,000; it was 4,000 and odd for some years, but it is not increasing now.

2052. What is the area of the union?—Over 19,000 acres.

2053. Does it lie chiefly in the valley of the Stort?—No.

2054. How far does the union extend?—The valley of the Stort runs to Sawbridgeworth, which is included within our union; it is four or five miles away.

2055. Are there any other places besides Sawbridgeworth included in the union?—There are 20 parishes altogether; the largest are Bishop Stortford and Sawbridgeworth and Stanstead in Essex.

2056. Is Stanstead within the valley of the Stort?—No; the Stort is an artificial canal beginning here, but there are some small streams which contribute to it and that run from Stanstead.

2057. What is the population of Sawbridgeworth?—Nearly 3,000; it is a very large parish and it is very much scattered.

2058. Besides the town of Bishop Stortford the population is chiefly agricultural, is it not?—Yes, the population of the union.

2059. Is there any other authority in the town of Bishop Stortford besides the board of guardians?—Yes, we have a highway board, and the inhabitants have recently resolved to adopt the Local Government Act, but that has not yet been put in force.

2060. Then any nuisance that may exist can only be remedied through the board of guardians at present?—Yes, through the board of guardians for the whole union, but as soon as the Local Government Act comes into operation the board will have authority to deal with nuisances in Bishop Stortford parish.

2061. The board of guardians cannot initiate anything in the way of improvements, they can only act in case there is a report made to them from some of the inhabitants that a nuisance exists?—Or through the inspector. They can only make structural works where a nuisance is not abated, not otherwise, and that is to a very small extent.

2062. Feeling the want of some authority to carry out improvements in the town, the inhabitants of Bishop Stortford have applied and are about to obtain power to adopt the Local Government Act?—Yes, I understand so.

2063. Do you know at all in what condition the public health is?—I think it has been pretty healthy as a whole—quite healthy.

2064. Is the town generally considered a healthy town?—I believe so.

2065. Do you know what the return of the registrar is as to the deaths per thousand?—I do not know that.

2066. Have there been any sewerage works carried out in the town?—No; except by the ordinary sewers draining into the river.

2067. Under whose direction were they constructed?—Lately they have been under the highway board; before their formation these matters were under the direction of the surveyor of the highways under an old Act of Parliament.

2068. Do the sewers discharge into the river?—Yes. The plan has been for many years for the parish to provide sewers for the houses as they were built, and into which the occupants of the houses might turn their filth, those sewers meeting each other in the town and discharging themselves eventually into the river.

2069. Are they carried out upon anything like a system?—I should say not. From time to time the surveyor of highways, and subsequently the highway board, have had a sewer made, and they have improved the sewers from time to time, and they have made others as they found that a greater quantity of filth required to be sent away. Thirty-five years ago there were not above two or three waterclosets in the town, but now they are to be numbered by hundreds.

2070. What manufacture is carried on in the town?—It is malt principally.

2071. Can you give any information as to the number of quarters of barley that are manufactured into malt in this neighbourhood?—No; but there are gentlemen here who will tell you that.

2072. Do you know of any nuisance that arises from the making of malt?—No, I do not think there is any particular nuisance except this, that the water from the cisterns in which the barley is steeped is turned into the river, and that helps to contribute to the pollution of it at certain times of the year, but as malt is made in the winter time the flood water carries everything away, and I should say that no great nuisance can be caused.

2073. Have you at any time observed that the liquor which is passed away after the process of steeping is objectionable?—I cannot say that I know much about that.

2074. What other manufactures are carried on besides that of malt?—None, that I know of.

2075. The town is an important town having a market, and providing for an extensive neighbourhood?—Yes.

2076. Business is carried on, I suppose, chiefly on market days?—Yes; a very large trade in the manufacture of malt is carried on.

2077. There is a canal leading to the town?—Yes, it is navigable to the town.

2078. A railway also passes through the town?—Yes.

2079. Is the traffic on the canal large?—I think it is.

2080. Is the valley at all subject to floods?—Very much so.

2081. What is the effect of those floods upon the health of the inhabitants?—I do not know. I have never had any complaints, nor has it been suggested that the public health has been affected by them. We are not flooded so much now as we were years ago. The millers do not hold up the water as much as they did.

2082. Does any person control them?—I think not.

2083. Do the waters sometimes lie for a considerable time upon the lands?—Yes, but they get away quicker than they did. If the rain continues they will be there for some days, but when the rain ceases they get away more quickly.

2084. Are they considered beneficial or injurious to the land?—They are not beneficial, I think, but it depends upon the time of year the flood comes upon the pastures. If the grass was to be mowed the flood would leave it all gritty and no animal would eat it; it would be useless to mow it; there is no doubt however that upon some pieces of land flooding would do good.

2085. Do you think it would be an advantage if there was some system of management throughout the valley of the Stort by which the water would be regulated, and better means provided for passing it off?—I should say so decidedly.

2086. Do you think that would be an universal advantage?—Yes.

2087. At the present time, as well as being a disadvantage to the meadows from the water hanging upon them, it backs against the water wheels and I presume actually injures the millers themselves?—I should say so.

2088. Any body who had power to improve the condition of the valley would not only improve it for agriculture but also for the benefit of the millers?—I should think so.

2089. How is the town supplied with water?—Principally by pumps.

2090. From what stratification does the water come?—It varies; we get the strongest springs on the hills; in some places they are 70 feet deep; all our hills are wet, and the valleys here are comparatively dry.

2091. What is the subsoil in the valley?—We get down to brick earth and loam—stiff loam; after that we get into chalk, and then find water.

2092. You are rather upon the clay?—Yes.

2093. And the chalk below is full of water?—Yes; we get gravel on some of the hills.

2094. As clerk to the board of guardians, have you had many complaints made as to nuisances existing within the union?—No; we have recently appointed inspectors for the union, and they have been at their work for three months past, since the Sanitary Act came into force, and they have removed an immense number of nuisances. Without requiring the board of guardians to interfere at all, the public have admitted the necessity of doing whatever they can, and they have met the thing uncommonly well. We found a very large number of cottage houses without any privy accommodation, and it is astonishing what a number in the last three months of new ones have been made, and others will be made. The board of guardians have not been obliged to put the provisions of the Act

BISHOP STORTFORD.

Mr. J. D. Taylor.

14 Dec. 1866.

in force against any one yet, the people have acceded most willingly; no doubt there are some cases which are now standing for consideration, but I believe that the efforts of the board of guardians and the local authorities will be effectually aided and willingly so by the inhabitants in carrying out the provisions of the Act.

2095. Before you appointed the inspectors of nuisances, did you find cases of sickness occur in certain parts of the town as distinguished from the health of the people in houses adjoining?—It has been recently so in one of the parishes of the union, where fever has prevailed to a considerable extent; in that case information was given to the board of guardians that it was caused by nuisances and bad drainage, and to some extent I believe the board considered that it was so. A great deal has been done in that neighbourhood, and the epidemic has ceased.

2096. Did that case occur in Bishop Stortford?—I think not. You may have some medical gentlemen here who will say that we have had fever arising to a great extent from defective drainage; it may be so, but generally speaking I believe that Bishop Stortford is a healthy town. We had some cases of low fever here some months ago, but it prevailed not only here but generally throughout the district, and it passed off after a time.

2097. (*Professor Way.*) The state of the public health is hardly observable by a non-medical person?—No, and I am not competent to speak upon the matter.

2098. (*Mr. Harrison.*) You are by profession a solicitor?—Yes.

2099. Have you heard of any advantage being gained from the lower price of coal by a railway being brought here?—There are gentlemen here who will give you better information than I can upon that.

2100. (*Professor Way.*) As I understand, you have applied to be placed under the Local Government Act?—Yes.

2101. In what stage is that application?—The clerk to the highway board, through whom the application was made, is here, and he will explain.

2102. It was not made through the board of guardians?—No.

2103. Do you know whether any legal proceedings have been taken as to the discharge of the sewage into the river Stort?—I never heard of any, and I believe there have been none. We have been threatened by several parties. Our neighbours at Sawbridgeworth have told us that we have been poisoning them. We have said that we are sorry for it, but we think that they contribute to the nuisance to some extent themselves, and we have therefore not heeded what they had to say.

2104. No actual proceedings have been taken against you?—Certainly not.

2105. (*Mr. Harrison.*) Has it ever been in contemplation to place the river under a distinct drainage board?—No. The nuisance of which the inhabitants have complained from the smell of the river was during the summers of 1864 and 1865, but it was very much abated in consequence of our having wet seasons, and a plan was adopted that succeeded remarkably well, and that was this: During the summer, when the water is very short, the filth will sometimes almost crop up to the mouth of the drains, and when there has been a flood in the winter this accumulation has been stirred up by a barge and a heavy rake behind, so that we have passed it on to our neighbour to some extent. We thought we had kept it long enough, and by the use of the flood water relieved ourselves from a considerable quantity of stink by that means.

2106. Do you think that there is a considerable amount of pollution in the river?—There must be, because we drain everything into it that we can.

2107. (*Professor Way.*) You say that the privy accommodation is being very considerably increased, do you mean that this accommodation is in the shape of waterclosets?—No, I am talking about cesspit accommodation.

2108. And that might indirectly affect the water if it does not directly do it?—It might; it would depend a good deal upon the position of the privies.

2109. If the town were placed under the Local Government Act could you then be required to take steps for the purpose of draining the whole of the town?—I really do not know.

2110. You have not contemplated that?—Yes, I have always contemplated that if we were put under the Local Government Act considerable works would have to be carried out to get rid of the sewage in a different way. I have foreseen that there would be very considerable outlay required, and I do not know that the town would be indisposed to make the outlay if they could see a means of effectually doing the work. The difficulty that I have always seen in the matter has been this,—that we may probably spend a considerable sum of money in carrying out some well-organized plan, and perhaps, very shortly afterwards, some general measure may be passed in the House of Commons affecting the whole country, and all we had done might be rendered useless. I believe that the inhabitants of the town and all the ratepayers have looked at it in that way.

2111. You have spoken of getting rid of the sewage; there are two stages in doing that, and the first is to get rid of it by passing it into the river?—We do that now.

2112. Not all of it, because the town is not fully sewered?—No.

2113. I suppose the more perfectly the town is sewered, if no arrangement is made to dispose of the sewage other than by passing it into the river, the greater will be the nuisance?—Yes.

2114. At first, probably, the town is contemplating, by putting itself under the Local Government Act, steps that will tend very largely to increase the impurity of the river?—I have no doubt that that has been passing in the minds of many gentlemen who have taken the subject up.

2115. (*Mr. Harrison.*) As a solicitor practising in the town, you probably know something of the ownership of the land in the neighbourhood?—Yes.

2116. Do you think there would be any difficulty in obtaining land below the town to which to apply the sewage of the town?—I have heard that there will not be any. An opinion, I know, was entertained that there would be no difficulty; probably there would be some difficulty which might be overcome. The difficulty we have always seen has been as to the meadows. They lie here very low, and they are all subject to floods frequently.

2117. Is there a considerable flow in the river?—No.

2118. What is the value of the land in the neighbourhood?—It is very valuable.

2119. Beyond a mile from the town?—It would fetch 100*l.* an acre. I speak of purely agricultural land. There is accommodation land close against the town, but that is getting very high too. Common agricultural land within a mile of the town is worth 100*l.* an acre.

2120. There are about 6,000 inhabitants?—Yes.

2121. Then you would not require more than about 40 acres of land to which to apply the sewage?—Perhaps that may be so.

2122. (*Professor Way.*) Bishop Stortford is about 32 miles from London, I think?—Yes.

2123. Is milk ever sent to London from this neighbourhood?—I think not.

2124. Is there any further information that you wish to give us?—I think not.

The witness withdrew.

Mr. Henry Glasscock (Bishop Stortford), examined.

2125. (*Mr. Harrison.*) Are you surveyor to the highway board?—Yes.

2126. How long has the highway board been formed?—I have been surveyor about seven years.

2127. It is not a highway board formed under a recent Act?—No, it is not under that Act.

2128. What is the extent of the district over which you act?—There are about 11 miles of road.

2129. Does the district include any parish besides that of Bishop Stortford?—No.

2130. Does it include the roads through the town?—The turnpike road is part of the road that is connected with the town. I have about 11 miles of road as surveyor of the highway board to look after.

2131. Has the Highway Act been carried out in Hertfordshire to any extent?—No, but in Essex it has been—at Dunmow.

2132. What are your duties as surveyor of highways?—I am inspector of nuisances and I give attention to the state of the roads.

2133. Do the sewers of the town come under your management?—Yes.

2134. How far has sewerage been carried out in Bishop Stortford?—Pretty well through the whole district where there is any house property; not exactly to the whole of it, because some of the houses are at some considerable distance from the town, and there we have not sewered, but nearly the whole of it is sewered.

2135. Is the town sewered upon any system?—It has been going on for a number of years, but not upon any scientific principle.

2136. How many outlets are there?—Seven.

2137. Where are they situated?—We commence with two in Lee Street, then we come to the end of the town and the river, there is a main sewer that empties itself there, then we have four others in South Street.

2138. Where do they discharge themselves?—Into the river.

2139. What is the size of the main sewer?—The largest is 18 inches.

2140. Of what shape is it?—It is a barrel drain.

2141. Are the houses connected generally with those sewers?—No, I should think that about 300 of them are connected with the sewers from waterclosets and there are about 400 cesspools in the parish.

2142. How are the waterclosets supplied with water?—By private individuals for their own use.

2143. Do they pump the water up?—Yes, it is all done by pumps.

2144. Have you occasion to open up those sewers in different parts of the town from time to time?—Yes.

2145. In what state do you find them?—Some part of the town lies very flat.

2146. What do you find the state of the sewers is there?—Generally there is an accumulation of grit more than soil, which gets washed in from the washings of the roads.

2147. You find them so filled?—Yes, at times.

2148. What steps do you take to clean them out?—We thoroughly clean them out when we find them in that state.

2149. Have you to open a considerable length of drain in order to clean it out?—Yes.

2150. What length of drain have you had to open out and clean upon any occasion?—From 100 to 200 feet at different places.

2151. Are they constructed generally below the surface?—Yes.

2152. At what depth are they below the surface?—They are not very deep, on account of the fall to the river. A large portion of the town lies exceedingly flat, and of course we cannot get our sewerage down very deep on account of the river.

2153. Is there any ventilation to those sewers?—No; they are principally trapped.

2154. Have any complaints been made to you at any time of the gases being driven back into the houses and causing a nuisance?—Yes; I have had complaints made.

2155. Do they continue to be made?—I should say that the cause of that is on account of our sewers being so trapped, and that private parties when they leave a house often leave their drains not trapped, and there an escape of gas takes place.

2156. You trap it in the sewers under your control, and by that means you force it up the side drains into the houses, and where they are not trapped the gases find their way into the houses?—Decidedly.

2157. Have you on any occasion known sickness to arise in a house in consequence of the gases flowing back into them?—I cannot say that I ever did; but parties have sent for me frequently, and I have found that that was the cause, and in such cases the thing has been remedied.

2158. If there was a proper system of sewerage in this town, there ought to be no occasion to open the drains in the way you have just mentioned, 100 or 200 feet at a time, and there should be no gases passing back into any house causing a nuisance?—Such is the case, no doubt.

2159. How many cesspools are there in the town?—I think there are 400.

2160. And 300 water closets?—Yes.

2161. What is the character of the cesspools?—They are made of brick dug out of the earth, and closed in.

2162. What is the soil generally in which they are made?—It principally consists of brick earth here and strong clay.

2163. Impervious clay?—Yes.

2164. Is there any percolation?—No. We should not consider so at all.

2165. What steps are taken, or do you take any, to remove the refuse collected in those places?—We have done a great deal in that way during the last few months. By order of the highway board we were directed to go from house to house and to clear out everything.

2166. At whose expense was that to be done?—Partly at the expense of the highway board, and from them at the expense of the board of guardians.

2167. Not at all at the expense of the individuals?—Not at all.

2168. What expense may you have incurred in the last eight or ten months in removing these nuisances?—I cannot state exactly, but I should think 25*l.* or 30*l.*

2169. Were the directions which your board gave you to cleanse these places out systematically?—Yes, and we have done so.

2170. Shall you continue to do so?—I have not received any further orders.

2171. Was it merely a temporary effort in consequence of the cholera being in the neighbourhood?—Yes, that was the cause of it being done.

2172. Do you not think that some measure more efficient than that is required in order to prevent nuisances continually arising?—There is no question about it, and if it is not done in that way accumulations will grow up again.

2173. (*Professor Way.*) Do you remember how many years ago it is since it was first done, or has it been done before in your recollection?—It has only been done once during my term of office in seven years.

2174. What are the sizes of the cesspools generally?—They are between three and four feet square.

2175. Does one serve for one house, or more than one house?—There is generally one for two houses and sometimes for three.

2176. I suppose the water from a house drains into the drain of the town?—Yes, principally so.

2177. Nothing goes in there in the shape of water?—No.

BISHOP STORTFORD.

Mr. H. Glasscock.

14 Dec. 1866.

2178. Do you believe that ashes are thrown in?—Yes, at the side of it, but not into the cesspool generally speaking.

2179. Are these cesspools made with clay bottoms and clay sides, and then lined with brick?—Yes, they are principally so made.

2180. Will more than two families join in the use of these cesspools?—No, not generally speaking.

2181. Two families consisting of from 10 to 12 individuals?—Quite that.

2182. As I understand you, it would take seven years to fill one of them?—They are obliged to be emptied about every second year. I was not speaking of the cesspools when I said it would take seven years. It was the ashpits that I meant. We were ordered to go and cleanse every yard. Not all the cesspools, but many, were cleansed out. I do not think that the parish had been so clean before for many years as it was at that time.

2183. Have the cesspools any overflows?—No, only into the sewers; there are some connected with the sewers.

2184. With overflows at the top of them?—Yes.

2185. You draw a distinction between cesspits and ashpits?—Yes.

2186. Will you describe the cesspools as distinguished from the ashpits?—Generally speaking the ashpits are made purposely low down in some portion of a garden—at the bottom of it. The cesspools are about from three to four feet sqaare, and of various sizes.

2187. Of what depth are they?—They are three or four feet deep.

2188. How many ashpits do you think there are?—There is one to every house; that is, not an ashpit, but there is an accumulation at every house.

2189. How do the inhabitants obtain their water?—I think as to water we are well supplied.

2190. What is the source of your supply?—We get the water from wells.

2191. Are those wells sunk through the clay that you mentioned just now?—Yes, and they get into the chalk.

2192. Throughout the township is there an abundant supply of water?—Yes, there is.

2193. Are there any gravel beds in the town overlying the clay?—Yes, just under the clay.

2194. Is water drawn from that bed in any case?—No, it is principally from the chalk.

2195. It is almost always carried through the gravel to the clays and the chalk, is it?—Yes.

2196. Is it very hard water?—I have heard it so spoken of, at least some part of it.

2197. Do the gravel beds run under the "George Hotel"?—Yes.

2198. Do you think that they get water from the gravel?—It is supposed to be one of the finest springs we have in the country. I have been speaking of the water with reference to the general health of the town.

2199. Would there be any difficulty in applying the sewage to the land below the town for irrigation?—That has been thought of, but I think there would be a difficulty in it.

2200. What would the difficulty be?—On account of everything lying so low.

2201. You could pump it?—Yes.

2202. If you were obliged to pump it, would there be any difficulty in obtaining land?—I believe some offers have been made of that description.

2203. What is the condition of the river as it passes through the town in consequence of the sewage being delivered into it?—We do hear complaints about it.

2204. From whom?—I have heard complaints from Sawbridgeworth, from people living there by the river.

2205. Have any complaints been made by residents in the town of Stortford?—Not particularly, that I am aware of; Mr. Davis has complained to me about it.

2206. Does he reside near the outfall of one of these sewers?—Not exactly; he is between two of them.

2207. How far are they apart?—I think they are from 200 to 300 yards apart.

2208. He is situated between the two, and not near either of them?—Yes.

2209. Which of them is he nearest to, the upper one or the lower one?—The upper one.

2210. When complaints of this kind are made to you, do you report them to the board?—They have been made to the board.

2211. Are they entered in a book when they are so made?—Minutes are always kept by the board.

2212. (*Mr. Harrison.*) They would appear in their books?—Yes.

2213. During the summer season is there much water coming down the Stort?—No.

2214. What becomes of the refuse from the sewers when there is so little water in the river?—It must of course accumulate.

2215. It would accumulate in the bed of the river, would it not?—Decidedly.

2216. And become a nuisance, and as you say, it would be complained of by some people?—Yes.

2217. As surveyor do you take any steps to remove the nuisance?—In the case of a flood we stir it up, if we have an overflow of water.

2218. And send it on by the flood to your neighbours below?—Yes, we get rid of it.

2219. Are you aware that the water, after it goes from here goes to London, and is one of the sources of the water supply?—Yes.

2220. Do think that that should be permitted to continue?—I have no doubt that some steps will be taken to remedy that sort of thing.

2221. (*Professor Way.*) When you stir it up, I suppose it is about at its worst?—That is the only means we have of disposing of it; when we get a flood we get rid of a large amount of it.

2222. Do you fancy that discharging the sewage occasionally in a flood, or discharging it regularly day by day so as to be able to distribute it equally, would cause the greater nuisance?—We cannot get rid of it except at the time of a flood.

2223. But the form in which you get rid of it probably constitutes the greatest nuisance you could create?—Yes.

2224. (*Mr. Harrison.*) Have you, as surveyor, to collect rates to meet the expenses of the highways?—I had to collect rates until within the last six or eight months.

2225. What is the rateable value of the parish?—I think that the last estimate was 23,700*l.*

2226. What is the annual rate in the pound collected for the maintenance of highways and for your superintendence?—It has been 8*d.*, this year it will be 1*s.*

2227. (*Professor Way.*) Do you know how many of these cesspools have overflows?—About 300. I mean the refuse of the waterclosets that flow into our sewers.

2228. I think you stated that the cesspools have an overflow at the top?—Yes; some of them have. I am speaking of those; I included those in the water closets.

2229. The waterclosets have cesspools, but with overflows?—Yes.

2230. Then the refuse in them does not go direct from the waterclosets into the drains?—Not all of them. I consider that there are 300 which are connected directly with the sewers.

2231. Have they any cesspools?—No; certainly not. I mean that there are 300 waterclosets that drain into our sewers, that go into the river.

2232. How many waterclosets are there, as we understand them generally, the contents of which go direct into the sewers?—I cannot say off hand.

2233. Do you think that the majority of them have cesspools as well as drain into the sewers?—Yes.

BISHOP STORTFORD.

Mr. H. Glasscock.

14 Dec. 1866.

2234. It is only the liquid that drains into the sewers?—Yes.

2235. In London the houses have direct connexion, by means of a pipe running into the main drain, without any cesspool at all?—Yes.

2236. On the other hand, we know that there are such things as cesspools in the country districts with overflows into drains. What is the general character of the waterclosets here?—Some 10 years ago, when there was an order given with reference to the sewerage of the town, many of the waterclosets were connected with the drainage direct, that I am now speaking of, still they had no water supply further than that which they drew for themselves. They had no pumps.

2237. Have those got cesspools?—No; the cesspools were done away with at the time that these places were connected with the sewerage.

2238. How many do you suppose there are connected directly with the sewers but without cesspools?—I should say 300. We were ordered some years ago to take the sewage direct from the waterclosets into our sewers, and they were then connected with the sewerage.

2239. The figures I have taken down are the 400 cesspools and 300 waterclosets. Do you mean to say that those are all waterclosets, but that 400 are waterclosets with cesspools, and the 300 are waterclosets communicating directly with the sewers without cesspools?—Yes; as near as I can give it.

2240. (*Mr. Harrison.*) How many privies are there in the town?—I think there are 400.

2241. I believe the highway board consists of the whole of the ratepayers in the parish?—Yes; they are selected from the parish.

2242. For how long are they appointed?—They are appointed every year.

2243. Of how many do they consist?—Thirteen.

2244. Is there any other officer besides yourself?—Yes; there is a clerk.

2245. Are there men employed under you?—Yes.

2246. How many are there employed?—The number varies from five to seven, according to the nature of the work.

2247. Are they employed in repairing the roads and opening and constructing drain?—Yes; when they are required. My own men do not construct drains.

2248. Not the main drains?—Not the men under my control. They do not do anything of that sort; the work is put out to tender, and it is done by the parish.

The witness withdrew.

Mr. R. Hunt.

Mr. Richard Hunt (Bishop Stortford), examined.

2249. (*Mr. Harrison.*) Are you resident in Bishop Stortford?—No, but I come here occasionally.

2250. Are you a native of the town?—No, but I have known it from childhood.

2251. Do you own any property in the town?—Yes.

2252. What is it?—South Mill.

2253. How long have you owned it?—About nine or ten years.

2254. Have you resided there at any time?—No, but I go there two or three times a week sometimes.

2255. Is that mill near to any of the sewers that the surveyor has spoken of?—It is just below them all, I think, about a mile from here.

2256. Is there any nuisance arising from the sewage of the town being passed into the Stort?—Very great just now, and there has been in the last two or three years.

2257. How does it affect you at the mill?—The stench in the mill and dwelling-house and the neighbouring yard and garden is very bad in the autumn and summer of the year, so bad that in 1865 the miller who lived in the mill-house complained that he was obliged to send his wife and children away.

2258. Is there no one living there now?—Yes, but he sent them away in the dry time.

2259. Was their health affected by it?—Yes, very much.

2260. Had they to call any medical man in consequence?—Yes.

2261. Did he attribute their sickness to the condition of the river?—Yes; and he complained himself when he went into the house, so much so, that I consulted my solicitor about it, and I talked to Mr. Taylor and threatened proceedings against the town, but I hardly know whom to begin with.

2262. Is there much difference in the volume of water that comes down the Stort in the summer season and in the winter season?—Yes, very great.

2263. In the summer season is it reduced to a very small quantity?—Yes, very small.

2264. How many pairs of stones have you at your mill?—Two.

2265. Can you drive both of those pairs of stones in the summer time?—Not one, nor half a one. It would be I should think for about 10 hours out of the 24 with one pair of stones in the summer time.

2266. The sewage of Stortford being thrown into this small volume of water passing down to your mill increases the nuisance very greatly?—Yes, in the autumn part of the year; there is but little to complain of now on account of the large volume of water in the river.

2267. That has probably cleared away all the nuisance?—Yes.

2268. What regulations are there as to adjusting the quantity of water taken for your mill and for the canal?—The canal company have a right to take as much water as they require for passing and repassing barges, and they pay to the millers sixpence each time they fill their lock.

2269. Do you know what the size of a lock is?—Not exactly; but I think it is about 100 feet by 14 and about five feet deep.

2270. What fall have you at your mill?—About five feet or rather more—five or six feet.

2271. During the winter, when you say there is a large quantity of water passing down, do you find that your mill wheel is obstructed by tail water?—In a heavy flood, but not all the winter, for there are overflows or tumbling bays above each mill, above which the miller may not keep his water, it runs away and it does not affect us more than two or three inches when the section of the river is not so large, then it does for two hours.

2272. Is that often the case in the winter?—Yes; sometimes we have gone through a winter without a flood, and sometimes we have six or ten down in the same time.

2273. For what length of time do they obstruct your work?—It is variable; perhaps two or three hours; I mean not more than that unless we have two heavy falls of rain continuously, and that is very seldom.

2274. Have you any land adjoining the mill?—Yes, I have two acres.

2275. Are they liable to be flooded?—No, not unless it is a very high flood. I believe they have been flooded once or twice.

2276. Is the land that is flooded benefited, or otherwise, by it?—The land which adjoins the mill will be benefited by the flood—the small piece that belongs to me.

2277. Would the remainder of the land nearer the river and lying at a lower level be benefited in a similar manner?—Not unless there was a good drainage to it to get it off quickly.

2278. Is there good and sufficient drainage to the land in the valley of the Stort?—I am not able to answer that question. I have a very good knowledge

BISHOP STORTFORD.

Mr. R. Hunt.

14 Dec. 1866.

of my own land; but I think there is generally good drainage in the valley of the Stort.

2279. In coming up by the railway last night I observed a great deal of land which appeared to me to be in a very indifferent condition?—Yes; lower down there is a large piece of land called the Mead, of 160 acres, and that is very frequently under water; it will be now drained and inclosed.

2280. Is that to be done under a special Act of Parliament?—Not for the parish, only under the General Inclosure Act.

2281. Not under the powers of a new Act?—No; besides the inclosure they will carry the outfall below another lock in order to get more fall.

2282. Does that merely extend to a short length of the river?—Yes, about a mile and a half or two miles.

2283. Do you not think it would be much better to have the river put under some general management, and carry out arterial drainage efficiently throughout the whole length of it?—I have not sufficiently thought of that to be able to give an answer to the question.

2284. Is what you have mentioned being done with the consent of the millers below?—There is no mill, as it happens, at this lock.

2285. Is there a weir without a mill?—Yes, a waste weir, and that is near the junction of the Stort with the Lee.

2286. As an owner of mill property, if there was a good system of drainage carried out throughout the valley, and if the flood waters were carried off more uniformly than they are now, would you not be benefited rather than otherwise by such a measure?—Yes, in some cases. I have a mill nearer to London, and and we suffer very much from flood water there.

2287. Is that upon the river Lee?—Yes, it is the last mill but one on the Lee, at Edmonton.

2288. Do you suffer at all from back water?—Yes, we suffer from back water and from the water getting out on to the meadows and lying there for days together.

2289. Do you live near to that place?—No, I live near to the junction of the Lee and the Stort.

2290. Are you near to the valley that is liable to be flooded?—Yes.

2291. Do you know whether the flooding of that district affects the health of the people living there?—I have heard that it does not; they say that a case of ague is rarely known in the valley of the Lee.

2292. Have you ever known of any cases of ague?—Very rarely; only one or two.

2293. Have you known fever to occur after the valley has been flooded for a considerable time?—No, I have not, the valley is so thinly populated.

2294. Is there any arrangement as to the payment by the Canal Company generally throughout the valley of the Stort?—The whole way down. I think it applies generally to every mill but one, and there are 11 or 12.

2295. What is the exception in that case?—I do not know.

2296. For each lock of water a payment is made of 6*d.*?—Yes.

2297. Is that so in the case of each lock?—Yes, it is paid to the miller adjoining. The barge owner generally pays 1*s.* when he goes through, and he comes back for the same payment.

2298. Does that repay the miller for the use of the water?—No, certainly not.

2299. If you had the water to use which they take, I suppose you would be able to turn over something more than 6*d.* by its use?—Yes, three times the money.

2300. (*Professor Way.*) Do the bargemen open the locks?—In some cases the owners of the canal keep a lock man to work two or three locks.

2301. The miller does not do it?—No. As to the injurious effect to health by the drainage being passed into the river, I may say that it was not so a few years ago. When I was a boy there were plenty of gudgeon and small fish in the river, but now one cannot live in it. A friend of mine lives 10 miles lower down, and he will tell you that he can remember when there were fish in it there.

2302. What is the condition of the water that comes down to your lower mill at Edmonton?—There it is apparently clear, but this water goes there and the water from Hertford too.

2303. Then they will have at Edmonton a larger volume?—Yes. I have a mill also at Stanstead, and there the water is offensive at times from the drainage of Hertford.

2304. Notwithstanding the steps which are taken at Hertford to purify it?—Yes; I have passed along the towing paths and I have had to put my handkerchief to my nose on account of the stench; that has been in the autumn of the year.

2305. Is the sewage of Ware turned into the river?—Yes; nothing is done with the sewage there, it comes in neat, but the sewage of Hertford is deodorized. The New River Company has a fixed volume of water from the river Lee above the point where the sewage of Hertford comes in, and they take in the autumn, when the water is short, nearly their full quantity, and we have scarcely any water in the Lee then.

2306. How are you paid, as a miller, for the water that is taken out there?—The millers receive no payment; it was done first by agreement some 150 years ago with the river Lee trustees, but since then there has been another agreement made, in 1851, by which they were to take a further quantity of water, and the millers were deceived.

2307. How many pairs of stones do you drive at the mill below Ware?—I had 10 when I first took it some 25 years ago, but the water has got considerably less, and we have but six now at work.

2308. Can you work them constantly in summer and winter?—No; nor can we work two in some summers. As I have said before, in a dry summer the quantity of water that is taken by the New River Company is always the same, and it takes all the water almost away; we have not water then for more than one or two pairs of stones.

2309. Is the water that is taken by the navigation larger than it was formerly?—I do not think it is; I think it is rather less at Stanstead weir.

2310. The diminution which you experience arises from the New River Company taking a larger volume?—Yes; there is certainly less water in the valley than there was 20 or 30 years ago.

2311. How do you account for that?—In this way, a great deal of woodland has been destroyed and there is less rainfall.

2312. Have you observed the rainfall over a series of years?—I have been informed that where the gauges have been kept they have found it so; they have been kept by the New River Company.

2313. Do you know how long they have been kept?—I believe for some years. I should mention that they have been sinking a number of deep wells at the lower end of the valley.

2314. Does that affect the discharge of the water in the upper parts of the valley?—Yes.

2315. The water which they abstract must come from somewhere?—Yes, it comes down through subterranean channels, but we cannot get the water we used to have. Who has got our water? We know that we have lost it; and the old millers will tell you that there is not now nearly the quantity of water there was 30 years ago.

2316. After making allowance for the increased quantity of water the New River Company take, you find that there is less?—Yes; and that applies to this stream particularly. We have no control or power at all, and there were two mills that I knew, which in the course of 20 years have been done away with because there was not a sufficient quantity of water to make it worth anyone's while to occupy them. On another branch of the Lee, the Rib, the river is entirely dry, there is no water for a mill.

2317. Do you know of any other cases where mills have been abandoned from a similar cause?—Not that I can speak to.

2318. How many years have you occupied the mill below Ware?—25 years.

2319. In that period have you experienced a marked diminution in the volume of the water?—Yes; I have a mill also, and my family have two, on the Ash, which is another feeder of the Lee, and there again the water has disappeared in my time. More than one half the upper portion of the Ash is dry now.

2120. That I suppose would not be affected by any obstruction of water by the New River Company?—Not at all.

2321. You attribute the falling off of the water to two causes, the clearing of woodland in the neighbourhood and the consequent diminution in the rainfall and the abstraction of water by extensive pumping establishments?—Yes, by brewers and manufacturers, and there are many other causes that might be mentioned; for instance, farmers have taken to deep drain their heavy spongy land which retained the water very much, mixed varieties of soil containing gravel which would hold the water and supply us in the summer; through these lands they have driven five feet drains and these cause a flood in the winter, but the water is short in the summer; that is another cause. But I think the principal cause is the deep wells which have been sunk near London called artesian wells,

2322. (*Professor Way.*) Are there any deep wells in this district?—Yes, the New River Company have two or three wells.

2323. Do you think their level is interfered with by the pumping which takes place in London; we have heard that in London at the great breweries they do not pump on Sunday?—The wells I have referred to are comparatively new wells within the last 15 years, and I know they are affected. They sunk a well 15 or 16 years ago at Amwell and that is almost dry; they are spending money now to get lower down.

2324. Have you heard that the wells at Watford and some other places in the neighbourhood of London, in the chalk, are deepest on a Monday morning, and that they have several feet more water then?—No, I have not heard of that.

2325. Because the brewers have not been pumping on Sunday?—That may be so. In the autumn of the year the brewers do work very much, and the New River Company, in the largest wells about here, pump all Sunday.

2326. (*Mr. Harrison.*) Do you know whether at your mill below Bishop Stortford any of the nuisance you have mentioned arises from refuse poured in by maltsters?—Some little of it may, but I do not think it will affect us. We did not complain before the sewage of the town was turned in.

2327. Was malting carried on to as great an extent then as it is now?—Not quite to so great an extent, but the water that comes down from the cisterns is not always bad and is not at all offensive if the barley is clean; sometimes it is worse.

2328. Generally speaking, I believe it is delivered in the autumn and winter when there is an abundance of water in the river?—Yes, in the winter and spring.

2329. Have the millers below you experienced a similar kind of falling off in the quantity of the water near Edmonton?—Yes, they find that it is very much less.

2330. How many pairs of stones do you drive there?—Fourteen.

2331. Are you enabled to work them all in the summer?—No.

2332. How many are you able to work?—The number varies; sometimes I work them all for two or three years together, sometimes I work six or seven pairs, and sometimes only five. I know a mill where I was engaged when I was a boy, and there were there but six pairs of stones with bad machinery, and I never knew a year that they did not have as much water run to waste as they used. We work about five or six pairs of stones now from shortness of water.

2333. Would that diminution in the volume of the water, do you think, be accounted for by the increased abstraction of water by the New River Company and the East London Water Works Company?—Not by the East London Water Company, because they take water below us.

2334. Would it then be accounted for by the increased quantity taken by the New River Company?—Yes, I think so, and by the other causes I have mentioned.

2335. Have you much nuisance to complain of at that mill near Edmonton?—No.

2336. Do they suffer from the flooding of the water below you?—No; my partner lives on the bank of the river, and he has a large family, and they are remarkably healthy.

2337. (*Professor Way.*) You have attributed to two principal causes the falling off of the waters of the Stort of late years, viz., the diminished rainfalls and the wells; I suppose that one of those may be a substantial and obvious cause—the wells?—Yes.

2338. Might they not account for the greater part of the diminution, if not the whole, without taking into account the smaller rainfall?—I have been speaking of rain gauges kept in London, not here.

2339. It may be a fact, and probably is, that the cutting down of trees generally has diminished the amount of the rainfall?—The underground and the wood was a great reservoir of water in the summer time. It held the water up much longer.

2340. Your statement that there is less rainfall might be controverted, but it does not follow that you are in error in saying there is less water in the valley?—I know that as a fact.

2341. (*Mr. Harrison.*) Has that diminution been marked within a short period?—No; it has been going on as long as I can remember.

2342. The water has been gradually diminishing since you can remember?—Yes. I can mention half a dozen places where feeders of the rivers Lee and Stort had mills upon them, but in which there is now no water at all.

2343. Will you just mention them?—Bendfield, Elsenham, Haddam, and Waltham Abbey are instances.

2344. The cases you have mentioned are cases of mills which you know were in existence some years ago, and which, in consequence of the diminution in the water, if not its total abstraction at certain points, have ceased to exist?—Yes; they have been given up.

2345. Is there anything more you wish to mention?—No.

The witness withdrew.

Mr. JOHN D. FAIRMAN (Bishop Stortford), examined.

2346. (*Mr. Harrison.*) Are you a resident here?—Yes.

2347. Do you carry on business here?—Yes; I am a maltster.

2348. Have you been engaged in that business for many years past?—I have been in business for 14 years. I have lived here for about 18 years, and my father before me.

2349. Can you give us any information as to the number of quarters of barley that are converted into malt at Bishop Stortford in a year?—I can tell you what I do at Bishop Stortford, and that is about 40,000 quarters.

2350. Is that a large proportion of what is malted here?—It is a large proportion.

BISHOP STORTFORD.

Mr. J. D. Fairman.

14 Dec. 1866.

2351. What proportion does it bear to the whole?—I cannot tell you.

2352. How many maltsters are there in Bishop Stortford?—Seven or eight.

2353. What becomes of the water which you use for steeping the barley?—From my maltings it nearly all goes into the river.

2354. Is it objectionable in its character?—I do not think I have ever had any complaint made about it. I have not found it any nuisance, and I have often been in the habit of going round the maltings when the water has been let off. I may say that I have not had two complaints made since I have been in business.

2355. Have you noticed in other cases that the water so discharged has been a nuisance?—No.

2356. Some of the malthouses lie up the hill, do they not?—Yes; I have several that are up the hill.

2357. Where does the water pass to from them?—I suppose it goes into the main sewer, and thence into the river.

2358. Is the barley that you malt here chiefly grown in this neighbourhood?—No.

2359. Where does it come from?—From Norfolk, and Cambridge, and Essex.

2360. Has the malting trade of Bishop Stortford increased of late years?—I should say that it has increased very much.

2361. How would you account for that increase of trade?—I may observe that the railway has benefited me, because if the supply of barley here is bad I can get it from an equal distance with other people, and that puts me on equal terms with the rest of the world. My business is certainly two thirds, and more than that, larger than it was before the railway was brought here.

2362. You have derived a benefit from the railway passing through this district?—Certainly I have.

2363. Is the canal used for the carriage of barley and malt to any great extent now?—I cannot tell you. I only do business with the railway company.

2364. You receive your barley by railway and you send it off, converted into malt, by railway?—Yes, that is so.

2365. How do you get your coals?—I get coals both by the railway and the navigation. The one is a very wholesome check upon the other.

2366. Do you live in the town?—Yes; on the top of the hill.

2367. Have you observed the condition of the river from time to time?—Yes.

2368. What is your opinion as to its condition in consequence of the sewage of Stortford being passed into it?—I have known it to be in a very bad state.

2369. At what period of the year?—In the summer.

2370. In dry seasons?—Yes; and we have had several complaints made about it to the highway board. I am a member of it, and that is why I suggested to our surveyor that we had had several complaints from persons living close to the river; for instance, Mr. Taylor has represented that the stench has been so great that Mrs. Taylor could not sit in her drawing room in the evening, such was the state of the water; but we got rid of it entirely by means of a barge with a large rake behind stirring it up and passing it on.

2371. As a highway board, I believe you have applied to be placed under the Local Government Act?—Yes.

2372. Do you propose to carry out a system of sewerage in this town?—I have voted for it and for this reason, I thought that something would be done which would benefit the town.

2373. Are you aware that the sewage of many towns is now very successfully, and with advantage to the towns, applied to the land in the neighbourhood?—Yes; we thought of that. The highway board have all come to the determination that something will have to be done, and the question was, what was the best thing to be done.

2374. Do you propose to carry out a system of sewers?—I do not think we have any plan.

2375. Do you propose to have any water supply urther than you have at present?—I cannot tell you, but we shall get the best opinion we can.

2376. Where do you obtain your water for malting?—From wells.

2377. Is that water very hard?—I consider that the water is very hard. It is very hard in my own house.

2378. Is it suitable for malting purposes?—We consider that we make pretty good malt here, and I suppose the water must be good.

2379. As a maltster, should you consider that hard water or soft water was better for brewing?—I think I should prefer soft water if I was asked.

2380. What is the effect of the application of water, is it to encourage the growth of the barley?—Yes; and the quicker it grows the better.

2381. Do you think that soft water would produce that effect?—Yes, I fancy so.

2382. (*Professor Way.*) There is no particular secret, I suppose, in the making of malt?—Not any that I know of.

2383. The barley is first soaked in water?—The barley is first steeped in water.

2384. In a large quantity of water or only enough to cover it?—Just enough to cover it.

2385. How long does it remain so?—Sometimes 48 hours and sometimes 64 hours, but it depends upon the barley.

2386. It remains until it is soaked?—Yes; it depends upon the season.

2387. Do different kinds of barley produce different coloured waters?—Yes; I should say that barley from heavy land gives water a much higher colour than barley from light land.

2388. Heavy land is not so good as light land for growing barley, is it?—I prefer barley that is grown in light land.

2389. Not only because it malts better, but I suppose it is better for the brewer?—I suppose that they get a greater amount of extract from it.

2390. You pay more money for barley grown in light land, do you not?—No; that depends upon a man's opinion.

2391. Does not a farmer get more profit out of light land than out of heavy land?—That I cannot tell you.

2392. (*Mr. Harrison.*) Have you ever known a case in which, after converting barley into malt, the barley has increased to such an extent in bulk that the exciseman was inclined to disbelieve the fact and to fine you?—I do not believe that barley, if the trader is an honest man, will increase to such an extent as to give any exciseman good grounds for suspecting anything. I think, generally speaking, there is nothing in the ground in which the barley is grown.

2393. (*Professor Way.*) What is the colour of the water that you run off after the barley has been steeped in it for 48 hours?—Of a deeper colour than the wood work there.

2394. Is it thick?—No, I think it is not thick sometimes.

2395. Will it settle if put into a vessel?—Yes.

2396. Something falls to the bottom?—Yes.

2397. What is that?—I cannot tell you.

2398. Is part of it dirt?—Yes.

2399. And the liquid will still remain of that colour?—Yes.

2400. Do you know whether that water has ever been applied in any way to grass or any other culture?—I have not heard of it.

2401. Do you think it would be possible to use it and to pump it over grass land?—Yes, it might empty itself into a tank if it was anywhere where it could be so used.

2402. Supposing it not to be so used, the water must pollute the river?—I suppose you will compel us to take it away.

2403. Could you pump it over any ground?—No,

you must carry it away. The maltings are all in the town, and you could not pump it on to the land.

2404. I suppose when you speak of soft water you would get more colour out of the barley with that?—No, I do not fancy so; we very often change our water in 24 hours.

2405. (*Mr. Harrison.*) What volume of water do you use to a certain number of quarters of barley?—We first fill the cistern with barley, and we keep pumping in the water until the barley is covered.

2406. You do not use a very large volume of water?—No, certainly not.

2407. Of what size are your tanks?—The cisterns are of different sizes, according to the malting.

2408. (*Professor Way.*) Do you pump by hand?—Yes.

2409. You cannot tell how much water you use?—Not in the least.

The witness withdrew.

Mr. Thomas N. Miller (Bishop Stortford), examined.

Mr. T. N. Miller.

2410. (*Mr. Harrison.*) Are you also a maltster?—Yes.

2411. What number of quarters of barley do you malt in a year?—From about 10,000 to 12,000.

2412. What is the size of the tanks in which you steep the barley?—They vary.

2413. How deeply do you put the barley into the tanks; do you fill them full?—The cisterns are generally full.

2414. Can you give me the dimensions of one of those cisterns?—They are so very various, according to the quantity; some will steep only about 20 qrs.—I am not speaking of ours in particular—some will steep 20 qrs. and some 100 qrs.

2415. Take some of your own?—Some steep 70 qrs.

2416. What are the dimensions of a cistern that will steep 70 qrs., what length is it?—I really cannot tell you exactly. I believe 10 cubic feet will hold a quarter of barley.

2417. Do you malt wheat here as well as barley?—We do not, and I do not think it is malted in the town.

2418. What becomes of the liquid after the steeping?—It passes through the sewers into the river.

2419. Does it cause an objectionable smell at any time?—I think if it was passing through any length of sewerage, for instance, if it was passing through the town sewerage, that at times it would be objectionable.

2420. Fermentation would be set up, and it would smell badly?—Yes.

2421. There is nothing in that liquid that would be mischievous to vegetation if it was turned on to the land?—Rather otherwise, I should think.

2422. It would improve the sewage for irrigation purposes?—I think so decidedly.

2423. You are chairman of the highway board?—Yes, at present. I have been a member of the highway board for nine years out of ten since it has been formed. I have been chairman only during the current year.

2424. Did you hear the evidence given by your surveyor?—Yes.

2425. Are the facts that he stated correct?—I think there were certain facts that he did not attach sufficient importance to; I think he did not attach sufficient importance to the complaints that we, as a board, have received from individuals at different times.

2426. Have you received from individuals a greater number of complaints than he mentioned?—I think we have.

(*The Surveyor.*) I stated that some had been made to me; but that the principal complaints had been made to the board, which are entered on the minutes by the clerk of the board. I thought you were asking me about complaints that were made to me individually.

2427. Complaints might have been made without your cognizance?—Yes, of course I was aware of them, and I said that the minutes would show them.

2428. (*To the witness.*) Have these complaints been more frequent of late?—Yes, and they would have been very much more frequent had it not been in contemplation to effect some general system of drainage which would remedy the evil. I believe that the inhabitants have no wish to throw impediments in the way, and in consequence of this measure being in contemplation the complaints have been fewer. I believe that if it had not been we should have had a great many more serious complaints, and frequent applications to the board.

2429. Do you attribute the increase in these complaints to a larger quantity of sewage matter being passed into the river?—I think there can be no doubt about it; in the early part of the year there certainly was not so much, not nearly so much.

2430. Have the waterclosets been increased considerably of late years?—Yes, very much so.

2431. Within how many years?—They have been within the last five years very materially increased.

2432. Has the malting business carried on in Bishop Stortford increased of late years?—It has increased.

2433. Then the refuse from the malthouses and the sewage are both sent into the river, and both accumulate more or less matter in the river adjoining the town?—Yes. We have one very important street here called South Street, and the drainage lies upon a level with the river, and the consequence is that the accumulations in that sewer must be such as to be very detrimental to the health of the people. We had at the lower end of South Street last year several cases of fever, and several deaths from fever, and I have no doubt that medical gentlemen will be able to give you some evidence in reference to that. I believe, under our present system, that that street lies so low that it is impossible to get the accumulations out even into the river, so as to render that neighbourhood healthy, without adopting some improved system of drainage by carrying the sewage actually away. I may mention that this being a gigantic question it has very much for the present limited the action of the highway board.

2434. (*Professor Way.*) Do you know how soon you are likely to come under the Local Government Act?—I think in about a month.

2435. Have you sent in any plans or proposals in applying to be so placed under that Act?—No.

2436. Do you know that it would be useless to carry out any large sewerage works without a large supply of water?—Yes, that is my own idea, and I think it would be the greatest boon to our parish to obtain a large supply.

2437. (*Mr. Harrison.*) Have you not a mill in this town?—Yes.

2438. What is its fall?—About an average fall, I dare say, of five feet.

2439. What is the next mill to it?—The next mill belongs to Mr. Hunt, that is called South Mill.

2440. There the fall, I believe, is about five feet?—Yes.

2441. Is there not a mill at Twyford?—Yes.

2442. What is the fall there?—Something similar.

2443. That will make 15 feet of fall within a mile and a half of the town?—Yes.

2444. With such a fall there cannot be very much difficulty in getting the sewage of the town on to some land without any pumping?—The difficulty that has always presented itself to us has been the difficulty of getting quit of it after getting it on the land, or into the reservoirs.

2445. If you were to carry out a good system of sewerage, and carried your sewage away to the land, no reservoirs would be required; you might have a

BISHOP STORTFORD.

Mr. T. N. Miller.

14 Dec. 1866.

trap to catch all the heavy gravel and so forth, but the whole of the rest of the sewage might be passed on to the land day by day as it came from the sewer's mouth summer and winter?—But will the landowners receive it?

2446. You must make your own arrrangements about that. You ought to secure, either by lease for a very long term or by purchase, land to put the sewage on, and have it completely under your own control, so that the sewage should be put on to the land and purified before it passed into the stream?—That is a matter for our consideration.

The witness withdrew.

Mr. C. Barnard.

Mr. Charles Barnard (Harlow) examined.

2447. (*Mr. Harrison.*) Do you reside here?—No, at Harlow, but I own property in Stortford. Two sewers go through my property, one on one side of it and one on the other, in this street.

2448. You occupy some mills, I believe, in the town of Bishop Stortford?—Yes, and in the town of Harlow, but the property I own here is just below; there are two sewers running into the river from the town and they are most offensive.

2449. Do they run above or below it?—One below and one above the mill.

2450. Do you experience any annoyance from those sewers?—They are exceedingly offensive; in the summer time very much so. My men have been made ill by it at times.

2451. Are there many houses adjoining the river there, as well as the mill?—Yes; a great number all the way in the direction of South Street. The houses are very thick there.

2452. Those are inhabited houses?—Yes.

2453. You believe that the annoyance you find at the mill must be experienced by those people?—Yes; it is experienced by my men who work in the mill a good deal. The mill is right on the river, and the smell is most abominable at times.

2454. Have you known sickness to prevail among your men in consequence of that smell?—Yes; ast summer especially.

2455. The water in the stream, we have been told, is lowered very considerably in the summer time, is that so?—Very much so.

2456. Any sewage thrown into it must create a great nuisance?—A great nuisance. It not only does so here but it comes down to our place at Harlow where I have some land on the side of the river.

2457. You experience an annoyance, do you, from the sewage of Bishop Stortford at that distance?—Yes. I have a memorial here that we sent to the highway board in 1865 complaining of it, and I have the correspondence.

2458. The highway board have applied to have the town placed under the Local Government Act?—Yes; I know that they have.

2459. They are considering the question of carrying out a more thorough system of sewerage?—Yes; I have always said that they must come to that. The question would be a question of time, but the answer that they gave us was that they had not sufficient powers.

2460. If they carry out a system of sewerage and bring down more sewage into the river they will only increase the nuisance?—Yes. Some gentlemen have told you truly that they have sent men to work here; they have barges in the river for the purpose of raking up the sewage and sending it down to us below. We say that we have received it, but we do not very much like it.

2461. At the same time that they carry out a system of sewerage for the improvement of the town, it is necessary that they should take steps to pass the sewage on to the land?—Yes; that has been my opinion for many years.

2462. What is the fall at this mill?—Mine is a steam mill.

2463. Where do you get water from?—Out of the river, and we put it in again.

2464. What becomes of your ashes?—The ashes are sold. We do nothing but take the water out of the river, but all the condensed water goes back again.

2465. Have you any water power?—None at all.

2466. Is it generally the case where there are flour mills here, that they are applying steam power to them?—Yes, generally; there are several instances. I built two myself.

2467. So as to be able at all times to do a certain quantity of work?—Yes; at all times. I had a mill some years ago, a water mill, on the stream, and I put up a steam engine there, and when I gave the mill up I brought it away again.

2468. How do you obtain coals?—Sometimes by river and sometimes by rail.

2469. Have you found the competition caused by the railway to alter the price of coal at all?—Yes; it has cheapened it very much.

2470. How much per ton?—Something like from 5*s.* to 7*s.* compared with what we used to pay. We used to pay 23*s.*, now we get it by railway at 16*s.* or 17*s.*

2471. What quantity of coal do you use in a year?—About 10 tons a week.

2472. Five hundred tons a year, with a reduction of 7*s.* per ton?—Yes; which is a very considerable advantage.

2473. Has that reduction in the price of coal been enjoyed by the whole of the town?—Yes, by all.

2474. If they are obliged to use a little coal in pumping their sewage, the reduction in the price will be rather a benefit to them?—Yes, a very great benefit; the pumping is done so easily, and the machinery now is so good for pumping it. I know that it is very easily done.

2475. Have you experienced any annoyance from the malt works as well as from the sewage?—No. I do not think that the waste water from the maltings is of that deleterious nature as to cause any nuisance in the river. There is a little spirit in the water, but no great deal of sediment; now and then in the summer time there is sand. There is a little spirit in the water, but there is such a large amount of water that it does not pay to take the spirit out of the water. The barley is covered with the water; it lies under it for about 48 hours, and then the water is drawn off, and in that water there is a certain spirit or a certain gum, and that goes into the river, but it is not at all putrid or deleterious.

2476. (*Professor Way.*) It would become putrid if it was kept?—Yes, most likely; there is a sort of sugar that comes out from it.

2477. Does it get sour sometimes?—Yes; it smells rather sour in summer time, but there is not much malting carried on in summer time. There used to be, and the water was rather offensive, but now it is mostly carried on in the winter time.

2478. As a maltster you discharge your refuse into the sewers?—Yes. I let my malting business to Messrs. Taylor, but the water from my malting place goes directly into the river.

2479. You could discharge it into the sewers, could you not?—Yes.

2480. Supposing the sewage is diverted from the river, and the malting water goes into the sewers and is taken on to the land, will it do any harm?—Not at all.

2481. So that in fact that question will be dependent upon the question as to the application of the sewage?—Yes; I think there is land to be got just below the river. There is a great fall from the brewery; each side rises up very abruptly. On each

side there are deep gravelly slopes that would take almost any amount of sewage.

2482. Have you had any experience yourself of the application of liquid manure?—Yes; for the last seven years.

2483. Of what nature?—Where I live at Harlow, at my homestead, I have a great number of cattle of my own in sheds. We get all the liquid manure and run it into a tank shaped like that (*describing*), and after that I put in a wire grating, and take it into another tank, and then pump it out on to the land. I pump this two or three times a week on to the pasture, and in five minutes you cannot smell anything, although it appears to be putrid before it soaks into the land, which is porous. I have done this for the last seven years, and I think it has not cost me 5*s.* in seven years. It has been very effective.

2484. Then that experience would lead you to think that although sewage and farmyard liquid are not the same things, you could do the same thing with sewage as with the other?—Yes; you are aware of one case where certain operations in law took place.

2485. What was the case?—A certain kennel of hounds used to drain into my horse pond. It was just by my house. The drains ran from this kennel right into my horsepond, and it killed my cattle. Thereupon an action ensued, and we beat the gentleman, and now that sewage is taken and put into a tank and pumped on to his land; that has been in operation for several years, and it is now very effective.

2486. What is drained from the kennels is now pumped on to the land?—Yes, and it is offensive to no one.

2487. Do you know anything of that character in your experience which is more offensive than the drainage of those kennels?—There is nothing that I know of so offensive as that is. If you opened a small bottle of it in this room gentlemen could not stay here with any comfort at all.

2488. And that is now pumped on to the land without offence to anybody?—Yes; I took one or two gentlemen down there to see it, and it made them so sick that they were obliged to have some brandy before they could recover themselves.

2489. That was at the kennels?—Yes.

2490. Has anybody seen it when it has been put on the land?—After it was put on the land it made the grass grow so tremendously that they could hardly keep it down. In the early spring of this year it was so high that there was no such grass anywhere as where the kennel sewage was put. The dogs live a good deal on animal food, and the manure is very strong indeed, but the stench is very bad.

2491. Have you any land in the neighbourhood?—Yes.

2492. Have you any land which would take this sewage?—Yes; but I have none near Stortford.

2493. How far is it from Stortford?—Seven miles.

2494. Is it below Sawbridgeworth?—Yes; I should only be too glad to get it. We applied to the highway board from Harlow, and I got up this memorial to the gentlemen of the board of highways at Bishops Stortford.

2495. (*Mr. Harrison.*) When was that?—This was in June 1865. The newspaper has a report of it, which I will read. This is what I drew up, and it is signed by Mr. Pryer Field, vicar of Sawbridgeworth, William Barnard, Sawbridgeworth, R. Barnard, Harlow, Charles Barnard, Harlow, John Brickwell, Sawbridgeworth, Thomas Unwin, Sawbridgeworth, Frederick J. Unwin, Sawbridgeworth, Francis D. Beck, Sawbridgeworth, William Poole, Sawbridgeworth, surveyor, William Franklin, Sawbridgeworth, churchwarden, John Barnard, Sawbridgeworth, Henry James Bonner, Hallingbury, and William Death, Burnt Mill, and this is what they say: "To the "board of highways, Bishops Stortford, Herts. Gen- "tlemen, We the undersigned, being residents near "to the river Stort, beg to call your attention to the "increasing pollution of this river situated within "your district. There is at the present time so much "filth, ordure, and sewage entering the river from "the cesspools and main drains which have of late "years been constructed for the purpose of draining "the town of Stortford, that from this cause the "river has not only become very offensive to many "of the inhabitants of Stortford, but also to those "who reside some miles distant from the town (where "this foul nuisance arises); and we further say that "this nuisance is particularly offensive to some "of the inhabitants of Sawbridgeworth (through "which the aforesaid river flows). The foul effluvia "arising from this river in this parish is now very "offensive, and fears are entertained that it will soon "be very much worse unless some very efficient "method is adopted to prevent the Stortford sewage "entering and daily polluting the river Stort. Some "of the inhabitants of Sawbridgeworth and its "vicinity are about to convene a meeting for the "purpose of considering the propriety of sending a "memorial to the General Board of Health for "England, asking them to send a Government in- "spector to survey such parts of the river Stort as "are or may be considered injurious to the health "of the inhabitants residing near to the river. In "the mean time we shall be glad to learn that very "efficient means are speedily to be adopted to remedy "so foul a nuisance." That was the state of the river in 1865.

2496. Since that time the highway board have taken steps for the town to be placed under the Local Government Act?—Yes; I have a letter here which was received in answer to that application. It was written to my cousin. This letter was written by Mr. William Gee, who is clerk to the board, and it is as follows: "Bishops Stortford, 19 June 1865. Dear sir, I have "laid the communication received from you in refer- "ence to the pollution of the river Stort before the "highway board in accordance with your request. "The powers conferred by the Highway Act are in- "adequate to enable the board effectually to grapple "with the question. It is therefore, proposed to "convene a public meeting of the ratepayers for "Thursday the 29th June, at 10 o'clock, when the "matter will be taken into consideration."

2497. The highway board did take the step which they mention in that letter?

(*Mr. Miller.*) The highway board called the meeting.

2498. (*Mr. Harrison.*) And in consequence of that did you take steps to place the town under the Local Government Act?

(*Mr. Miller.*) We did take steps to gain additional powers so that we may do that which may be required, and which may be considered necessary, and in conformity with the Act of Parliament. We are the greater sufferers, of course, and we are anxious to get rid of the nuisance.

2499. (*Mr. Harrison.*) Are you expecting now to have a local board formed under the authority of the Local Government Act?

(*Mr. Miller.*) We expect it almost directly.

2500. (*Mr. Harrison.*) And have you heard that it is the wish of the town to take steps to improve the condition of things?

(*Mr. Miller.*) At a large meeting of the ratepayers and the inhabitants, I believe that it was unanimous.

2501. (*Mr. Harrison.*) (*To the Witness.*) Are you the owner of property in Bishops Stortford?—Yes.

2502. Besides the mill which you occupy?—Yes; I have malting premises near it, and a sort of market garden let to tenants.

2503. Have you any house property?—Two cottages for the labourers, situated near the malting premises.

2504. And you will not object to what is provided by the local board?—No; I think that it is the best thing which can be done, namely, to tax the town for the making of a very great main sewer, which I think might be easily carried out. I do not think that there is any engineering difficulty in the way; it is only a question of money, and that as far as I am concerned,

BISHOP STORTFORD.

Mr. C. Barnard.

14 Dec. 1866.

having a good deal of property in Stortford, I shall be very happy to pay.

(*Mr. Miller.*) The Commissioners called very particular attention to the water sent from the malting cisterns, and it appears to me that they looked upon that as one of the greatest nuisances.

2505. (*Mr. Harrison.*) We only asked for information.

(*Mr. Miller.*) I did not state it at the time when I was being examined, but there is a very large brewery here, which of course discharges an immense quantity of sewage into the river, and there are also upon the banks of the river the gasworks.

2506. (*Mr. Harrison.*) (*To the Witness.*) Besides the sewers and the refuse from the malthouses, is there any other source of nuisance in the town of Stortford which you know of?—There are the maltings so far as they are a nuisance, but they are of course a very small nuisance. There is a brewery at the other end of the town, and from that I have seen a vast amount of sewage go into the river, such as brewers usually produce.

2507. (*Professor Way.*) You do not mean sewage, but a discharge of liquid of some sort?—It is very dark stuff.

2508. (*Mr. Harrison.*) In what part of the town is that brewery situated?—In the upper part of the town.

2509. Does that refuse, whatever it might be, pass right through the town?—Yes.

2510. And have you known objectionable matter to be passed from that brewery?—It looks very thick, and very muddy.

2511. Do you know what it arises from; is it from the cleansing of the casks?—I daresay that the gentleman who owns the property will give you that information.

2512. Are there also gasworks in the town?—Yes, right beside my property, and I have no means of going into the town without passing them; but the gentleman is here who has the management of the gasworks.

2513. (*Professor Way.*) Do you ever see any tar or anything of that kind floating upon the waters?—I cannot say that I have not seen tar, but the barges are a good deal tarred, and I cannot say whether it is from the gasworks or from the barges.

2514. Is it in any large quantity?—I never saw it in any large quantity.

2515. I suppose you know that tar is now too valuable to be wasted?—A great deal too valuable.

2516. (*Mr. Harrison.*) Besides being an owner of property in the town of Bishops Stortford and a miller on the banks of the river, do you farm any land in the neighbourhood?—Yes, about 500 acres.

2517. Is any of it situated in the valley of the Stort?—Yes.

2518. Is it liable to be flooded?—Yes.

2519. Is it benefited or otherwise by the floods?—Some of our land is very much benefited, and some of it is very much the contrary. When we get a surface of land like this table, and the water simply flows over it, and it soon gets dry again, the land appears to be very much benefited, there is a good deal of detritus left and a good deal of silt, and so on, and it makes the grass grow immensely. I have one field on the banks of the river, and that is very much injured by it.

2520. From what cause does that injury arise?—The water cannot get away, being dammed by the mill, and the land is constantly flooded. A few years ago, I could not grow any grass there of any value, and I dug the land and applied it to osiers.

2521. Had you any difficulty in passing the drainage below you?—Yes, the expense was so great that I would not encounter it.

2522. Are the proposed improvements in the river Stort proposed to be made in the neighbourhood of your farm?—No.

2523. That is lower down the river?—Yes.

2524. Is there much of the land in the valley of the Stort which is injured by the floods in a similar manner to what you have mentioned?—Yes, very much.

2525. Would a general system of arterial drainage be beneficial to the land in a very decided manner?—Yes, very much.

2526. Have any steps at any time been taken to carry out such a system?—Not a general system; there have been some local endeavours to put the land under drainage, and now and then, as Mr. Hunt was telling you, to put the water under another fall, and if you put it under another fall next to the mill, you can get good drainage, otherwise there has been no general system.

2527. Do you think that it would be a benefit to the land lying in the northern parts of the valley of the Stort, if the whole of the Stort basin were put under the authority of a board whose duty it should be thoroughly to drain the land, and to erect weirs, and to make the necessary arrangements for passing off the flood waters?—Very much indeed. I had a scheme, some years ago, and drew the plans myself for draining about 60 or 70 acres of land, which is now a mere swamp, and we could not carry it out, because we could not get everybody to agree to it. The land was owned by various people (I am now speaking of a large piece of land lying in and near Harlow Marsh), and we could not carry it out, because the land belonged to so many persons, that they would not all agree to the same thing, and therefore the land belonging to me is now in a swamp.

2528. Do you know that some few years ago, a Drainage Act was passed enabling such a work to be carried out, if a certain proportion of the owners of the property agreed to it?—Yes; but taking into consideration the amount of trouble and expense which it would be to us, we do not consider it worth while to enter upon it. At the same time the land would be very much benefited. I should think as much as a pound an acre.

2529. You think that the rent would bear raising to some considerable amount for the purpose of carrying out the improvements which you recommend?—Yes, I shall be very happy to pay 5*s.* per acre a year for my land to have it drained.

2530. Your experience of the working of the Land Drainage Act is, that notwithstanding the facilities which it affords and although it is desirable you have not been able to carry out the drainage in this district?—I am only speaking of this particular case. We saw so much difficulty in dealing with certain persons, that we dropped the matter at once, we did not go to any expense.

2531. Have you any facts which you can mention to us with respect to the diminution of the water in the river?—Some years ago, my farm happened to belong to some gentlemen who were conversant with the Land Drainage Act. My farm had a good many little springs on it, and they drained all these springs. Those little land springs used to remain till the summer, and used to go into the river, but now they all go away as soon as the rain falls, and that would diminish the amount of water in the river in the summer time.

2532. Is there no water passing in the summer time into the river from that source?—No, except we have a very heavy rain. In the winter time, of course, we have a great deal of water, and as much as we ever had.

2533. Do you agree with the former witness, Mr. Hunt, who stated that the quantity of water passing down is very much less now in the summer time than it was in former years?—Yes.

2534. Do you attribute that to the same causes as he did?—In some measure; but he did not mention the land draining which has been very extensively practised in our district.

2535. (*Professor Way.*) He mentioned that as one of the causes?—That I did not catch. That is one of the causes, and the other causes which he mentioned I have no doubt are very correct.

2536. (*Chairman.*) At what depth do you drain?—Many farmers drain about four feet deep.

2537. Is from four to six feet about the average depth?—Some people average 18 inches, and some two feet, and others three feet, and others four and five feet deep.

2538. At all events four feet would be a deep draining?—Yes, and I think that it is a great deal too deep draining on heavy land, but it is light land where my drains were made.

2539. With regard to the question of diminishing the quantity of water by draining, do you imagine that springs are seated in any section of land which is touched by four feet in depth?—Those are what we call land springs, we get them in at four feet.

2540. Supposing that something could sweep away the four feet of surface altogether, do you not think that you would have the same amount of springs as you have now?—That I cannot say.

2541. Do you not think that that spring water has connexion with a much greater depth than four feet?—These are very small springs. I will describe the nature of the land. We will suppose that there is a cup of clay, as is the case in some of my fields of two acres in extent, and in that cup there is a bed of gravel, the water cannot get away when it rains,—there it is. If you take a four feet drain through it, it goes nearly to the bottom of the gravel, and the water goes right away. As an example, I could point out a land ditch which generally begins to run in the month of November, and continues to run till about the middle of May.

2542. You can take away that water which rises to within four feet in depth?—Yes. I have spoken as to the effect upon my land and not the effect upon the river. It is only consequential.

2543. It takes away on your land water to the extent of four feet, and it passes it on to the river more quickly than it did before?—Yes.

2544. (*Professor Way.*) The instance which you give is one of the worst which you could select, because it is not the case of a spring but the case of water logged land. But supposing that you had a hill-side of gravel upon clay, the water would come out for months together, solely drawn from the superficial gravel, is that what you mean?—Yes. Sometimes the land crops out in gravel, and sometimes it crops out in clay, and what we call the four feet drains take a great quantity of water away.

2545. (*Chairman.*) Is there anything further which you wish to state?—No.

The witness withdrew.

Mr. Thomas Garratt (Hunsdon) examined.

Mr. T. Garratt.

2546. (*Chairman.*) Are you the proprietor of Hunsdon Mill?—I am the tenant of Hunsdon Mill.

2547. Where is Hunsdon Mill situated?—On the river Stort, about eight miles below Bishop Stortford.

2548. Down the river?—Yes. Roydon Mill is the mill below, nearer the Lee, which empties itself into Lee, it being upon the Stort, about four miles below Harlow.

2549. How long have you occupied that mill?—I occupied Roydon mill before I took Hunsdon mill; I have lived immediately on the Stort about 15 years.

2550. What number of stones can you ordinarily drive there?—There are six in the Hunsdon Mill, but the water of late years has come so irregularly that we frequently have water sometimes more than the mill will take, and at other times we have not more than enough for about two or three pairs of stones. It averages about three pairs of stones in summer, but now there are considerably more.

2551. Do you mean three pairs of stones, with cleaning and dressing machines?—No.

2552. Do you use steam power?—Not on the Stort, but on the Chelmer I do, where I have a mill in partnership with my brother.

2553. What is your fall?—Between 13 and 14 feet at Hunsdon. It is the highest fall on the whole river.

2554. What horse power do you use?—From about 24 to 26 horse power.

2555. What is your horse power when you have the least volume of water?—About 12 on the average. It is about half. I consider that I can do barely half as much in winter as I do in summer, because I am flooded in winter for days together. It is an overshot wheel.

2556. What diameter is your wheel?—14 feet 8, and it is about 12 feet high.

2557. Have you only one wheel?—Yes. I formerly worked two, but I had an overshot wheel put in lieu of a breast wheel some years ago.

2558. In what condition is the river ordinarily?—In a very bad state.

2559. Do you mean bad as regards the quantity of the water, or the condition in which the river itself is?—Both as regards the condition of the water, and the dirty state of the mud at the bottom, so much so, that about eight years ago it was a pure stream, and being in the habit of keeping trout where I come from in Hertfordshire, I introduced trout into the river, and I fed them till they were about 4 lbs. or 5 lbs. weight; but about four years ago the water came down in a green filthy state, and the whole of my trout died. The mud has come down by the barges. My water after it leaves the wheel is a private water for about three fourths of a mile to a mile, where there is no navigation, and the mud settles there to a great extent. I find that other people send the mud to me, and I had a large hoe constructed, and I put four horses to it, and I sent the mud down again into the navigation. It is cheaper than throwing it out.

2560. Can the persons below find any fault with you for doing it?—We occupy the mill below.

2561. What do you do at that mill below?—We drive the mud away in the best way we can. We have had iron harrows, with two or three horses. In some places a barge comes down on Sunday when my mill is stopped. The River Lee Company do not allow the navigation to be opened on Sunday, and the barges run up on the Saturday night to get to the mouth of the Stort before the river closes, and the others come down to get to the mouth of the Lee by the time that it is opened on Sunday night, and the mill standing still, there being no fresh water, it is just like a ditch, and the fish frequently come to the top of the water on Sunday from sickness.

2562. Has the condition of the river been getting better or worse since you have known it?—Decidedly worse.

2563. It is getting worse every year?—Yes. There is not a house near the river but what drains its sewage into the river the whole of the way up. Farmyards and other houses do so.

2564. In what condition do you occasionally find the surface of the water?—It is covered with green scum like a pond.

2565. Are there the carcases of dead animals floating on the surface?—Yes, frequently; and unfortunately, about three weeks or a month ago, I found the body of a dead child floating on the surface.

2566. When you find the carcases of dead animals, what do you do with them?—I push them through the gully hole.

2567. You do not bury them?—No; they would stink too much for that.

2568. What became of the carcase of the poor child?—I sent immediately for a policeman, and had an inquest held upon it.

2569. Was it found out where it came from?—No. There was an open verdict, "Found drowned." The child was about 24 hours old.

BISHOP STORTFORD.

Mr. T. Garratt.

14 Dec. 1866.

2570. As the sewage of the towns and villages and of the individual houses comes in, do you ever see human ordure floating upon the water?—I cannot detect it.

2571. It gets broken up?—Yes, from the wheels disturbing it. It is at times more like churning up mud than anything else. I have frequently seen a barge come down and there has been a foot of mud. It shoves it down to the navigation, and there is a channel which drives it down to the head of the mill, and I am obliged to remove it in the best way that I can.

2572. Does it ever affect you or your men with sickness?—I have a pretty good constitution, and I do not think that it affects me.

2573. Where do you get your drinking water from?—From a well, and if the well is out of repair I send nearly a mile off for water for the use of the house.

2574. You do not think of drinking the river water?—Not in the least, and two years ago it was in such a state that my horses would not drink it, but that was only for a few days from the refuse of gas-works, or something of that sort.

2575. Do you think that it is a proper water to send on for the people of London to drink?—Decidedly not.

2576. If any improvement can be made so as to restore it to a pure condition I suppose that you think that it ought to be made?—Yes. The whole of the streams would be very pure water barring the pollution which comes in.

2577. If the springs were kept pure you think that the water coming to London would be pure water?—Yes.

2578. If they did that they would take certain water past your mills?—Yes.

2579. I suppose you would think that that should be compensated for?—I do not see why one individual should monopolise the whole to the detriment of thousands.

2580. I suppose that most of your mills are water mills?—Yes; those on the Stort.

2581. What is the rent of your mill?—The rent of my mill is 310*l.* a year with the land, and the tollage on the lock. I value the mill and the machinery with it, without the grounds, at 240*l.* or 250*l.* We have very good grounds. Nearly the whole of the machinery is mine, in addition to that.

2582. Any scheme which contemplated buying up the mills for the purpose of carrying out these improvements must face a very considerable outlay?—Yes.

2583. For instance the purchase money of a mill like yours would amount to a very good round sum?—It was purchased some few years ago.

2584. 5,000*l.* or 6,000*l.*?—It would not be worth that without the house and the grounds.

2585. If any scheme contemplated sweeping away the mills for the sake of a good water supply for London, it would come to a good round sum?—Yes; and I have always advocated that it would pay. The mills now are often flooded.

2586. An area of land is now back watered, and the annual value of water-logged land is much greater than the annual value of the power?—With the exception of a few instances in Hertfordshire, I consider that the mills cause more detriment to the land than they are worth. My family work two mills on the Lee and two on the Stort. My family occupy one on the river Ash and one on the Mimram.

2587. Is steam used at all in this part of the country for supplementing mill power?—On account of water falling-off some four or five years ago we hired another mill with 13 pairs of stones on the Chelmer to make up for it; six being worked by steam, and seven by water.

2588. Have you ever used steam for grinding?—I do so now on the Chelmer.

2589. Is there anything in water power which gives it an advantage in driving your machinery as compared with steam?—There is more wear and tear with steam power than there is with water power, because there is the friction, but in my opinion it makes very little difference if we had a full supply of water, cold water was the cheapest; but situated as we are, if we cannot do more than half our power, water power is very little cheaper than steam power. My family now occupy with water and steam upwards of 40 pairs of stones, and I think that 20 pairs of stones with steam would do more than 40 with water. When Monday morning comes and we make sales for 500 or 700 sacks of flour we know that we can do it in a certain time, but with water perhaps there may be a flood to-day and we are standing still, and to-morrow we have no water. At the mill at Hunsdon I have stood still for want of water at 9 o'clock in the morning, and before 9 o'clock next morning I have stood still from a flood, and that is within a fortnight of the present time.

2590. Then we have these facts; you find the river itself, you think, from some cause or another, to be more uncertain in its volume than it used to be?—Decidedly.

2591. You have the water getting much more impure than it used to be?—Certainly.

2592. You have greater deposits of mud than you had formerly?—Certainly.

2593. And you have large areas of land water-logged most injuriously by reason of the mill dams which are existing?—I do not think that at the lower part where I occupy, after a flood, if you lowered the river one yard, you could stop it from, at times, overflowing the banks.

2594. But you could easily bank the river in; you could raise a parallel bank which would keep the land from being water-logged?—I think that you must first of all see to the river the whole way. The Stort is the floodiest stream running into London. My water wheel is frequently from six to seven feet in tail water when I am standing still for a flood.

2595. Of what length is the weir?—About 22 or 23 yards in the widest part.

2596. If your mill were to stand in dry weather, what depth would the water come over it?—I frequently have to stand seven or eight hours when the water will not rise an inch. The other mills shut down at nights, and the water is frequently running over the banks for the whole of the day, and then the mill stands still after the others have stopped.

2597. What with the water wanted for the canal, and the water ponded by the other mills, and let down by the other mills without any consultation with you, you cannot tell what you will be able to do?—Just so.

2598. And yet the Stort is liable to very rapid floods?—I think that there is scarcely a river in England which is so subject to floods.

2599. Can you give me any idea of the height to which the river would rise in the middle of one of your ponds when it is in flood?—Our lands are frequently three feet under water besides what the gates will take.

2600. (*Professor Way.*) How much is the river below the banks?—Not more than about eight inches, but the valley is so low below that it fills the valley, it takes a sweep right down the valley, so that four-fifths of the water comes right down the meadows and over the roads.

2601. You know that very mischievous floods very frequently come down which you cannot control?—Just so. I do not think that you could construct banks high enough to carry them over, unless you went with the natural valley of the river. My mill is carried along a side hill, and when the banks overflow the valley is filled up. The original river Stort is now nothing but a dry ditch. I have no doubt that the old valley might be constructed to carry the whole of the water. If you swept away all the mills and opened the valley, you might carry all the water away without any difficulty.

2602. I suppose you need not sweep all the mills away if you replaced the water by steam?—You could not do that in the case of my mill at Hunsdon, it would be useless, for it is three miles distant

from a railway station. You had better pull down the mill and build it elsewhere.

2603. (*Mr. Harrison.*) You have two mills, one at Roydon and another at Hunsdon?—My brother-in-law lives at Roydon.

2604. Do you receive anything from the navigation?—Yes.

2605. How much do you receive for each lock of water passing the navigation?—Under the original Act it was 6*d.* a barge, and we had to let the barges through. After that, there was some arrangement with the proprietors of the river Stort and the mill-owners, that they should give 10*d.*, collecting a shilling, and should retain 2*d.* out of every shilling towards the labour of letting the barge through.

2606. At what mill is that?—At all the mills.

2607. A former witness stated that it was 6*d.*?—I have the 6*d.*, but I return one penny to the lock-keeper employed for the Stort proprietors; the 10*d.* and the shilling apply to the journey up and the journey down; there are two locks. I maintain that if there was a fair compensation for the loss of water I ought to have four times as much as the other mills do; it takes double the quantity of water to fill my lock that it does to fill the locks of my neighbours, and the water is of double the value to me.

2608. Is the 13 feet fall at your mill the same now as it was before the navigation was formed?—I believe that it is exactly the same.

2609. At what time of the year was it that the refuse which you have mentioned came down and killed your fish?—In the summer, in July and August. We always consider that there is the shortest water in the Stort as soon as the grass is cut, because there are so many ditches and water courses on the Stort which are affected after the grass has grown; there are a great many flags and, the sun having considerable power, they draw out the water into the atmosphere. When vegetation begins to cease we have more water.

2610. You have mentioned that the refuse collects; have you much of it in your tail race?—No, it is not so deep there; for the bed of the river is gravel and shallow.

2611. You mentioned that you obtained some water from a well, where is that well?—That is in my own house, and if the pump was out of order, rather than use the Stort water, I would send a mile for water to a spring.

2612. Do you think it desirable that the river should be put under some government, so that these evils which you speak of might be remedied throughout?—It wants some alteration.

2613. Do you think that it should be done at a system?—It would be for the benefit of the community at large. I think that it would be a detriment to occupiers of mills like myself, but for the community I maintain that it wants a different system altogether.

2614. Do you think with the last witness that the benefit to the land from the arterial drainage would be such as would bear the expenses necessary to carry out the improvements?—Higher up the stream it might be so, but with me as soon as the water is gone the land is so porous that I could plough it to-morrow, and it is so till you get to Stanstead marsh which Mr. Hunt has alluded to, and then it is bad. I consider that the floods are a benefit to me personally, but in places they are a great detriment.

2615. In parts of the river where rushes are growing, do you think with the last witness, that the benefit derived from arterial drainage would be equal to 1*l.* an acre?—I know the land which Mr. Barnard alluded to well, and it would be a great improvement.

2616. Is there much land in the valley of the Stort which would be considerably improved?—In Hallingbury it is very bad, it is a good deal flooded; but where I alluded to was on the Mimram, and there I believe that the mills are a great detriment. I refer to the neighbourhood of Welwyn.

2617. (*Professor Way.*) On the line of the Great Northern railway?—Yes, the Mimram is the purest stream which runs into London. I never knew that water the whole of the time fall below its banks. Whitwell is a place where nearly all the privies hang over the water, and in Welwyn the whole of the sewage runs in.

2618. (*Mr. Harrison.*) One of the former witnesses mentioned a number of mills which had had water power some few years ago, and which, in consequence of the diminution of the water, had been abandoned as water mills, are you aware that that is the case?—The water power is abandoned in this way: there is a mill which has been in my family for upwards of 50 years that is dry for three or four months at a time, but steam power is added to it; there are several mills in my family to which steam power is added. I maintain that the whole of the mills from Whitwell to Hertingfordbury, on the Maran or Mimram, do more harm than they are worth; there are about eight mills there, and I should think that the average of them do not make more than from 50 to 60 sacks of flour a week in the summer time. There are two mills on the river Lee which scarcely have any water; there are about 400 feet on the river Lee, from the source to the mouth.

2619. (*Chairman.*) That is from Houghton-Regis?—Yes.

2620. It is about two miles above Luton?—Yes; the mills have been dry for months together there in summer time. When I was a lad at home I took the height of all the mills from the source of the Lee, right down the Lee, and I calculated that there were about 400 feet.

2621. What is the number of mills?—There are about 12 or 13 mills on the river Lee above Hertford.

2622. In dry weather what amount of flour would those mills grind on the average?—Below Wheathamstead 100 sacks a week, and above Wheathamstead about 50 sacks.

2623. (*Professor Way.*) Do you know the river Stort and Lee sufficiently to give us an account in writing of the mills on them?—Yes, I know every mill from Luton to London, and every mill on the Mimram from the source to London.

2624. (*Mr. Harrison*) And the Bean and the Ash?—Yes, and I can give the fall to each mill. There is not a mill on the whole stream but what I have seen.

2625. (*Chairman.*) We shall be obliged to you if you will furnish us with that information?—I will do so.

2626. Is there anything which you wish to add to your evidence?—I think not.

The witness withdrew.

Mr. William Gee (Bishop Stortford) examined.

Mr. W. Gee.

2627. (*Chairman.*) What are you?—I am a solicitor, and I am clerk to the highway board of the town of Bishop Stortford.

2628. Under what authority is the highway board acting?—Under the General Highway Act of the 3d and 4th of William the Fourth.

2629. Then you have not adopted the new Highway Act for consolidating the previous enactments?—No, the parish of Bishop Stortford has just adopted the Local Government Act.

2630. What is the area of the parish?—I cannot state.

2631. Is the area of the parish and of the township the same?—Yes.

2632. Does the parish include a considerable acreage of agricultural land?—I really do not know, but I should imagine 2,000 or 3,000 acres.

BISHOP STORTFORD.

Mr. W. Gee.

14 Dec. 1866.

2633. Do you know what length of highways you have to maintain?—Eleven miles. We shall shortly have some more highways on account of the expiration of the turnpike trusts.

2634. When did you adopt the Local Government Act?—On the 25th of October, I think, and it will come into force on the 25th of December. I think that the time for appealing has now expired.

2635. Have you had any inspector down here?—No.

2636. Do you know what number of members you are going to elect as your local board?—Fifteen.

2637. You have settled that?—Yes, we have settled that at a meeting.

2638. The qualification will be settled by the Act?—Yes.

2639. It will be, I suppose, 500*l.* property, and 15*l.* rateable value?—Yes.

2640. You are under 10,000 in population?—Yes.

2641. Your population is about 5,000?—Something over 5,000.

2642. What have been the difficulties which have prevented your carrying out any sanitary measures as a highway board; have they been legal difficulties?—We object to any considerable outlay of money. I believe that at present we have no borrowing powers as a highway board.

2643. Are you pretty well acquainted with the Local Government Act?—I have had no practical experience of that Act.

2644. As a lawyer have you looked over its provisions?—Yes.

2645. Have you had any legal decisions as to what it can do and what it cannot do for you?—No, we have not gone into it generally. We have had two public meetings.

2646. Has the question been at all raised of the chance of excessive outlay?—Yes. I think that there is a fear on the part of the ratepayers that it may lead to a large outlay.

2647. Do you think that the ratepayers would be at all assured if they knew that an outlay which would be burdensome and would not give any benefit for the expenditure need not be contemplated?—I have endeavoured to impress that upon them.

2648. That if you manage your affairs as you ought to manage them, any rating or outlay will really add more than the money expended to the value of the property of the town?—Yes.

2649. If you have better streets you have better means of getting over them. If you have sewers and drains which are properly devised, you ought of course to have more comfort and better health, and less poor's rates?—Yes.

2650. And if you have a water supply you can give facilities which you cannot possibly possess where you have no water supply?—There is no doubt of that, but the great bugbear is a great increase of rates.

2651. Have you had any discussions amongst you as to what the sewerage might cost if properly executed?—We have had no definite estimate at all.

2652. Have you had any sum mentioned?—There was a scheme of drainage proposed in, I think, the course of last year, of which the estimated outlay was about 5,000*l.*

2653. That is about 1*l.* per head of your population?—Yes. It was rather an indefinite estimate; no particulars of measurements had been gone into.

2654. You have no debt, I suppose, now upon the township?—No.

2655. You expend the rates which you levy annually?—Yes.

2656. What amount of rate have you levied as a highway board?—Varying from 6*d.* to 10*d.*, and I believe that this year it has been 1*s.*, but I think that we shall have a little surplus from it.

2657. Are there any exemptions now from the rate?—No; we rate the whole parish.

2658. Does the land pay equally with the town property?—Yes; for all purposes of the Highway Acts. It is exempt from the lighting rate, with which, as a highway board, we have nothing to do.

2659. You have adopted the Lighting Act so far as enabling you to light the district?—Yes; there is a separate board of inspectors.

2660. Will all that be incorporated under your new local board?—Yes.

2661. At present where does the sewage of any drains or sewers which you have empty itself?—Into the river.

2662. Into the river which goes on to London?—Yes.

2663. Have you had any complaints from parties below, from millers, or owners of property, of the fouling of the river?—Yes. I think that the only formal complaint is the one which was brought forward by Mr. Barnard this morning. He read the requisition which he sent to the highway board. That was in the course of last year. That complaint was principally by the inhabitants of Sawbridgeworth.

2664. Complaining of the nuisance which is sent down to them?—Yes. At the same time they themselves drain into the river.

2665. And they send down the sewage to some one below?—Yes.

2666. So that if that system was general you would have people making complaints, and threatening actions all the way down?—No doubt there are great nuisances arising at times.

2667. Are there any privies situate in Bishop Stortford so as to overhang the edge of the river?—Yes, I believe that there are.

2668. Where the soil passes right away into the stream?—I believe that there are such; not a great number.

2669. But there are some few?—Yes.

(*Mr. Taylor.*) There are many.

(*Mr. Miller.*) There are many.

2670. (*To Mr. Gee.*) What measures have you adopted with reference to the nuisance of privies, or pigsties, or nuisances of any kind?—An inspector acting under the board has given notice to the parties in the ordinary way, and has taken such steps as might be necessary to remove those nuisances. A connecting drain may have been necessary; and in certain cases he has done that.

2671. How long have you had an inspector of nuisances?—All the time that I have been clerk to the board, and some years before.

(*Mr. Miller.*) From the formation of the board about 10 years ago.

2672. (*To Mr. Gee.*) What does he get per annum?—He is inspector and surveyor of the highways.

2673. What do you pay him for his services altogether?—60*l.* a year.

2674. What has been the general health of this district since you have known it?—I should say that it is a very healthy town as a rule.

2675. Have you had any outbreaks of fever?—For several years past there have been cases of fever, but I do not think that we have been more subject to it than the neighbouring villages and places of that sort.

2676. Have you ever had cholera?—I never heard of a case here.

2677. Has there been cholera at all in the neighbourhood at any period, above you, or below you?—Not within some miles that I know of.

(*Mr. Hawke.*) In the year 1834 I lost a relative by cholera.

2678. Were there any other cases at that period?—There was only one other instance of cholera, and that case survived.

2679. (*Professor Way.*) Was that case in the same year?—Yes.

2680. And there has been no case of cholera since that you know of?—Not that I know of.

(*Mr. Skipp.*) About ten or twelve years ago there was a bargeman who died of cholera in the town, and it was supposed that he brought it from London.

2681. (*Chairman.*) (*To Mr. Gee.*) Have you as a board anything to do with the house drains—do the parties make application to you for leave to drain into your sewers?—As a rule they are supposed to make

application to the surveyor, but I believe that the sewers are sometimes made use of without any application.

2682. Have the highway board made any new sewers since you have been clerk to the board?—Small additions have been made to the sewers.

2683. I suppose that you would not be authorized to construct what we should call sewers?—No.

2684. They would be drains to carry off the surface water from the roads?—That is no doubt the origin of the drains here. They have since been applied to sewage purposes. On the hills I believe that they answer very well for that purpose.

(*Mr. Miller.*) They are no more than surface drains for the roads.

2685. Of what shape are they?—They are circular.

(*Mr. Glasscock.*) They are all barrel drains.

2686. (*To Mr. Gee.*) As regards the Local Government Act, we may take it that you have complied with all the requirements. Have you received the assent of the Home Office?—We shall receive it when the time for notices of appeal has expired.

2687. And you have not received any notices of appeal?—No.

2688. (*Mr. Harrison.*) The surveyor was asked this morning with regard to the complaints; I think that you have brought the book in consequence?—Yes.

2689. Will you refer to a few of the complaints, so as to give us an idea of their character?—On the 1st of August 1863, "Mr. Marshall Taylor and "Mr. John Miller attended to complain of the "offensive state of the mill below the town mill. "After inspecting the nuisance in question it was "proposed by Mr. March, seconded by T. N. Miller, "and resolved, that the assistant-surveyor endeavour "to make arrangements with Mr. Davis, the superintendent of the Stort navigation, for the use of his "boat and implements to clear the filth from the bed "of the river between the town mill and the navigation, and also in the rear of the steam mill, and at "the outlets of the sewers." Then on the 28th of May 1864,—"Mr. John D. Taylor and Mr. Marshal "Taylor attended to draw the attention of the board "to the state of an open ditch in the rear of the "houses on the north side of Hockerill. A large "quantity of sewage and filth accumulated there, and "ultimately flowed into the brook running by the side "of the causeway, which was thus rendered very "offensive." A committee was appointed to inspect and report, "as to the most effective mode of remedy-"ing these nuisances." That ditch ran into the river.

2690. What steps were taken to remedy that state of things?—The ditches were cleaned out; that was the only thing which was practicable under the circumstances.

2691. (*Chairman.*) And then you had a new start, the same thing repeating itself?—Yes. On the 17th of September, 1864, "it was proposed by Mr. J. L. "Glasscock and seconded by Mr. Hawke, that steps "be taken to cleanse the bed of the river from Rye "Street, opposite Mr. Odams' house, as far as South "Mill Lock." On a show of hands there were three votes for and three against the proposal.

2692. What is the general character of the complaints; have they generally reference to the foul state of the river and the bad sanitary state of some part of the town?—They are principally as to local nuisances.

2693. In all cases they refer to some sort of local nuisance?—Yes. The old river at the mill tail is a very shallow stream, and several sewers are discharged there, and when there is a very short supply of water no doubt a nuisance occasionally arises there.

2694. As you have no power as a highway board to initiate proper works for the future prevention of that kind of thing, you are simply doing that which will require to be done over and over again. I assume that if your board complied with any of the requisitions, or set themselves to work to remedy the nuisance, it would be as bad as ever in a few months?—No doubt, and it would require removal again.

2695. It is a sort of up-hill work which will never end?—No doubt, so long as the sewers discharge there, there will be an accumulation.

2696. (*Professor Way.*) I suppose that small nuisances leading to complaints are not discussed and entered in your book?—Just so.

2697. Your book merely refers to matters of importance?—Yes, which are brought before the board. No doubt a great many of the small nuisances are obviated by the inspector.

2698. Then the general tenor of the book which is before you will be of the nature of important nuisances, and I suppose principally regarding the state of the river?—Nuisances which the inspector did not feel himself competent to grapple with without instruction from the board.

2699. (*Mr. Harrison.*) Without going specially into each case, will you mark the number of cases which you have taken out to bring before this Commission since the last date which you have mentioned?—I have not gone carefully through them. There was another proposal for dredging the bed of the river in October 1864. Steps at that time, I believe, were taken to remove accumulations. It is only in certain parts of this river that those accumulations form.

2700. From that time to the present have the complaints been numerous?—No; several of these cases are a further consideration of the same complaint. I do not think that since that time there have been more than three complaints made to the board as to the state of the river.

2701. (*Chairman.*) May we take it that your highway board has done all that they could within their legal powers?—I think that they have strained their powers.

2702. What number of members generally attend?—Six.

2703. How are they appointed commissioners; is there a qualification?—It is an annual appointment and they must be householders.

2704. Are they elected?—Yes; on the 25th of March.

2705. Are they elected by voting papers in the same way as the board of guardians are elected?—No, they are nominated in vestry.

The witness withdrew.

Mr. James Odams (Bishop Stortford) examined. *Mr. J. Odams.*

2706. (*Chairman.*) How many years have you known Bishop Stortford?—About 27.

2707. Do you reside in it or near it?—I reside in the parish.

2708. Are you a member of the highway board?—I am not.

2709. Has there been any reason why you should not have been so; have you not chosen to act, or have the electors not chosen to appoint you?—They have not chosen to appoint me. I think that perhaps had I put myself forward I might have been appointed, but my business occupations take me so much away from the town, that I could not very well devote the time to it.

2710. Have you noticed the state of the river during the period that you have lived in Bishop Stortford?—I have.

2711. Is its present condition better or worse than it was when you first knew it, as regards foulness?—I think that in the summer and autumn months the state of the river is decidedly worse, and must be of necessity

BISHOP STORTFORD.

Mr. J. Odams.

14 Dec. 1866.

worse than it was some few years ago, when I first knew it.

2712. I assume that there has been an increase of population in the valley?—There has not been a very great increase of population in the valley that I am aware of.

2713. What has occurred to cause the river to be in a worse condition that it was formerly?—The increase of sewage matter thrown into it from the drainage of houses into the stream.

2714. In former periods, I suppose, houses were not drained, and the filth lay around them, or in cesspools, but now they are drained and the drains end in the river?—Yes.

2715. And that has caused the extra pollution of the river?—No doubt of it.

2716. What is the character of the land below on either or both banks of the river?—It varies; there is some very good rich alluvial soil, and there is gravel very near.

2717. Is there any land upon which the sewage of the town could be beneficially applied?—I have no doubt that sewage may be beneficially applied to almost any description of land.

2718. Are there any parts of the town with which you are acquainted where there are nuisances existing such as at Providence Terrace?—I know Providence Terrace.

2719. Is there any cause of nuisance from that terrace?—Occasionally in the summer months. As I have walked from the town to my house, I have noticed an unpleasant odour from the drain which runs across the road to the river at that spot; and the drainage is from the Providence Row Cottages.

2720. What is that drain made of?—I believe that it is a wooden trough drain.

2721. How many houses constitute Providence Terrace?—Eleven.

2722. Does the sewage generally in the vicinity of the river, above and below, get into it in one way or another from houses and villages and places along the river?—I think so, from the whole valley of the Stort, but it does not do so immediately, it percolates through; but I have no doubt that it gets into the river.

2723. Have you taken any part in the movement for the adoption of the Local Government Act?—Not any active part.

2724. Have you considered the question as to whether it would be beneficial or otherwise?—Yes; I decidedly thought that it would be beneficial, rather than that we should be under the superintendence of a board of guardians who reside some distance from the town.

2725. Are you a ratepayer in Bishop Stortford?—I am.

2726. Then if any money is expended and if any rates are levied you will have to pay your share?—Unquestionably.

2727. And I suppose that you have not the slightest desire that there should be any unnecessary rating?—Certainly not.

2728. Have you seen at any time land under sewage irrigation?—Yes.

2729. Where?—I have seen the Craigentinnie meadows at Edinburgh; I have seen the Carlisle works, and I have seen a portion of the Croydon works.

2730. I suppose that at the Craigentinnie meadows you saw Italian rye-grass being grown?—I do not know that I saw Italian rye-grass. I saw a very coarse description of grass, but it was not the true description of Italian rye-grass.

2731. And at Carlisle you saw certain meadows irrigated, and cattle and sheep grazing?—Yes.

2732. What did you think of the grass there?—The grass was very coarse. I believe that it answered the purpose as far as the grazier who hired the land was concerned; but I think that the odour arising from the works was rather objectionable at Carlisle.

2733. Do you think that it was the odour from the sewage or from the proprietor's patent carbolic acid?—It was from a combination of the two, I should think.

2734. The person there professes to use carbolic acid to disinfect the sewage?—Yes.

2735. Have you ever been upon the ground after the sewage has been applied; have you smelt anything disagreeable after the application?—I have not been there immediately after the application, and therefore I have not smelt it. I am told that the inhabitants of Portobello at the present time are very much complaining of the nuisance from the irrigated meadows in the neighbourhood of Leith.

2736. That is near Edinburgh?—Yes.

2737. (*Mr. Harrison.*) When you were there did you go over the irrigated meadows?—I went over the irrigated meadows near to Leith. Not those running to Portobello. There are two portions of irrigatated land. I went over the irrigated land near to Leith. I saw the proprietor, Mr. Scurwin, who has been farming there for many years, and on that morning he had let one acre of his land for 27*l.* 10*s.*, and I was very forcibly struck with the enormous rental.

2738. (*Professor Way.*) Was that the rental of the grass?—Yes.

2739. That is to say, that the person to whom he let it had to take it away?—Yes.

2740. (*Chairman.*) That would be a Scotch acre, which is about one fourth larger than ours?—Yes.

2741. (*Mr. Harrison.*) Did you perceive the condition of the ditches on those irrigated meadows?—Yes, I noticed the ditches. Plots of land intersected the ditches, so that the sewage was put on upon every alternate day, or whenever they thought proper to put it on.

2742. When you visited the property, did you observe any of these ditches with stagnant sewage in them?—No.

2743. Did you perceive any smell when you visited the land?—None at all.

2744. If you had visited the meadows below towards Portobello you would have noticed many ditches which are large, and in which the sewage is allowed to stagnate, and I am satisfied, from inspection, that the nuisance from those irrigated meadows chiefly arises from the stagnant sewage?—I did not visit those meadows.

2745. (*Chairman.*) When you visited Carlisle do you think that you had anything more offensive than you have in an ordinary farmyard?—Decidedly so.

2746. When were you there?—I think that it was three or four years ago.

2747. The proprietor professes to make no stink at all except in his patent carbolic acid?—I believe that he does not.

2748. (*Mr. Harrison.*) When I was there I was particularly struck with the decided absence of smell. Whether the operation was a beneficial one or otherwise in other respects I will not speak so decidedly upon, but so far as the degree of odour from the works went, I thought that the absence of it was carried to a very great extent?—I certainly perceived a disagreeable smell.

2749. (*Chairman.*) When were you at Croydon?—It was three years ago. They had not carried out the plan in perfection there.

2750. Was it at Croydon or South Norwood that you saw the irrigated land?—It was at Croydon.

2751. (*Professor Way.*) I suppose that the power of the soil to deodorize sewage has its limits, and that you may put on so much sewage that the soil has not power to deodorize it all?—I of course bow to your superior judgment; but I should think that some soils would absorb almost any amount of sewage, but of course there must be a quantity running away.

2752. Supposing that the quantity of sewage put on at Edinburgh was more than in proportion to the area of land devoted to it, would not what I suggest be the case?—Yes.

2753. Possibly it is not necessary to repeat at other places what is done at Edinburgh, where comparatively few acres of land take the sewage of a very large population, and therefore that would not be any guide. We are accustomed to say that Edinburgh shows what can be done, but that it is far from a place to be imitated ?—Quite so.

2754. And that the evils of the sewage application there need not be necessarily repeated in any other place, and that therefore it is possible to deal with sewage in other places without any such evils, and that it is done ?—Yes.

2755. The case of Edinburgh is one for the enemies of sewage irrigation, and not for its friends ?—I think that it has a great many friends there in consequence of its success.

2756. (*Chairman.*) Do you know that one element of the dissatisfaction of the people in the neighbourhood of those meadows is that the proprietor is an Englishman ?—I was not aware of that.

2757. The most searching examinations and inquiries have been made in the neighbourhood of those meadows by constituted authorities; for instance, there are some large barracks there ?—Yes.

2758. And examinations were made by the War Office authorities, and the result was that it was found that the troops in those barracks had better health than in any other barracks in Scotland, consequently the accusation that the sewage caused ill health fell to the ground. I know that to be the case, because I was a member of that War Office Committee ?—It is very satisfactory to hear that statement.

2759. (*Professor Way.*) Supposing that it is made incumbent upon this town of Bishop Stortford to divert its sewage from the river Stort, and so from the river generally, which plan would your experience (having seen these places) dictate to you, the plan of precipitation of the sewage or the plan of direct application to the land ?—The plan of direct application to the land decidedly. I think that you had a statement in the evidence given by Mr. Hunt this morning, who told you that the effluvium from the precipitation at Hertford is very noxious, and that therefore the water of the stream must be polluted again.

2760. Have you ever seen the precipitating works ?—No.

2761. Would you be surprised to learn that it costs the people of Luton between 400*l.* and 500*l.* a year for precipitation ?—And when the precipitate is thrown down it is not worth carting away.

2762. (*Mr. Harrison.*) They get something by it ?—I should think that it is very trifling.

2763. (*Professor Way.*) At any rate they are at the expense of 500*l.* a year over and above what they get ?—Yes.

2764. (*Chairman.*) Anything which you precipitate out of washed sewage is of course of secondary importance for agricultural purposes ?—Yes; there is so little of fertilizing power left after the liquid has been removed, and in a commercial point of view it is a great loss to attempt to precipitate it.

2765. At Luton they get about seven tons a day of solid matter, taking six days in the week, which comes to an enormous weight of material, and that is principally road grit. They get nearly weight for weight out of the filter beds, but they put it upon the roads to make the roads, in the shape of stone ?—I think that we should be a good deal troubled by that here. I think that there are many people here who have a prescriptive right to drain into the river. If I understand the drainage of Stortford aright, the new drains are only enlarged old ones.

2766. Is there any further information which you can give us ?—I think not.

The witness withdrew.

Mr. John Poole Davis (Bishop Stortford), examined.

Mr. J. P. Davis.

2767. (*Chairman.*) You are surveyor of the Stort navigation ?—I am.

2768. For what length is the river Stort navigable ?—13½ miles.

2769. Where does it commence, and where does it end ?—The springs which form the source of the river commence about five miles above Bishop Stortford, in the neighbourhood of Elsenham.

2770. And it is navigable to what point on the Lee ?—It forms a small stream till it gets to Stortford. It is navigable from Stortford to a place called Field's Weir, near Rye House, on the Lee.

2771. The navigation begins at Stortford ?—Yes.

2772. What number of locks have you in that length ?—Fifteen.

2773. What is their fall ?—They average about six feet. The whole fall is about 90 feet.

2774. What tonnage can you get up that navigation ?—In ordinary times we carry from 45 to 50 tons. It depends upon the supply of water.

2775. Have you any idea what tonnage goes up and down in a year ?—Up and down our tonnage reaches nearly 60,000 tons.

2776. Is your navigation a separate navigation from the Lee ?—Yes, it is a separate property. The Lee is a trust, and the Stort is private property owned by individuals.

2777. Is it a company ?—It is a firm.

2778. Consisting of how many ?—There are five persons in the firm.

2779. Is it under Act of Parliament ?—The firm who have it now foreclosed a mortgage which they had upon it, so that they got it for a small sum, which is no criterion of the value of the property.

2780. How long have they had it in their possession ?—About 12 or 13 years.

2781. Do you know what the amount of the mortgage was ?—40,000*l.*

2782. For what length of time has the Stort been navigable ?—It was commenced in 1766 and was opened in 1769.

2783. Do you know who was the engineer who formed the navigation; was it Smeaton ?—No. I have not his name at this moment.

2784. Do you know whether Smeaton ever reported upon it ?—I do not know. I have only been connected with it for ten years. He may have done so in the earlier part of it.

2785. In what condition is the navigation now as regards its locks and permanent works; are they in a pretty good condition ?—They are in a very fair condition.

2786. Have you spent much money upon it recently ?—A great deal of money has been spent upon it in the last 10 or 12 years. This is a plan of the drainage of Bishop Stortford (*producing the same*). A great part of the drainage runs into the river before you come to the navigable part.

2787. You have been connected with the navigation for ten years ?—Yes.

2788. Is the pollution any greater now than it was when you first knew it ?—Yes, considerably greater.

2789. At what points ?—We have had two new drains made into the navigation during that time. One of those drains carries all the drainage from the union, and another drain brings the drainage from New Town, and they have added very considerably to the quantity brought into the river.

2790. As surveyor to the owners of the navigation, have you any power to stop drains being put in ?—We have no power which we can act upon. The power is very ill defined. We have on all occasions

BISHOP STORTFORD.

Mr. J.P.Davis.

14 Dec. 1866.

protested against drains being put in, and we have been in communication with the East London Water Works Company to try whether they would aid us in mitigating the evil, but they felt a difficulty in doing so, their Acts are not sufficient.

2791. What is the date of your oldest Act?—We have only one Act, and it is the 6th of George the Third, chapter 78; it was passed about the year 1765.

2792. Have you any dredge boats on the navigable part of the river?—Yes, two.

2793. What do you do with the material which you dredge?—We generally get rid of it to the farmers, some of them take it and spread it on their land, and find it very beneficial, and others dislike it.

2794. It breeds weeds, I suppose?—If you lay it in a heap it will breed weeds just as farmyard manure will, but not if you break it up.

2795. Have you any fish in the navigable portion of the river?—Yes, we have a very great many fish.

2796. Is the river affected by floods to any extent?—We have many floods, our highest floods rise from two to three feet, and they now go off very quickly; there is a system of drainage everywhere; they are more rapid than they used to be, and we get rid of them sooner.

2797. When a flood is at its height does it stop the navigation?—Yes, it stops it for a time.

2798. What distance on either side of the navigable portion of the river belongs to the proprietors of the navigation; do the towing path and the line of water alone belong to them, or have they any further right?—Generally our right only consists of the towing path, 14 feet from the edge of the river; we have much land belonging to the property.

2799. You have separate land belonging to the property?—Yes.

2800. Do you claim to have the right of soil of the bed of the river?—No; we can deepen and scour.

2801. Does it belong to the landowners?—It is supposed to belong to the landowners and the millowners, and so on.

2802. Do the mills belong to the proprietors of the navigation?—No, they existed before the navigation was made, so that the water was always dammed up.

2803. Can they interfere with your navigation; can they pull the water down when you want it?—Yes, and they interfere with us a great deal. We constantly have differences with them about their lowering the water so as to obstruct the navigation.

2804. Does that lead to lawsuits?—We have not been to law, we generally settle those matters amicably.

2805. If you can?—If we can.

2806. Your experience is that you are getting the river fouler than used to be the case?—Yes, in the neighbourhood of Bishop Stortford.

2807. In summer is it sufficiently foul in hot and dry weather to create an offensive smell?—Yes, very offensive.

2808. Do the boatmen ever complain of it?—Yes, all of them; it is very offensive.

2809. Is it offensive when you are dredging it?—Yes, in the neighbourhood of Bishop Stortford. In the very hot weather the sewage rises to the surface, and floats down the river.

2810. It ferments, and comes up in bubbles, and forms a scum on the surface?—Yes, we find that to be the case seven or eight miles down the river, before it is lost.

2811. Are you troubled at all with floating carcases of dogs and cats which are thrown in to be drowned?—Yes.

2812. Does the navigable portion of the river flood the valley on either side during floods?—Yes, the water overflows the valley on each side.

2813. Do your locks, tending to pond up the river water, flood any portion of the valley?—No, above the locks we have floodgates.

2814. At what height do you keep the water as compared with the adjoining land in the flattest parts of the valleys; have you not sometimes your water nearly up to the grass surface?—We regulate our water by the height to which the mills originally dammed up the water, the overshot fixed at that time formed the head of the water mark. Our rights to the water are limited, the mills having a prior right.

2815. Do the men who navigate the river use the water for cooking and cleansing?—They do in the lower parts of the river, but not in the neighbourhood of Bishop Stortford. Besides those at Bishop Stortford there are three drains into the river at Sawbridgeworth.

2816. Have you any list of the mills which there are upon the stream connected with your navigation?—Yes.

2817. Do you remember what their nominal power is, and what they do?—I do not, they are continually altering their power; we know the fall, and so on.

2818. Is the entire fall made available at one point or another all the way down, as far as your navigation goes?—No, we have 15 locks and only 11 mills.

2819. Then you could establish four more mills?—Yes, but we would much rather do away with those which exist than establish any more.

2820. (*Mr. Harrison.*) Have those four mills been purchased by the Canal Company?—No. In making the canal the length of water could be more cheaply dammed up by having additional locks.

2821. (*Chairman.*) Is the navigation fed by any considerable springs during its length which is navigable?—Yes, we have springs coming in all directions; there are very considerable springs about six miles down.

2822. Have you much more water coming down the river than is absolutely required for navigation purposes, and flowing to waste?—Yes, we have a good deal more than is required for navigation purposes. The mills are working constantly as long as they can go, very often night and day, and in addition to the water which they use we pass through from 800 to 1,000 barges each way in a year.

2823. And each barge takes its lock full of water?—Yes.

2824. And one lock full of water goes through the entire navigation?—Yes.

2825. Have you any side ponds to save the water?—No. We should be very glad to have them to save the water, but the works have been made in an economical manner.

2826. Have you any double locks?—No.

2827. If your trade increased you would consider them desirable?—Our trade has increased very considerably, but the increase has not been sufficient to cause us to make double locks yet.

2828. Have you felt the effect of railway competition?—For some years after the railway was opened the traffic upon the canal very much decreased, after that it took a turn, and in the last 11 years it has been increasing every year.

2829. What do you principally carry upon the navigation?—We carry corn, building materials, coals, and flour. We carry manure free of toll for the benefit of the farmers and landowners.

2830. Are you obliged to do that by your Act?—Yes. We also carry a great deal of artificial manure, such as oilcake and sundries.

2831. (*Professor Way.*) Do you carry timber?—Yes, a great deal of timber.

2832. (*Chairman.*) And malt?—Yes. We carry nearly 600,000 sacks of flour and corn in a year.

2833. What is your tonnage rate per mile?—We have no barges of our own. We only charge a toll upon the barges as they pass, and our average toll is about 9*d.* a ton.

2834. Is that for the entire navigation?—That is for the entire Stort navigation, and the river Lee trustees charge a further toll to London.

2835. Does that toll apply to boats, whether they traverse only a portion of the navigation or the whole of it?—No; the rates are proportioned according to the distance.

2836. Is your lock where you regulate the toll near the junction with the Lee?—Yes, it is the second lock from the Lee.

2837. What draught of water have you throughout the navigation?—About three feet six is the average depth.

2838. What are the dimensions of your locks?—They vary in length. They vary from about 104 feet to 90 feet, and they are 13 feet 6 wide.

2839. Then the barges, I suppose, are 13 feet barges?—The barges are about 78 feet long, and about 13 feet 1 inch wide.

2840. Are any of them worked by steam power?—No; they are worked by horse power.

2841. You say that your proprietors have no barges of their own?—They have not any.

2842. Have you ever tried steam upon the river?—No. We have hired steam dredging machines.

2843. But you have not had steam barges for towing purposes?—No.

2844. Have you seen any of the steam barges upon the Aire and Calder navigation?—No. I have seen them upon the Lee and upon the Thames.

2845. What is the ordinary width of your river?—It does not average much more than 35 feet. It is rather narrow for anything of that sort. There is no doubt that that is a very economical way of working barges, if you have room.

2846. At what velocity are the barges generally taken?—About two miles an hour.

2847. If you propelled one of your laden barges at the rate of four miles an hour, I suppose that it would give a great scour to the river?—Yes, it would injure the banks.

2848. And in some instances, I suppose, it would ground the boats—it would throw the water out of the river?—Yes. We have an advantage over the railway company in carrying malt, which is the great staple of this neighbourhood, because malt is a thing which, by friction, decreases in quantity. There is a saving of about $1\frac{1}{2}$ per cent. in carrying malt by water.

2849. That is to say, the motion in loading and unloading and the jarring friction upon the railway would cause malt to weigh less by $1\frac{1}{2}$ per cent. than in carrying it quietly by a barge?—Yes. Many of our malthouses are upon the banks of the river, and the malt is sent to the breweries on the banks of the Thames, so that a sack of malt has only to be lifted into a barge, and it remains quiet till it is taken out in London.

2850. Do you bring many coals up?—No; our trade in coals decreases as the railways get into the coal districts, but we have a certain trade still. Sometimes when freights are low we get more coals, and so on. Of course they come from the Pool. They are all the north country seaborne coal.

2851. Do you think that any plan might be devised for purifying this water more than it is purified at present without injuring the navigation?—My opinion is, that if the sewage of the towns upon its banks were not allowed to flow into the river there would be nothing to complain of. There is no hope for the river in any other way.

2852. It is the sewage which causes the mischief?—Yes, particularly the sewage of Bishop Stortford.

2853. How many bankmen have you upon that length of river?—We have about eight lockmen, but then we have a number of labourers.

2854. They keep the towing path in order?—Yes. The number varies.

2855. They move about?—Yes.

2856. What do you repair the surface of the towing path with; do you at all form the surface upon which the horses travel with gravel and broken stone?—Yes. We use unscreened gravel just as it comes from the pit.

2857. Do you get any gravel from the bed of the river?—Yes, occasionally, but it never binds; it is always loose.

2858. Because it is washed?—Yes.

2859. It has not sufficient loam in it to bind it?—No.

2860. Have any proprietors upon the river a right to dredge or to take material out of the river for their own purposes?—We always take out what we like.

2861. But do any of the owners of property do so?—No. No one else has claimed that right for many years, but our Act of Parliament does not say that we have any right to the bed of the river except for scouring and deepening.

2862. It only gives you a right to the navigation?—Yes.

2863. (*Mr. Harrison.*) We may take the locks to be about 100 feet long and 13 feet wide in round numbers, and the fall of the locks to average about six feet?—Yes.

2864. That would be in round numbers pretty nearly 50,000 gallons each lock full?—Yes, we average them at about 50,000 gallons.

2865. For a lockful of water, what do you pay the miller?—By the Act of Parliament we pay him 6*d.* For this he is required to open the lock on payment of 3*d.* for a lockfull of water, and 3*d.* is paid him for opening the lock itself.

2866. You have said that he gets 5*d.*, and that you have a penny for passing the barges?—Originally by the Act they took 3*d.* for a lockfull of water, and 3*d.* for opening it. By long usage they have got into the habit of taking the whole 6*d.*, and finding it more easy to take it by means of our lockmen than to send their own men to take the toll, they have adopted the plan of allowing the lockmen a penny in the 6*d.* for collecting this amount, so that they only get 10*d.* out of the shilling, but still they get 4*d.* more than the Act intended that they should get, unless they opened the locks.

2867. But in effect they get 5*d.* for each lockfull of water?—Yes.

2868. And for a barge going the length of your canal you have to pay 5*d.* at each of the fifteen locks?—One mill does not charge at all, there is 5*s.* each way paid.

2869. And the millowner gets 60 pence?—Yes; he gets the whole amount, and the terms which he makes with the lockmen whom he appoints for collecting the money are a private arrangement.

2870. You pay 1*d.* for 10,000 gallons of water?—Yes, a penny and a fraction, but according to the Act the payment should be only 3*d.* for 50,000 gallons.

2871. Have you the power of taking all the water, supposing that the traffic increased to such an extent as that you required it?—Yes.

2872. Could you by paying that rate per lockfull divert the whole of the water from the mill premises of the valley?—There is no doubt we could. The miller is bound to open the lock when a barge arrives there, under a penalty of 20*l.*, and no limit is placed to the number of barges, so that I appprehend that we could take the whole of the water if it were necessary.

2873. Making a payment to the millowner?—Yes, 3*d.* per each lock.

2874. (*Professor Way.*) In case you come to loggerheads with the millers you could not keep running the barges up and down?—No. A court of equity would no doubt prevent that.

2875. (*Mr. Harrison.*) For getting a boat down and back again, you pay 2*d.* per 10,000 gallons?—One and one fifth of a penny each way.

2876. You mentioned that a number of these sewers (*pointing to the map*) had been put in of late years?—Two of them.

2877. You heard Mr. Odams mention just now, that he claimed for the inhabitants of Bishop Stortford some vested rights, do you think that they would have any vested right in these new sewers?—I should say that they would have a vested right in the old sewers, but not in the new ones, and therefore when the new sewers have been put in we have protested against them.

2878. Besides these new sewers which are put into the river, is there not a considerable scour washed down from the soil into the basin of the river?—A great deal

BISHOP STORTFORD.

Mr. J.P.Davis.

14 Dec. 1866

is washed away from the banks; the banks are continually wasting, so that a great deal of soil gets in in that way.

2879. Have you any account of the number of tons, much you have dredged out in past years, has it been an increasing quantity of late years?—The firm who now own the navigation have only had possession of it for about 12 years, which is hardly long enough for comparison. It depends very much upon the season; if we have a rainy season, we take very little out; if we have a dry season, we are obliged to take a great deal out.

2879*a*. That would rather point to its being to a great extent the sewage matter which you have to get out, is that so?—We always find that there is an accumulation at the mouth of the sewers, and we find that at Bishops Stortford it fills up much more than at any other part of the river.

2880. (*Professor Way.*) You have mentioned that there is a decrease in the quantity of the malt by carrying it by railway?—Yes, in the measurement by the bushel.

2881. That does not mean by weight?—The lost particles of malt diminish the weight.

2882. Do not they remain in the bag?—Yes, but they are not used in making beer.

2883. Does the malt sell for less money?—Yes.

2884. Practically you know that that is the case?—I have been so informed by maltsters in a large way of business. Some maltsters make the difference the amount of the rent of the malthouse, and others say that it is about 1½ per cent. The ordinary load of one of our barges is 600 sacks of pale malt, or 800 sacks of brown malt. The loss in this quantity if carried by railway would be nine sacks of pale or 12 sacks of brown malt, when the malt passed the meters in London.

2885. From what does it arise?—It is from the carting of it into the station, and the shaking of it in the train, and its being carted again.

2886. (*Chairman.*) You have been asked with regard to the quantity of the dredgings which you have taken out of the river; has the same amount of power been used within the last two or three years, between the town of Stortford, and the South Mill as has been used in previous years; have you used the same exertions to cleanse the river between those places recently as you have hitherto done?—We keep an account of the quantity taken out of the river, but it is very difficult to answer a question of that kind in a general way. If you asked me the difference between the quantity taken out in 1855 and the quantity taken out in 1865, I could, perhaps, state it from my books.

2887. But you can state whether your expenditure between Stortford and South Mill in the last three years has been as great as, or greater, than it was previously?—I should say that in the last three years we have not taken out so large a quantity as usual.

2888. But you have been understood to say, that the sewage of Stortford has very much increased?—The town has had it under consideration on several occasions lately to clean the river in the neighbourhood of the town itself, and on one or two occasions I believe it has been ordered to be done, but has been postponed, and that has rather hampered us in our arrangements; besides which, as the town has insisted upon putting drains in against our protest, we have felt it desirable not to do work which we should do under other circumstances.

(*Mr. Miller.*) Mr. Davis will bear in mind that the highway board have requested applications to be made to the navigation company as proprietors to assist them, which applications they have resisted from time to time.

(*Witness.*) We protest against these new drains, and they keep insisting upon putting them in, and then they ask for 100*l.* from us to take the deposit out of the river again.

2889. (*Chairman.*) We have this broad fact, that the sewage gets into the river, it causes a nuisance, it occasions a deposit, and the river people have more or less to take it out?—Yes.

The witness withdrew.

Mr. W. R. Hawkes.

Mr. William Robert Hawkes (Bishop Stortford) examined.

2890. (*Chairman.*) You are a maltster and brewer?—Yes, and a wine and spirit merchant.

2891. Where is your brewery situated?—In Water Lane, Bishop Stortford. It is sometimes called Back Lane.

2892. What quantity do you brew?—From 8,000 to 10,000 quarters.

2893. Where do you obtain the water for brewing?—From an artesian well on the premises.

2894. Does that artesian well go into chalk?—Yes, ultimately into chalk.

2895. Of what depth is it?—210 or 220 feet.

2896. Is it truly artesian, does the water rise above the surface?—It is not truly artesian.

2897. It is a bore hole with a well on the top of it?—I should think so; it was made many years ago, before I was connected with it, and therefore that is a question which I cannot answer, but I understand that in a well which is strictly artesian the water flows to the surface, and over the surface from the orifice.

2898. What volume of water per day do you pump from your well?—I cannot answer that question. When we are refrigerating, for instance, probably three barrels a minute would pass through.

2899. How many gallons are there to a barrel?—Thirty-six.

2900. (*Professor Way.*) That is for the surface refrigeration?—By passing cold water.

2901. By pipes?—Yes.

2902. (*Chairman.*) Is the water good water for your purposes?—The water is hard, but there is a difference of opinion, which has been expressed here to day, amongst brewers and others, as to whether hard or soft water is better or worse.

2903. Does not it rather more depend upon what you want to brew; whether you want to brew dark coloured ale or light coloured ale?—I have no doubt that soft water would extract more colouring matter than hard water.

2904. Is not the Burton water hard?—I suppose so.

2905. What number of men do you employ upon the premises?—From 30 to 40 of all grades.

2906. Have you privies?—There are two privies; they adjoin.

2907. Where does the refuse from the privies go?—Into the river.

2908. Have you many horses?—Yes.

2909. Does the drainage of the stables go into the river?—No, I should think as a rule not; some of it undoubtedly does.

2910. Where does the waste water from cleansing the utensils and barrels go?—It goes entirely into the river, but you know what the nature of that cleansing is.

2911. Do you cleanse a great many of the barrels by steam jet?—No.

2912. Is not that process used as a cleanser and sweetener?—Yes; we use it in some cases, but as a rule we do not make use of that apparatus.

2913. Have you formed any views of your own as to what should be done with the river to purify it?—I can scarcely say that I have. No doubt, from the refinements of modern civilization, which have resulted in the watercloset system, the river is worse than it was from more of the excrement getting into it; but what is going to be done with the river

I cannot say, and I have not gone a great deal into that question.

2914. Do you carry principally upon the river or upon the rail?—We principally carry by means of our own horses and waggons.

2915. You do not export?—No, not to any extent.

2916. (*Mr. Harrison.*) In pumping the water from your well, is the quantity which it delivers from the bore holes such that your pump does not much alter the level of the service?—That is a question which I cannot answer; it is all covered in.

(*Mr. Nash.*) When it was first done we could not lower the spring by applying three different appliances; there were hand pumps.

2917. (*Mr. Harrison, to the Witness.*) At what height below the surface of the ground did the water stand in the ground when the spring was first tapped?—When the well was made it was dug down into the chalk, and a seven inch cylinder was let down, and when they cut off the smaller cylinder the water flowed into the larger cylinder which we call the well. When the pumps were applied to it, we could not reduce the head at all, it was an immense quantity of water.

2918. What height was it?—It was about 20 feet below the surface, but that is not very much from the level of the river.

2919. (*Chairman.*) What was the size of the bore hole by which the water came up from the chalk?—About nine inches, but I am not sure about that.

2920. You are sure that it comes from the chalk?—Yes; I should think that it is about 150 feet in the chalk.

2921. (*Mr. Harrison.*) Do you know the level at which the water stands in that well at the present day, as compared with what it stood at after the completion of the works?—No, we have had no opportunity of judging of that.

2922. (*Chairman.*) For anything which you know, I suppose that it is at the same level as when you first started it?—Yes, as far as we can judge.

2923. (*Mr. Harrison.*) The information which we have had to-day would go to show that it probably might stand at a lower level than it did?—Possibly it may.

2924. (*Professor Way.*) At what depth were your pumps put?—I do not recollect now, but we have never had anything like a deficiency of water since we have had that well.

The witness withdrew.

Mr. George Perry (Bishop Stortford) examined.

Mr. G. Perry.

2925. (*Mr. Harrison.*) You are the manager of the gasworks in Bishop Stortford?—Yes.

2926. How long have you been so?—About 24 years.

2927. How long have the gasworks been established?—Since 1835. They have been twice enlarged during my supervision. They are situated at the south end of the town on the banks of the river Stort. I should think that the site is about one third of an acre.

2928. Is there any refuse from the gasworks which passes into the river?—None whatever; we have not a single drain at this time communicating with the river, neither have we had a foul water drain communicating with the river in the last nine years. I had it nine years ago, but in consequence of the frequent complaints of persons living on the banks using the river, and other persons, I cut it off, since that time I have evaporated the foul water under the ashpans.

2929. So that now you can positively state that no foul matter passes into the river from your works?—None whatever, except what is occasioned by the ordinary rainfall washing our premises. It is impossible to keep the yards and places exempt from ammonia, and when there is a rainfall a small quantity of the surface water will find its way down into the river. If we turned the ammoniacal liquor into the river and had a disposition to conceal it we could not do so, because it would be patent to everybody who passed by us. If the waste was turned into the river it would render the water from the works opaque all the way down to South Mill. If you take a tumbler of clear water and only take a straw and dip it into ammonia and put it into the water it will become opaque.

2930. All the products of your gasworks are now so valuable that there is an abundant demand for them, and you dispose of them?—We find it rather an expensive thing for us to store the ammoniacal liquor. We, of course, store our tar as much as we can. A great deal of it is used for rough buildings and agricultural buildings.

2931. (*Professor Way.*) And for boats?—Yes, some of it for boats, but the great bulk of it is taken away for making creosote and other articles in London.

2932. (*Mr. Harrison.*) When it is used on boats, is it not mixed with pitch?—I think that it is rather mixed with Stockholm tar.

2933. Would it be liable to defile the water?—Whenever the vessel passes up and down the river it breaks out in a few illuminated particles on the top of it, and that is the result.

2934. Then you think that any person observing that kind of thing upon the river might mistake it as coming from your works, whereas it possibly comes from a barge?—Yes.

2935. (*Chairman.*) What number of retorts have you now?—21 at work.

2936. What is your make of gas?—About 6,000,000 cubic feet in a year.

2937. What weight of coal do you use?—About 600 tons.

2938. At what price is gas selling here?—5*s.* per 1,000 cubic feet.

2939. For private consumption?—Yes.

2940. And are the lamps by agreement?—Yes, 3*l.* 6*s.* 8*d.* a year each, the company supplying the lamp and keeping it in order, and lighting it and putting it out.

2941. And do you supply the post?—Yes. That I believe is a cheaper rate than gas is supplied at under similar conditions in any town in England, or in any town in this part of the country.

2942. The gasworks belong to a company?—Yes.

2943. (*Professor Way.*) That is 5*s.* a head upon the population for that quantity of gas?—Possibly so.

2944. (*Chairman.*) I assume that gas is used very largely in the malthouses?—No, it is only used for the purpose of lighting.

2945. (*Mr. Harrison.*) From what quarter do you get the coal?—From Newcastle.

2946. How is it brought?—By the navigation.

2947. It is brought to London and up the canal?—Yes.

2948. What is the price of coal now as compared with what it was when you first were manager of the gas works?—I do not think that we are paying as much for it now as we did by 4*s.*

2949. Do you give the railway company credit for that reduction?—I do not know; I think that the

BISHOP STORTFORD.

Mr. G. Perry.

14 Dec. 1866.

price was reduced before the railway came into operation.

2950. What is the price now per ton?—About 16*s.* 6*d.* in the river. I refer to the price in London.

2951. What is the price of coal now in Bishop Stortford as compared with what it was when you first became manager of the gasworks?—I do not recollect what it was, but my impression is that it is not more than 4*s.* less.

2952. (*Professor Way.*) You have been manager of the gasworks for 24 years?—Yes.

2953. At what time did you begin to preserve the tar; you, I suppose, threw the tar into the river at one time?—It never found its way there unless it was once by accident; it has been most carefully preserved. I myself have sold a barrel of tar for 12*s.* 6*d.*

2954. What does a barrel weigh?—It contains about 28 gallons.

2955. We hear that a ton is worth about 1*l.* in the north?—I have sold three gallons of it for 1*d.*

2956. In other rivers the tar was thrown into the river, after an Act was passed to prevent it?—I should think not, because it was of such great value.

2957. But possibly you had a consumption for it; did you at any time throw it in?—We never did.

2958. (*Chairman.*) Had you a sale for it when you were first connected with the works?—Yes. I think that there is evidence from the gas company's books which will show that the tar has been sold for 12*s.* 6*d.* a barrel.

2959. What do you get per ton for your coke here?—We sell it by the chaldron, 12*s.* a chaldron.

2960. Have you a ready sale for all that you make?—Yes, a very fair sale.

2961. Do you use most of it for your own purposes?—We use fully one third of it.

2962. Then you have two thirds for sale?—Yes.

2963. What dividend is your company paying?—We have paid 7½ per cent. for the last three years.

2964. (*Professor Way.*) Do you get any of your coal by rail?—No, except in one instance.

2965. Do you think that you could get it cheaper if you contracted to get it by rail?—I am not aware of it.

2966. (*Chairman.*) The canal company puts your coals alongside your yard, you have a wharf alongside the side of the river?—Yes, our works are better adapted for the reception of coal by water than in any other way.

2967. Is there anything farther which you wish to add?—Nothing, except that I hope that every publicity will be given to my declaration, and I almost wish that I was allowed to make it upon oath, because I have been so strongly suspected and charged with foul practices upon the river. I take this opportunity of publicly declaring that we have not a single drain flowing into the river, and that for the last two months there has not been a single surface drain from our works flowing into the river, but for nine years our foul drain has been most effectually cut off.

(*Mr. Miller.*) We have an instance in our minute book of the highway board where we had to draw attention to a nuisance from a ditch from the overflow at the gasworks and which was of a most abominable character, and there is always found in the neighbourhood of the gasworks a great nuisance. I do not know how the gas company get rid of their nuisance, whether it is by absorption or by fire from the ash-pits, but we all know, living in that district, that we are very much annoyed.

(*Witness.*) When the foul lime from our works, which is strongly impregnated with sulphur, has accumulated in consequence of not being removed, a heavy rain produces a smell.

2968. (*Professor Way.*) Then you acknowledge that there is a smell, whether by your act or not?—Yes.

2969. Is it possible to make arrangements for that lime to be taken away, and if not bought for you to take it away?—We should not then go to the expense of it.

2970. (*Chairman.*) Cannot you purify it?—No, I do not like the oxide of iron.

2971. Have you never tried it?—No; the late Mr. Mr. Gripper, who was a large shareholder in the Hertford gasworks, where they had adapted their gasworks for oxide of iron, recommended me not to do it.

2972. But is his opinion to be put in opposition to the opinion of the managers of the great gasworks in London, all of whom use oxide of iron?—I have had communication with the City of London Gasworks, and there I think they use dry lime.

2973. They are all altering it into the oxide of iron?—I do not like it.

2974. Have you any children brought into your purifying house when they are suffering from croop or whooping cough?—I have only had one instance of it. A lady brought children down there about two years ago; she paid but one visit to us; she wished to be there when the purifier was opened. I did not go into the place myself, but I think it was too strong for them; they never repeated the visit.

2795. (*Mr. Harrison.*) Was that visit of any use?—I did not hear the result.

The witness withdrew.

Adjourned to To-morrow at 11 o'clock, in London.

Victoria Street, Saturday, 15th December 1866.

PRESENT:

ROBERT RAWLINSON, ESQ., C.B., IN THE CHAIR.

JOHN THORNHILL HARRISON, Esq. | Professor JOHN THOMAS WAY.

Mr. JAMES MUIR, further examined.

2976. (*Chairman.*) At your last examination certain documentary evidence was required which you promised to supply?—Yes; and the first that I promised was an abstract of analyses, by Dr. Letheby, o the water supplied by the New River Company during the year 1866. I have that abstract here, with a detailed return of the last-mentioned analysis.

2977. Have you any other returns to hand in?—Yes; I have also a statement of the quality of the Hertford sewage. A detailed analysis by Dr. Letheby has not yet been made.

The following papers were handed in:

ABSTRACT of ANALYSES, by Dr. LETHEBY, of the Water supplied by the New River Company during the Year 1866.

Month.	Amount of Organic Matter in Grains, per Gallon.	Saline Constituents in Grains, per Gallon.
January	0·30	21·10
	0·40	20·60
February	0·40	20·40
	0·40	20·80
March	0·30	19·80
	0·20	21·20
April	0·20	19·80
	0·20	18·80
May	0·20	17·60
	0·30	18·60
June	0·30	17·90
	0·20	15·90
July	0·16	17·90
	0·20	16·96
August	0·24	17·15
	0·22	16·87
September	0·52	16·80
	0·21	16·17
October	0·28	17·84
	0·31	18·56
November	0·52	20·57
	0·52	19·46
December	—	—
	—	—
Average	0·29	18·67

The samples analysed were generally described as bright and colourless.

DETAILS of last-mentioned Analysis:—

	Grs. per Gall.
Carbonate of lime and magnesia	13·26
Sulphate of lime	2·91
Alkaline chloride	1·02
Alkaline nitrate	1·97
Silica and alumina	0·30
Organic matter	0·52

The samples were perfectly bright, and free from organic tint.

QUALITY of HERTFORD SEWAGE.

The whole amount of suspended matter in the discharge of the Hertford sewers, when least diluted, has been found to be little more than 6 grains per gallon.

Precipitating by about 2 grains of lime per gallon, and filtering through fine gravel, reduced the suspended matter of the said discharge, before its delivery into the Lee, near Ware, to 2·3 grains per gallon, of which 1 grain was *mineral*, and 1·3 grain *organic*.

On the advice of Dr. Letheby (who was applied to on the subject in August last) the proportion of lime employed was increased. It is now *three times* its former amount.

Analysis by which it is intended to ascertain precisely the effect of this additional application of lime has not yet been made.

It is mentioned in the paper last handed in that the examination of the sewage took place at a time when we were using a comparatively small quantity of lime; in August last we applied to Dr. Letheby on the subject generally, and asked him what deodorizers he recommended most, and he stated that he thought we could not do better than increase the quantity of the lime, and the quantity has been increased threefold.

2978. (*Professor Way.*) You now use six grains of lime per gallon instead of two?—We are now using $7\frac{1}{2}$ grains.

2979. (*Chairman.*) Have you seen the deodorizing works at Luton?—I have in a general way some time ago, but I have not minutely examined them.

2980. Have you any control at all over them?—None at all, except by way of complaint. There is that amount of control, which the company has exercised (as I explained on the last day of my examination) more than once.

2981. Your company has not in any way contributed to the efficiency of those works, nor interfered with them?—No, except by calling upon the Board of Health to do their duty.

2982. Are any periodical inspections made of them to see whether they are doing their duty?—I have sent for and procured specimens of the water as it flows from their works without their knowledge.

2983. Have you had any analysis made of those specimens?—No.

2984. Will it not be in future advisable to make periodical examinations and analyses of them, and have them recorded?—Yes.

2985. Can you form any idea as to the amount of the impurity and the kind of impurity that goes into the river at that point from Luton and all the manufactories there?—A great deal of impurity must pass into those deodorizing works, but I have had specimens taken of the water as it has flowed out of the works after being treated, and those specimens were not generally to be complained of from their appearance.

2986. Do you know of your own knowledge what weight of chemicals are used in Luton in the processes of bleaching and dyeing?—No.

2987. (*Mr. Harrison.*) I believe they adopt at Luton the same system that you do at Hertford for deodorizing the sewage?—Yes, but I understood the Chairman's question to refer rather to the impurities.

2988. (*Professor Way.*) Are you aware generally that the precipitating process only throws down the matters already in suspension, and that it does not remove the matters in solution?—I am aware that it does not.

2989. The $7\frac{1}{2}$ grains of lime that you have spoken of would not be enough, I presume, to soften the water?—I think not.

2990. Consequently it is not enough to precipitate lime in solution in hard water?—No.

2991. Therefore it will not throw anything down but the suspended matters?—No.

2992. It is merely a better means of clearing the liquid?—That is all; you will see that after the

LONDON.

Mr. J. Muir.

15 Dec. 1866.

process was conducted some time ago with a small quantity of lime, there remained but one grain and three tenths of organic matter in suspension.

2993. Which you before explained?—Yes.

2994. (*Chairman.*) Have you any control over the sewerage of Bishop Stortford?—None at all.

2995. Do you know of your own knowledge what they have been doing there recently?—I do not.

2996. Do you know that their sewerage goes into the River Stort?—I know that it does.

2997. At Bishop Stortford?—Yes.

2998. The Stort is a tributary of the Lee?—It is.

2999. Is it in any way a tributary to your supply?—Yes; but the bulk of our supply, as I have already explained, or that portion of it which we take from the Lee, is drawn above the entrance of the Hertford sewage. We have legal power to take the water from Tottenham, and we have there a steam engine, but that is hardly ever exercised; the engine has not been at work there for two years.

3000. If there is any impurity passing into the Stort at Stortford, you would get your share of it?—Yes, if we pumped at Tottenham. The chief reason for having a station there was this, in times of very hard frost it has been found that the river channel, especially if there has been a heavy fall of snow, was apt to be choked up, and of course then it would be a convenient thing to fall back upon a source so much nearer home, and pump the water into the Stoke Newington reservoir. Practically we do not use the Tottenham source of supply, and therefore we are not affected by the Stort impurities whatever they may be.

3001. Did you before state how many springs you had control over?—I cannot say whether my enumeration was complete without seeing the notes.

3002. There is a certain number of large springs which you have under your control?—We have the Chadwell spring, a natural one, and several artesian wells sunk deep down into the chalk, which I think I mentioned before.

3003. Do those wells deliver water over the surface?—None of them do. In that sense they are not artesian wells. They are only artesian in the sense of being bore holes through an impervious stratum to reach the chalk below. In some of them the water reaches within three feet of the surface.

3004. If you carried a heading up to such wells as those, you would get a flowing spring?—We should, at a sufficient depth.

3005. That, I assume, would not be a very large volume of water as compared with the entire volume that you use?—I mentioned before that the Chadwell spring had this year delivered as much as 700 cubic feet a minute; I have, since my examination here, taken the average for the year, and it may be put at 500 cubic feet a minute; that is, of the Chadwell spring. I am not quite sure of the minimum, but it is something under 300 feet a minute.

3006. And what is the maximum?—It may deliver as much as 700 cubic feet. The artesian wells, or rather these chalk wells, yield very abundantly.

3007. When they are pumped from?—Yes.

3008. Would it be possible, if sufficient cost was incurred, to bring in a volume of spring water without any surface contamination at all by separate mains and gathering conduits?—The cost would be very great, I am afraid.

3009. Putting that out of the question, and rejecting everything that might stand in the way, abolishing the navigation, and taking possession of the water and bringing it in through brick conduits, do you think you could get a supply of spring water equal in volume to what you supply now from the other conduit?—If you call the water of the streams above Hertford spring water, we could; but if you exclude the River Lee, which is at present a partially polluted stream, and exclude also the Beane, which is not quite so pure as the Mimram, I do not think that you would get the quantity that would be requisite.

3010. I assume that these streams are themselves supplied by springs, and that any contamination they receive is after they issue forth and come into the open channel?—Yes, it is so.

3011. If cost were no consideration, I assume that that spring water might be collected in covered conduits, and brought down to a junction with the main arterial conduit, and so bring the water on to London?—Yes.

3012. Therefore, putting aside cost, and supposing that the object of this Commission is both to exclude from these streams all pollution, and to secure an abundant supply of spring water, what is your opinion?—I believe that the upper valleys of the Lee would furnish beautiful water, and sufficient in quantity for our present purpose, excluding the sewage.

3013. What is the present capital of the New River Company?—I answered that question roughly on my last examination from memory, but I will put in the Act of Parliament in which is mentioned the capital that was settled by Parliament in 1852,—exceeding a million and a half. The company obtained Parliamentary powers in 1852, and also in subsequent Acts in 1854 and in 1857, to borrow money to the extent of 1,000,000*l.* Last session again they obtained power from Parliament to increase their capital by 500,000*l.*

3014. The capital now may be considered as exceeding 3,000,000*l.*?—Yes.

3015. If such works as have been indicated or suggested were carried out, I suppose one might expect that there would be a much larger capital?—It would require a large increase of capital to execute works such as you have mentioned.

3016. I dare say you have seen the projects which have been laid before Parliament for bringing in water to London from enormous distances, from North Wales as one place, and I believe there is another to bring it from the lakes of Cumberland and Westmoreland. Looking at such schemes as these, it being contemplated to use covered conduits, as an engineer, knowing your own ground and your own river and its tributaries, do you think you would have to face anything like an equivalent expenditure to make your water supply as unexceptionable as could possibly be desired?—The expenditure in our case would be nothing like that in either of the other cases you have named.

3017. What you would have to deal with would be works not of a complex character; you would not have nature to control you in any way; you have a gradual fall all the way; you know all the difficulties you would have to encounter, and it would be merely dealing with trade property and proprietary rights as exercised upon the river now?—As a matter of engineering the works would be of the easiest kind.

3018. Looking at what London was when Sir Hugh Myddelton first projected his New River scheme, at its population, its requirements, and its means of contributing to a work of that class; then looking at London now, with its population, its requirements, and its means of contributing, without going into detail, do you think that such a work as I have suggested, viz., that the New River Company should collect spring water and bring it in covered conduits, and distribute it without any chance of contamination, would be a greater work in the present day than it would have been in Sir Hugh Myddelton's day?—I believe it would not be so great a work in proportion.

3019. Taking all the elements into consideration?—Yes.

3020. The population, its ability to pay, and its requirement of water?—I think it would not be so large in proportion.

3021. Looking back to Sir Hugh Myddelton's day, I assume you will agree that then the country was very thinly peopled, that agriculture was in a very rude condition, as compared with what it is now, patent manure was not used to so large an extent, and all the forms of pollution that existed then would have been trifling as compared with what they have grown to?—Yes.

3022. We have now a population growing far more rapidly than before, and taking all those circumstances into consideration, do you not think that it is necessary to deal with this question upon a liberal and great scale?—It is quite my own view that it is.

3023. In making these suggestions I always assume that your company would not have its property sacrificed, but that the company would be dealt with upon liberal terms?—It would be quite the feeling of the directors of the New River Company that some comprehensive scheme of that kind should be carried out, if they could only see their way to an adequate remuneration.

3024. That they shall be treated as honourable men dealing with honourable men, and that their property shall not be dealt with in a spirit of confiscation, but in a fair trading way?—Quite so; if fresh expenses are laid upon them in this way, some new arrangement would of course be necessary to make their returns in some measure proportionate to the additional outlay.

3025. Do you produce a general map showing your scheme of rivers and the area you supply?—Yes, this map which is on a small scale, does that.

3026. Will you put it in?—Yes (*handing in the same*). It shows the metropolitan area of the New River district, and I call it metropolitan, because the company can supply parishes along the course of the river, and this is the metropolitan area of that district (*pointing to the map*), which is coloured.

3027. You have coloured it pink?—Yes.

3028. You say that the company have power to supply the adjoining properties along the whole line of this conduit from Hertford down to the metropolitan area?—Yes.

3029. Have any applications been made to you by the adjoining parties for a supply of water?—Only those have applied who have residences near the river.

3030. The townships or parishes, I suppose, have not applied to you?—I think not; the town of Enfield has waterworks of its own, and that is almost the only town of importance upon the line of the river.

3031. Has Tottenham a supply of its own?—Yes, that is rather out of the line of the river. I may add with regard to Enfield that not only has it its own wells, but it has water from this portion of our river (*pointing to the map*). That loop is kept for their use, and from that loop they take water.

3032. Have you any other documentary evidence to hand in as to the rainfall?—I have gone through my rain gauge returns, and the one that I rely upon is one that I took in conjunction with Mr. Beardmore at Field's Weir, and he will put that in. The other returns are not in so perfect a condition as to enable me to furnish you with them at present, and I am afraid the returns would not be all that I could wish them to be. Another document which I have to hand in is an abstract of complaints made at the office.

The same was handed in as follows:

ABSTRACT of ENTRIES made in the "COMPLAINT BOOK" at the Office of the New River Company during the year 1866.

No.	
182	Complaints of short supply from defect in ball cock, lead pipe, or other apparatus belonging to the tenant.
23	Complaints unfounded, or unaccounted for, supply having been found on inquiry to be good.
19	Complaints of leakage, or other defect, in company's pipes, plugs, or cocks.
17	Complaints of dampness; found on investigation to proceed not from water pipes, but from defective drains, &c.
16	Complaints of waste at adjoining houses.
5	Complaints of want of water through breakage of pipes by sewer and gas excavations.
12	Complaints of want of water from mains or engines being off for repairs.
13	Complaints of deficient supply through service being given at a time of day when draught of other consumers reduced pressure in mains, remedied by serving at a different time.
42	Complaints arising from insufficient size of pipe or cistern, or from time of service not being equal to increased consumption.
3	Complaints of want of water through severance of pipes by adjoining owner.
8	Complaints of want of water where additional cisternage had been put up without notice to the company's servants.
6	Complaints of water being temporarily discoloured by the iron of newly driven pipes.
3	Complaints made to the company from houses not supplied by them.
1	Complaint of supply having been cut off for waste or non-payment.
3	Complaints arising from foul state of consumer's cistern.
1	Complaint entered in error.
1	Complaint caused by defect of meter.
1	Complaint caused by water having become fouled by ferrule defect.
1	Complaint of turncock not keeping proper time.
3	Complaints of want of Sunday supply; said supply given.
5	Complaints of want of Sunday supply; proved not to be required.
1	Complaint in regard to which the company's servants were not allowed to enter house to ascertain the cause.
11	Complaints through want of separate communication pipes.
1	Complaint arising from neglect of turncock.
3	Complaints caused by gas leakage into water pipe.
4	Complaints under investigation.
385	

3033. May this document be made use of?—I think so; we have no objection.

3034. Have you any other return to hand in?—I think not. I think what I have handed in includes all that were mentioned on the last occasion.

3035. (*Mr. Harrison.*) I see, by the return you have handed in, that three of the complaints arose from the foul state of the cistern of a consumer?—Yes.

3036. What control have you over the cistern of a consumer?—We have no direct control.

3037. By whom would the complaint be made?—By the consumer himself, who not having examined his own cistern, and not knowing its condition, nor the cause of the impurity of the water, applies to us; we examine it, and find out that something has got into it that ought not to be there, from the cistern probably being left uncovered.

3038. Not through the medium of your water, but from some external source?—Exactly.

3039. Do you put the cistern to rights in a case of that kind?—No, we only point out to the person complaining what it is necessary for him to do.

3040. In schemes that have been proposed to bring water from the Severn and from Wales, do you know whether it was proposed to carry the water throughout the entire length in a covered channel?—Not to be covered I believe throughout. Mr. Bateman in his report mentioned covering merely where it was necessary.

LONDON.

Mr. J. Muir.

15 Dec. 1866.

3041. Does he explain at all what he considers that to be?—No, but I think he gives representations or drawings in his report of the kind of conduit that he intends in different places to construct; some are to be covered and some uncovered.

3042. Does he point out the cases in which he considers it will be necessary to cover them on account of situation or other cause?—I think not.

3043. Do you think that if you were to collect the spring water above Hertford in different directions, and brought that spring water to the present river at Hertford, that the New River would be a sufficient channel in which to convey water to your reservoirs and without a cover?—The covering of our river would of course make the whole thing more perfect and if you had no regard to cost it would be advisable to do it, but I have made no estimate. I think that the cost of covering the New River from end to end would be a very considerable item in any estimate for new works.

3044. Are there any sources of pollution by which the New River is contaminated between Hertford and the reservoir?—None.

3045. Are any steps taken to prevent pollution getting in in any way?—Much of the channel of the New River is railed in. Where it passes through private property and garden grounds, railing cannot always be applied. There are banksmen in charge of the river from end to end, whose whole duty it is to go backwards and forwards to clear the stream of weeds and to prevent pollution of all kinds.

3046. Might we take the New River between Hertford and Ware, as we saw it, as exhibiting a fair sample of the condition of the New River throughout its entire length?—I think so. In some places the river is prettier and looks even neater than that.

3047. If you maintain the New River as an open channel to convey the water to the reservoirs, would not the expense of collecting the water from your springs and supplying the New River with pure spring water be comparatively small?—The chief difficulty with regard to the collection of water above Hertford I think would arise from the nature of the ground in which the reservoirs would have to be made; the porous nature of the ground and the collection of the water there might be a matter of difficulty. It may be known to the Commissioners that the late Mr. Rendel, in conjunction with Mr. Beardmore, proposed certain reservoirs to be made; one on the River Lee, one on the River Ash, and a third one was to be made on the River Rib. The scheme was abandoned, but Mr. Rendel seemed to think that it was feasible to make reservoirs there. I cannot myself overlook the difficulty of making reservoirs sufficiently water-tight in such a geological formation as we have above Hertford.

3048. Do you think that if dams were run across the valley as proposed, the water would escape by some other outlet?—I fear that. You have heard from Mr. Beardmore how porous the soil is, which is an advantage in some respects, but that advantage would be a disadvantage in my opinion when you came to construct reservoirs upon it. It would make the construction most costly, because so much puddle would be required.

3049. You mentioned the other day, or Mr. Beardmore did, that there were a great nnmber of springs issuing below Ware, between Ware and Waltham Abbey?—There are a great many. Mr. Beardmore's own gaugings and Mr. Simpson's gaugings have shown that the river is receiving an accession in its own bed from some unseen channels, and that the volume of water is increased considerably after it leaves the Ware tumbling bay.

3050. Do you think it is possible for the East London Waterworks Company to obtain their supply from those springs without taking any of the polluted water of the River Lee?—My idea is this, that if you succeeded in cleansing the river of the sewage coming from the places which have been named, it would be of little consequence where the reservoirs were made. If the reservoirs were made lower down the valley, where the nature of the soil would make their construction comparatively easy, and where also you could collect a much larger volume of water, there would be no difficulty in supplying with good water the East London Water Company, as well as adding to the quantity of water the New River Company might take.

3051. You mean after they have reached the London clay?—Yes.

3052. Where there would be no leakage?—Yes.

3053. That would be below the junction of the River Stort, would it not?—Yes. The clay I think comes into the valley above the junction with the Stort, but to obtain the advantage of the Stort water for the East London Company, some of the reservoirs would need to be below that junction.

3054. (*Chairman.*) Do you know anything of that report (*handing the same to the witness*)?—Yes, I have read it.

3055. Were you engineer when it was made?—No, but I was in the New River Company's service. I was not chief engineer, I was Mr. Mylne's assistant at that time.

3056. Perhaps you will be kind enough to look over the description contained in that report of your works as far as it goes, and add to it any further information which you may have collected?—I shall be happy to do so, although I may state that at the beginning of this year a return was made to the Board of Health, which would, I think, in every way answer your purpose, showing how far we have extended the works since that report was made.

3057. Did you draw up that return?—Yes.

3058. Then you speak from personal knowledge of it?—Yes.

3059. Was that return sent in direct to the Local Government Act Office, and at what date?—It was sent in to the office of the Board of Health, I think, in May last.

3060. Was it sent in in compliance with a requisition, or in the ordinary course?—In compliance with a requisition from them.

3061. (*Mr. Harrison.*) In the return you have handed in there are many complaints of want of water where there are additional cisterns; have you a record of all the cisterns to which you supply water?—No. I explained before that the time of the service during which the water is left on to fill the cisterns is always made sufficient to fill the largest cistern on that line of pipe. If, without our knowledge, a cistern has been increased in size very much, the time of the service may be found insufficient, and we do not know of it until a case of this kind occurs, and then we take measures to increase the time of the service to fill it up.

3062. There appear to have been three complaints in the course of the year of the leakage of gas into the water?—Yes.

3063. What is the effect of that leakage when it occurs?—I may first explain that it arises generally from some heavy leakage in the gas pipe near to the water pipe, and when the water is shut off from the service the water drains into the lower cisterns of the houses, tending to cause a vacuum in the last-named pipe. This vacuum is supplied by gas, found in the ground round it, if the water-pipe is defective.

3064. When you shut off the water from a certain district during 24 hours do you find that the pipes in that district have filled in the meantime to any extent with air?—Very often.

3065. How does it get into the pipes?—I suppose it is chiefly drawn into the pipes through the tenants' lead pipes.

3066. Does it collect in your mains?—Not in the mains, because the mains are what we term always charged, and the branch pipes (that run from the mains from which the tenants' communication pipes get water) only are shut off: and those branch

pipes are liable to an accumulation of air to some extent.

3067. Are these branch pipes large ones?—They are generally three and four inches in diameter.

3068. Do you find that the air accumulates in them?—Yes, when they are shut off.

3069. If there was a gas pipe leaking in the neighbourhood, would not the gas be apt to get into those pipes instead of atmospheric air?—Yes, and it does get into them, when there is leakage also in that branch water pipe. The kind of complaint you refer to generally arises when there is a leakage in the gas-pipe and when there is a leakage in the water-pipe near it.

3070. That is a kind of complaint that would not arise if the system of supply were a constant one?—It would not. It must be borne in mind that the cases are very few in which such a thing occurs.

3071. (*Chairman.*) Have you ever considered this point when you are drawing off the water intermittently, whether it would be difficult to invent a reversing valve that should fill the main so as to prevent it sucking from any foreign source?—I have done so in some cases by little valves but they are very apt to get out of order. I tried them as an experiment only.

3072. It must be a valve of considerable size?—No doubt larger valves would answer better.

3073. Supposing you had a flat disc 12 inches in diameter that would drop a quarter of an inch, and that was connected with a six-inch pipe, the moment the water rose, that disc being so much larger than the pipe, the pressure underneath would close it?—Yes.

3074. Being so much larger than the pipe, when you drew the water away the pressure of the air on the top would open it; that is to say, by making the disc larger than the pipe you would make it self-acting?—Yes, I quite see what you mean.

3075. Would it be possible to make such balance valves and place them where you would be absolutely certain that you would fill your mains and not force impurities into the pipe?—It would be quite possible if we had one of those valves on every one of our 5,000 services; but it would, I am afraid, be rather a troublesome addition to our apparatus.

3076. How many sections have you divided your works into? I do not imagine that such a valve would be required upon every service, but upon every section of services?—It is only in the service pipes that this gas accumulates.

3077. Not in any of the branch mains?—No. If the thing was to be carried out completely, it would require one of those valves in each of the 5,000 services that we have, and it would be only to meet the few cases of complaint that we have had made.

3078. (*Mr. Harrison.*) There have been 182 complaints of short supply from defects in ballcock, lead pipe, or other apparatus belonging to the tenants, but those would be complaints for which I suppose you are not liable?—Not at all, a great number of the complaints will be found to be of that kind when they are investigated.

3079. Complaints arising from neglect on the part of the tenants themselves or the owners of the property?—Yes.

3080. (*Chairman.*) Your supply being intermittent, I presume you supply the service tanks and service tubs which are placed in the back yards and front areas, and in fact almost every conceivable place contiguous to the houses?—We do. There is a great deal of waste in the New River district, as in others, and our attention is constantly directed to that; it requires quite a staff of men to visit continually in order to keep that tendency down in places within control.

3081. Do you know that servants almost as a rule either prop up the ballcock or take it bodily off, so that there may be no stoppage to the incoming of the water when it is on?—Yes.

3082. And supply, in that case, means a supply of waste?—Yes, we know that half the quantity would probably suffice for use.

3082a. That is, for all reasonable use?—Yes.

3083. (*Mr. Harrison.*) You mentioned the other day what you considered to be a fair sized cistern for the ordinary tenements of the poorer classes?—Yes, I said that I had gauged a certain class of houses called model lodging houses, specially to be used for the habitations of the poor, and in those houses the consumption did not reach seven gallons per head per day, allowing them to take all they required.

3084. (*Chairman.*) Had they a constant service?—It was not a constant service, but the enlarged cisterns were filled daily; they were never empty, so that it was constant to them.

3085. If you had to supply a block of property with 1,000 persons in one court or range of courts, it would not, I suppose, require a very large cistern to supply 1,000 inhabitants?—No, it would not.

3086. Do you think that if London were divided into sections, and were so supplied with water, you could reduce the volume of water that is now wasted to a very large extent?—Very much indeed, and the supply would be constant to the whole. The only objection that I ever heard against the plan is that of having cisterns at all. Some persons exclaim against cisterns as being something wrong, but if they are made of cast iron or slate and are covered and properly placed, so as not to be fouled either by dust or infiltration, I think no mode of supply is better.

3087. (*Mr. Harrison.*) If cisterns were made such as the Chairman suggested, those large cisterns might be placed under the control of the water company, might they not, and with advantage?—We are allowed now so far to control the cisterns and the fittings as to require imperfect ones to be made good, but we find that the amount of power we have is not sufficient to make sure that the cisterns are sufficiently well covered and that proper apparatus is provided by the landlords.

3088. If cisterns were provided to supply 1,000 houses, could not the water company then overlook them and see that they were properly attended to?—To have one large cistern to overlook for the supply of a large number of houses would of course be easier than having one little cistern in every house.

3089. If such a plan was adopted, do you think that the water company could keep the cisterns in an unobjectionable state?—Yes, by cleansing them; at the present time we do not undertake to cleanse them, and it would be an additional duty laid upon the company if we had to cleanse any cisterns.

3090. (*Chairman.*) If the water is clean when passed into the mains, and it is not allowed to see daylight till it comes into a properly arranged cistern, is there any probability that it will get foul?—I think not, if the cistern is only properly placed.

3091. And protected from external impurities?—Yes; I believe that the thing it would suffer most from would be vitiated air coming into contact with the water, and the water absorbing it.

3092. If the cistern were covered and ventilated, do you not think that you could dictate what kind of air should go in, as every particle might be made to pass through a charcoal filter?—We could do that.

3093. (*Professor Way.*) So that when the air went in and out, when the cistern was filled, it would be pure air that went in?—It might be drawn through a charcoal sieve.

3094. (*Chairman.*) Do you know that pure water, that is to say, water which so far as we know has no impurity in it, if placed in a covered reservoir absolutely requires ventilation to keep it sweet?—Yes; I believe that the purer the water the more rapidly it gets contaminated.

3095. (*Mr. Harrison.*) You mentioned seven gallons per head as the quantity taken in the case of the model lodging houses, but 30 gallons per head is the actual quantity consumed over the whole district?—Yes.

LONDON.

Mr. J. Muir.

15 Dec. 1866.

3096. You stated that you had very much diminished the leakage throughout your district; if so, what becomes of that large difference?—It is wasted through having defective ballcocks.

3097. (*Chairman.*) Or defective services which have no ballcocks, where they have been deliberately taken off?—Yes.

3098. Is there anything further which you wish to bring before the notice of the Commissioners?—I was asked at the last examination touching the limits or limit of the company's supply. I mentioned then 35,000,000 of gallons per day as the limit, but I wish it to be understood that that is the limit with the existing works, because it is already in evidence that the New River Company have a right to a moiety of all the water of the Lee. At present, we use only between 18,000,000 and 19,000,000 of gallons per day on the average; the average quantity for the past portion of the present year has been very little over 18,000,000 of gallons.

3099. What would be your limit if you went to the utmost extreme, knowing all the sources that you have to draw from?—All the flood water of the Lee, not yet touched, could be made available for the two companies after the purification of the valleys which you have now in hand. The exact addition that it would make to our resources I cannot say. It would require more careful gaugings than I have made to ascertain that.

3100. That flood water would be economised, and held in storage reservoirs?—Yes. The New River Company, moreover, have an old right which has not been exercised for many years, but it is in their power to deliver water into the streets of London, for sewer purposes and sewer flushing, for surface cleansing and similar uses (for which filtered water is now wasted) by pumping from the Thames between Blackfriars Bridge and Southwark Bridge. We have now a suction in the Thames, which has not been used for many years, and by carrying out separate lines of mains a very sufficient supply of water for the above purposes may be obtained in the New River district from the Thames.

3101. For surface washing and surface watering?—Yes, and it would practically add a good deal to the company's resources.

3102. Looking to the supply of water as it exists in London and the population of London as it at present exists, what are your views, as an engineer having charge of one of the greatest sources of supply, with respect to an entirely new supply for so great a population as that of London?—I cannot think that an entirely new supply is yet needed. If you look into the very far future, there is no saying what may be required, but if the Thames is to be thoroughly purified, and the valleys of the Lee are to be purified, and the water can be properly economised and distributed, it will provide a fair and abundant supply to the inhabitants of London for many years to come.

3103. If you replaced a moiety of all the water that is supplied to London, that quantity, utilized as it might be, would supply the wants of a population of 6,000,000?—Without bringing in an additional drop of water, that saving would provide London with water for 50 years to come.

3104. Is there anything further you wish to add?—I should wish to state what payments the New River Company have already made for the improvement of the River Lee. Some of the payments were for navigation purposes, other outlays have been for the purification of the Lee. I have here the amounts more accurately set down, and I believe that the sums which the company have paid for the improvement of the navigation may be put down at upwards of 53,000*l.*

3105. Within what period of time?—The payments before 1855 appear to have been but few and small, but in 1855 the sum expended was 42,000*l.* for navigation purposes. The New River Company have lately re-erected one of the locks on the navigation at Hertford, and altogether their outlay for navigation purposes has been 53,000*l.* up to the present date It has been 47,400*l.* since 1855, and there were other small amounts before 1855.

3106. (*Professor Way.*) It has not been for the improvement of the water supply, has it?—Indirectly it has. It has been like sums of money to be laid out on the River Thames in improving the navigation of the whole course of the River Thames, and water companies are supposed to benefit by those improvements.

3107. (*Mr. Harrison.*) It has been stated that the water which the New River Company abstracted from the river at Hertford lowered the water to such a degree that the boats could not pass over the sill into the lock?—Yes.

3108. And therefore the company went to the expense of constructing a new lock, so as to improve the navigation and enable you to continue to take the same quantity of water?—Exactly so.

3109. (*Professor Way.*) That did not improve the water, but it enabled you to take more?—It did not affect the quality of the water, but I may say that other outlays which the company have made have had to do with the quality of the water, and they have spent more than 30,000*l.* on sewage works connected with the River Lee.

3110. Do you mean at Luton?—No, at Hertford. The town was sewered and works were erected, the working cost of which exceeds 600*l.* per annum, so that if you take the interest upon the first cost of the sewerage works, rather more than 1,500*l.*, and add to that the annual outlay for carrying on the works, the total is 2,132*l.* annually paid for sewerage works, without at all saying whether the money has been judiciously spent or not. The New River Company pay to the River Lee trustees annually 1,500*l.*

3111. (*Chairman.*) Looking at what you have had to do to make your own supply available, and at what you have to pay annually for the purification of the sewage, do you think that the West End companies are hardly dealt by in having to pay 1,000*l.* a year to the Thames Commissioners for what they are to do for them?—I think that we already pay more in proportion.

3112. (*Professor Way.*) Are you under any engagement with the town of Hertford for the purification of the sewage for any number of years?—No; I suppose it is to be perpetual.

3113. Supposing that you desired to apply the sewage of Hertford to the land instead of precipitating it, would it be feasible to do so?—I believe it would be quite feasible.

3114. Who do you think would have to move in it?—The Act of Parliament does not contemplate such a way of disposing of the sewage. It states that it is to be deodorized, and if a certain process—say the process of distributing it over the land—is proved to be the best plan, I think it would come within the terms of the Act to apply it to the and.

3115. Have you any other evidence to lay before the Commission?—Nothing else occurs to me at present except to give you this account (*handing in the same*), and the titles of the Acts of Parliament to which I have referred.

1. Chapter 160. An Act to enable the Governor and Company of the New River to improve their supply of water, and for other purposes, dated 30th June 1852.

2. Chapter 39. An Act to enable the New River Company to construct certain sewers, drains, and other works in and near the town of Hertford, and for other purposes, dated 2nd June 1854.

3. Chapter 42. An Act to enable the New River Company to raise a further sum of money, to construct other sewers at Hertford, and to amend the Acts relating to the company, dated 13th July 1857.

The witness withdrew.

The witness subsequently forwarded to the Commissioners the following paper:—

STATEMENT OF THE CHANGES AND EXTENSIONS WHICH THE NEW RIVER COMPANY'S WORKS, &c., HAVE HAD SINCE REPORT THEREON BY SUPERINTENDING INSPECTORS OF THE GENERAL BOARD OF HEALTH IN THE YEAR 1856.

Acts of Parliament.

Since 1856, the New River Company have had authority (by their Act of 1857) to create a debenture stock in lieu of bond debt, to construct additional sewers at Hertford for the maintenance of the purity of the River Lee, and to raise a further sum of 300,000*l.* for the execution of these works, and for the general purposes of their undertaking.

The company are now seeking authority from Parliament to obtain the additional amount of 500,000*l.* for the increase, improvement, and extension of their supplies.

Sources of Supply.

The New River Company have, for their sources of supply (as in 1856)—

The Chadwell Spring,
The River Lee,
Amwell Well,
Amwell Hill Well,
Cheshunt Well,
Hampstead Road Well, and
Tributaries to the New River.

Also the following sources of which the company have possessed themselves since 1856:—

The springs at Hampstead and Ken Wood, the waters of which are collected in 13 ponds on Hampstead Heath and at Highgate, having a joint area of about 30 acres.

These waters are distributed by *separate* mains for *street*, *sewer*, and other *non-domestic* uses.

An artesian well on Hampstead Heath, formerly (with the springs and ponds above named) the property of the Waterworks Company, the supply of whose district was undertaken by the New River Company in the year 1857.

A new artesian well, recently made by the side of the New River at Hoddesdon, in Hertfordshire.

The last-mentioned well has, as yet, done no work; and there has been no occasion for any use of the Amwell, Hampstead Road, and Hampstead Heath wells, for several years. They have been kept in reserve.

From all the above-mentioned sources (reckoning contribution from the Lee at only 2,500 cubic feet per minute) there may be obtained a daily supply of more than 35,000,000 gallons.

Although no supply has been taken from the Thames into the New River District, for any purpose, for many years, additional quantities of water may be drawn by the New River Company from that river, below *Blackfriars Bridge*, and delivered through *separate* mains to any extent that may be hereafter required, for *street cleansing*, *sewer flushing*, *extinction of fire*, and other such uses.

In order to add to the provisions which they have already made, for the future, the company have purchased nearly 90 acres of land for the construction of a store reservoir near Broxbourne, are increasing their means of supply from Amwell well; and are making arrangements for the sinking of a new well on the line of their river between Hoddesdon and Cheshunt.

The company's draught from the River Lee is not limited to the 2,500 cubic feet referred to above, and named in the report of Inspectors to the Board of Health in 1856. The said quantity (equal to 22,435,000 gallons per day) represents only the rate of draught to which the New River Company have a prior right. For by pumping to supply the demands of the Lee navigation, and by provision of steam power for mill owners, the New River Company, in conjunction with the East London Waterworks Company, may take the water which those two objects would otherwise absorb, and may, by storage, also make use of the flood waters of the Lee to any extent that may be necessary.

Since 1856, the New River Company have constructed sewers throughout the town of Hertford, and have erected works at which the sewage of that town is dealt with, and disposed of, as the New River Company's (Hertford Sewage Diversion) Act of 1854 directs.

The shortenings and improvements of the channel of the New River (effected before 1856 as far down at Cheshunt) have been subsequently continued, and completed between Cheshunt and London. And so much of the river channel, as is within the more urban parts of the metropolis, has been covered over for the better protection of that part of the company's supply which is delivered for filtration at the New River Head.

Reservoirs.

The small circular basin which was situated in the Hampstead Road, and reported in 1856 as then used only for the supply of contiguous baths and wash-houses, has been removed, the establishment which it served having been closed. This excepted, the company now have, in addition to the reservoirs named in the report of 1856, and in addition to the above-mentioned 13 ponds at Hampstead and Highgate, a new subsiding reservoir at Hornsey, with an area of 8 acres, and a capacity of about 20,000,000 gallons; also covered, filtered-water, service reservoirs on Highgate Hill and Hampstead Heath, having a joint area of 22,000 square feet, and a joint capacity of about 1,500,000 gallons.

The company's store and subsiding reservoirs now have a total area of about 100 acres, and a total capacity of about 200,000,000 gallons. Their covered, filtered-water, service reservoirs, have a total area of about 164,000 square feet, and a total capacity of about 20,000,000 gallons.

Filtration.

The means of filtration which the company had in 1856, have been increased by the provision, at Hornsey, of three new filtering beds, having a joint area of two acres. Contracts have been entered into for the construction, at the Company's Stoke Newington Station, of two other beds of the united area of two acres.

When these two beds are finished, the company's whole filtering area will be equal to 11½ acres.

The result of the company's filtration is seen in the analyses, which they regularly obtain, of the water of the New River, as the same is delivered to consumers in their district:—

The average amount of organic matter which *twenty-four* of these analyses (made by Dr. Letheby during the past year) assigned to one gallon of water in decimal parts of a grain, was	0·454
Some of the examples examined had but	0·2 or ⅕th
of a grain of organic matter in a gallon, that is one part in 350,000 parts.	
Eleven analyses obtained and published for the same period by the Registrar General, gave an average of	0·671
parts of a grain per gallon, as the amount which New River water contained of organic ingredient, hygrometric moisture, and whatever else was driven off by incineration.	
Analyses published under the same authority, have shown the organic impurity of—	
Loch Katrine water in parts of a grain per gallon to be	0·605
And of *Manchester* water, according to the same scale, to be	0·680

Pumping Arrangements.

Since 1856 the New River Company have erected an engine of 75 horse-power (with three boilers) at Hornsey, and an additional engine of 30 horse-power, with extra boiler, at Highgate, to aid in the "second lift," by which water is raised to the top of Highgate Hill and Hampstead.

They have also placed a 50 horse-power engine and boiler at their new well at Hoddesdon.

Their whole engine power is now that of 1,680 horses.

Tenements supplied.

The New River Company now supply water to 111,958 houses.

Rates of Charge.

These are regulated by the New River Company's Act of 1852 (sections 35 to 41 inclusive).

This Act makes a supply of water for domestic use, in the New River District, to be generally liable to a charge of 4 per cent. per annum on the annual value of the houses served with certain extra rates for baths, high service, and waterclosets, in houses having a higher annual value than 30*l.*

In many cases charges remain considerably below the limits at which they might, by the said Act, be fixed.

All supply of water for extinction of fire is *without charge*.

LONDON.

Mr. J. Muir.

15 Dec. 1866.

Mode of Supply.

The New River Company's supply continues to be, in most cases, an "intermittent one," delivered into the tanks, or butts, which consumers provide. And wherever there is sufficient cisternage, properly placed, protected, and cared for, consumers have no inconvenience from the arrangement. They then, on the contrary, have, what is practically, a *more constant* kind of service than that which would be furnished by the mere connexion with a "main" which is often described as "constant supply." With this so-called "constant supply," without cisterns houses must be entirely without water on every occasion on which mains have to be closed for their unavoidable extension or repair.

Supplies, intermittently furnished by the New River Company, are "turned on" daily, for, at least, six days a week; and are "left on," on each occasion of delivery, for as long a time as may be necessary (with adequate house pipes) for the filling of any reasonable amount of cisternage which consumers may provide. In some cases of intermittent service, in which the supply of the poor is concerned, and in which parish authorities remain unable, after their best exertions, to compel the landlords of small houses to provide properly for their tenants' reception of water, a seventh or Sunday supply, is given. About 4,000* houses in the New River District now have such extra service. Sunday supply is, of course, also afforded to all houses "on the main." The company have more water to pump on other days of the week because of non-delivery of it on Sundays. They also pay their foremen, turncocks, and engine-workers for Sundays, as if they all then worked; but their rule is not to deprive these men of their Sunday's rest without good cause. And in few cases can it be truly said that the turncock's services on Sunday are necessary. Often where the want of them is complained of as an evil, the loss of water by leakage, through the consumer's faulty cistern fittings, is the sole cause of the inconvenience felt.

Wherever consumers are ready to take water in any way that will give a sufficient guarantee against *waste*, the company are ready to make supply "constant" in the sense of allowing an uninterrupted communication with their mains. They do so now in more than 1,200 cases. The general adoption of the "constant system" would be for the company's advantage, if only it could be effected without waste. The company, therefore, have no interest in the discouragement of *that* system under any conditions which would effectually prevent waste. *Without the strictest precautions against waste*, the "constant system" would greatly increase the company's filtering, pumping, and other expenses, and would through these expenses alone, operate not a little—although indirectly—to the disadvantage of the public. A wasteful, constant supply, would bring this further injury to consumers, that in consequence of the excessive discharge which it would allow in the lower levels of a district, it would leave houses, in the higher ground of the same district, far short of their fair share of supply.

Thus special provisions against waste are the indispensable accompaniments of any attempt to afford constant supply. Such provisions, however, involve both a *cost* in the alteration of house pipes, &c., and *restrictions* to which consumers in London are not ready to submit. Hence it is that there is yet but a *partial* adoption of "constant" service in the New River District, although the New River Company have been perfectly prepared for years to furnish it, on the fulfilment, by tenants, of the conditions which the 15th section of the Metropolis Water Act of 1852 prescribes.

In no case has there been requisition to the company, under this section, to provide the constant supply to which it refers.

"*Constant supply*" is sometimes spoken of as if it were the only *high pressure* one. But the "*intermittent*" supplies which the New River Company give *are of high pressure.*

Although so many houses in the company's district continue to be "*intermittently*" served, all the company's leading pipes, or "mains" (having an aggregate length of more than 200 miles) are "*constantly*" charged, so that by the mere drawing of a plug on any of these mains, there may be instant supply for the extinction of fire; and by the opening of a single cock, there may be immediately charged, for like service, any one of those short, subsidiary, lines of pipe which are branched from these leading mains, and which lie in every street in the company's district. Here are better means of concentrating pressure for water supply at fires than there would be with all pipes charged (as under the "constant" system) and open at all times to the draught which the service of consumers, or their waste, might cause.

Under existing arrangements it is very seldom that water from the company's pipes is not flowing *before* the engines of the fire brigade are ready at a fire to use it. If fire engines have had, at any time, to wait for water, it has been through delay in the call of a turncock to the spot. To induce the early call of their turncocks, and to insure the quickest attention thereto, the company reward all persons who first give notice of fires; they allow their own men gratuities for promptness, they set up marks to indicate the places at which their turncocks and deputy turncocks reside, and they forward, every quarter, to all *police, fire, parish*, and other public stations, printed lists of the names and addresses of their street foremen, turncocks, and deputy turncocks, with advertisement of the reward which they pay (as aforesaid) for "first calls." To meet the rare occurrence of a turncock's late call, the company have repeatedly intimated their readiness to allow both firemen and police the use of the keys, by which these officers might, at any time, in the absence of turncocks, obtain themselves the water wanted at a fire. The firemen have, in fact, such keys, but decline the responsibility of using them. By the attachment of improved hydrants to mains, these might be some additional facility for the ready acquirement of water for extinguishing fire, but such new appliances would throw on parishes considerable additional outlay.

What Parish Authorities have done to require a Supply of Water to the Houses of the Poor, under the 27th section of the Metropolis Water Act of 1852.

Parish officers have exerted themselves, on many occasions, within the New River District, to require the owners of small houses to procure a proper water supply for their tenants; and in so doing, they have had all the aid which the company are able, in such circumstances, to render.

No formal requisition, in regard to a reduction of charge, has, in such cases, been made to the company by churchwardens, or other parish authority, under the 27th section of the Metropolis Water Act of 1852; but the company have always willingly laid down pipes, when these have been needed, to bring water within the reach of the poor; and they have been careful to apply only *reduced* rates of charge for the water supplied to any house property of the humbler sort.

Quality and Quantity of Water supplied.

In regard to the *quality* of the water served by the New River Company, it will here suffice to refer to analyses already published, and to the previous statements under the head of "filtration."

As to *quantity*, the company are always ready to serve as much water as the consumption of their district requires. The average daily demand of 111,447 houses during the past year was 23,460,548 gallons.

The company have no knowledge of any complaint by memorial to the Board of Trade, under the 9th section of the Metropolis Water Act, with regard either to the *quality*, or the *quantity* of their supply; and they have not had either inquiry or notice on such subject from any inspector appointed by the said Board, under the 10th and 12th sections of the above-named Act.

There are, no doubt, within the company's district, many cases of very imperfect supply, especially to houses in the occupation of very poor people; but for the defects of these cases the company are in no way responsible. The company have laid down the pipes which could furnish a good supply; they have, in certain cases, offered, for moderate interest on their outlay, to provide the apparatus by which landlords ought themselves to secure for their poor tenants a proper water service, and they are ready, with any provision which landlords may make for the reception of supply, without waste, to let the service of the houses in question be a "constant" one. Whatever defects remain are due to the indifference of landlords, and their inadequate arrangement for the water supply of their tenants.

Cost of the Company's Works.

The report of the Inspectors of the Board of Health in 1856, represented the New River Company's whole outlay on works, up to the end of the preceding year, as 1,987,801*l.*

The company, at the close of the past year, had laid out on new works and extensions, inclusive of purchase of lands, &c., the further sum of 508,756*l.* 17*s.* 7*d.*, making, with their previous outlay, a total expenditure of 2,496,557*l.* 17*s.* 7*d.*

(Signed) JAMES MUIR.

* This number has been raised, since the date of the above return, to nearly 50,000.

Mr. JAMES KNIGHT examined.

3116. (*Chairman.*) What are you?—I am surveyor to the vestry of Mile End Old Town.

3117. Was the report which is lying on the table made by you to that vestry?—It was.

3118. Do you wish to put it in?—If you please (*handing in the same*).

3119. Does that report contain an account of a personal inspection made by you of the New River?—Yes, and of the river Lee, and the river Stort.

3120. I see that you have given the details here with regard to these rivers, and you end with a summary. You say in this summary that "the water "of the East London Waterworks Company is pol- "luted to a very large degree by the drainage of the "towns and villages situate on the banks of the river "Lee, from whence they derive their supply." You speak, I suppose, from personal inspection?—I do.

3121. Then you say that "an abundant quantity "of water, of even flow, and of the character at "present supplied, is not to be obtained in the sum- "mer without storing it for several months in open "ponds." Where are those open ponds situate?—They are reservoirs which have been recently constructed at Tottenham.

3122. What volume of water do they contain?—I do not know the actual quantity; but the average is something like 80 acres. 110 acres of land altogether would include the whole.

3123. Then you say lastly, that "pure water in "sufficient quantity for the present and probable "future wants of the district cannot be obtained in "my judgment from the present source of supply at "all"?—I do.

3124. Do you know what is the volume of water that they profess to give daily to the metropolitan population that they supply?—About 24,000,000 of gallons.

3125. What would that be per head of the population that they deal with?—Nearly 30 gallons per head.

3126. From your experience, do you believe that 30 gallons per head are recognized or used?—The 30 gallons include the whole of the water supply for every purpose. It is not alone for the consumption of human beings.

3127. Do you know what proportion of that quantity would be consumed for trade purposes?—No, but I know that it is large.

3128. Do not you know what proportion is used for domestic purposes?—I cannot say.

3129. Have you ever made any experiment as to what any number of persons or any family would use if they did not waste any?—I have.

3130. What volume should you say would be used?—For all purposes, taking the period of a month, about 11 gallons a day per head.

3131. If the same persons or families were simply to use water and not waste it, you think that 11 gallons a head would be enough?—Yes, I do.

3132. Can you detail to us how you tested that?—By management, in a cistern in one of my own houses.

3133. Did you adopt some mode of registration?—Yes, from morning to morning—it is an intermittent supply—I gauged the quantity which had been delivered into the cistern.

3134. In your own house?—Yes, in a house that I own.

3135. Do you consider that you made your experiment with sufficient care, so that it may be taken as a reliable experiment?—I do.

3136. Do you consider that the supply is ample for all their requirements?—Yes, they always have water.

3137. Were there any parties in the house to which you have alluded who were accustomed to take a morning bath?—No, it was comparatively a poor house.

3138. For bath purposes the volume must be added to?—Yes.

3139. Mile End Road does not, I believe, come into the New River district?—No; it is in the East London district. The whole of Mile End is, and Whitechapel, St. George's-in-the-East, Limehouse, Poplar, Bethnal Green, Hackney, and part of Shoreditch. I speak of the water supplied to the East London district.

3140. At what date did you make your investigation?—September 18th, 1866, and other days.

3141. How many days did it occupy you?—Five.

3142. Were you at all acquainted with the river and the sources of water supply before making that investigation?—I knew something of it. I had been over the ground previously.

3143. You did not then know it so intimately as you do now?—No.

3144. In making your inspection did you find the sources of pollution more injurious or less than you had anticipated?—Infinitely greater.

3145. You found that the pollutions were larger than you had anticipated?—Very much so.

3146. Did any person accompany you when you made the inspection?—No official.

3147. Did you communicate at all with the authorities of the river Lee or the New River Company previously to making the inspection?—I did not.

3148. Did your board send a copy of your report to the East London Waterworks Company?—Yes.

3149. Did the board receive any reply after their reception of it?—I am not aware that they did.

3150. Are you aware whether any part of your statement made in this report has been disputed?—I am not aware that any part of it has. I attended a deputation of the vestries and district boards of Whitechapel, St. George's-in-the-East, Limehouse, Poplar, Hackney, Shoreditch, Bethnal Green, and Mile End—altogether eight—which waited upon the East London Water Company.

3151. What took place at that interview?—We met the board of directors, and requested to know whether they proposed to make any alteration in the quality of their water, and we were informed that they intended to go to Parliament this session for power to take water from the river Thames, in addition to that which they have from the Lee. They also told us that they intended to ask for power to compel the various towns in the Lee valley to prevent their sewage from contaminating the water; but they did not propose to go to any expense in the latter case themselves.

3152. Do you know whether they have taken steps to fulfil their promise to you?—Yes, they have, so far as the advertisement of their intention goes.

3153. Previously to your making this investigation as to the water supply, had you made any personal examination into the seats of cholera in the several areas that you have enumerated?—Only within our own district.

3154. Which is that?—Mile End.

3155. At which points did you make your investigation?—I will point them out on the map (*describing*).

3156. Whereabout did the cholera rage the worst during the last spring and summer?—In our own district it was nearly equally distributed over the whole area.

3157. Where had it first commenced?—It first commenced at the eastern end of the district, at the south-eastern corner—Stepney.

3158. What road is that (*pointing to the map*)?—The Mile End Road.

3159. Did it commence at the corner formed by the crossing of the Mile End Road and the Regent's Canal?—No, it was at our eastern boundary, near to Bow, that is where it commenced.

3160. At about what date did it first break out?—I think it was on the 13th July; it began at West Ham, and passed the next day into Bow; the following day it visited us at Mile End.

LONDON.

Mr. J. Knight.

15 Dec. 1866.

3161. Did you about that time have any complaints made to you as to the quality of the water supplied to the inhabitants?—None.

3162. From your own knowledge have you reason to believe that the East London Water Company had been supplying a different kind of water from that which had been ordinarily pumped into the district?—I have strong reason to suspect it now from what I have seen.

3163. From what source do you think that water was obtained which you believe was different from the water usually supplied?—From Bow Creek, or that part of it which is now navigation, immediately below King's lock.

3164. Have you any reason to know why that water should have been drawn upon at that time?—There was a broken main which passed under the old river, and which had been known to the company to have been damaged, as I am told, for 18 months.

3165. Did that broken main interfere with their getting the filtered water which they usually supplied?—The filtered water passed through that main and the main passing under the old river, and being cracked, the water from the river, which at high tide is driven up over a little penstock, was really mixing with the water of Bow Creek.

3166. Then you have reason to believe that the main supply pipe laid down under the old river, from some accident, or wear and tear, or something else, had cracked, and to that degree that it was capable of admitting the foul water from the old river above it?—From the investigation that I made I was led to believe that it was the main pipe leading from Lee Bridge works to Old Ford works.

3167. If that main pipe drew water from that source, would that water be contaminated by the sewage of West Ham and the sewage of other districts flowing into the creek above and below that point?—Not by the sewage of West Ham, but the whole of the other districts.

3168. Why not by the sewage of West Ham?—Because that is turned into Bow Creek, a long way down, just at the tide's end.

3169. Then it would be by sewage from portions of the district situate above?—Yes. There are a number of factories on the banks of the river, and the water is always in the most foul and filthy state.

3170. Why do you think that contaminated water might have been pumped in from that source?—From the fact of the pipe being laid under contaminated water and having a fracture in it.

3171. Do you know at what time the fracture occurred?—I do not know, but I have been told that it was about 18 months since.

3172. And no steps had been taken to repair it?—They attempted once to do it, but not successfully.

3173. How did you obtain your information upon this subject?—There is a lockkeeper who lives on the spot, who communicated it to me through a friend.

3174. Is the lockkeeper a servant of the river Lee trustees?—He is; and he is quite prepared to give you this information; he was an eye witness to the whole; it was below the lock, and about half a mile above the crossing of the North London railway.

3175. Did the East London Water Company about that time take any steps to rectify that state of things?—They did.

3176. What were the means they resorted to?—By putting a jacket of lead round the pipe.

3177. Is that jacket of lead on the pipe now?—I believe it is.

3178. It is serving its purpose now?—I believe it is.

3179. (*Mr. Harrison.*) At what depth is it below the bed of the river?—A very short distance indeed, scarcely 18 inches; I mean the top of the pipe below the bed of the river. It was exposed when I was there.

3180. (*Chairman.*) Have you inspected the filter beds at the pumping station above, and the pure water basin, and the conduit below?—I have not recently done so, but I know them well.

3181. (*Mr. Harrison.*) Do you know what the level of the water in the reservoir is at Lee Bridge; is there a considerable lift to the level of the water in the covered reservoir at Old Ford?—I do not know.

3182. Be good enough to point out on this map where Blackwall is?—It is there (*pointing out the same*).

3183. Is that part of your district?—No, it is in the Poplar district.

3184. Is any part of your district below the high-water line?—No.

3185. Do you know whether a part of Poplar is or not below the high-water line?—A portion of it is below the high-water line.

3186. Do you know whether any part of that area was submerged by sewage in the spring and early part of this summer, in consequence of the flap valve getting out of order?—I do not know that; I have not heard it spoken of.

3187. Is the main sewer of the Metropolitan Board carried through your district?—No; it passes through Limehouse just below our district; Limehouse is next to the river, and the main sewer passes down below the Commercial Road.

3188. Are the old sewers from your district passed into the new sewer which has been constructed?—I do not think they are connected yet, but the work has progressed just up to the point for connexion; I do not think it is yet made.

3189. (*Chairman.*) Are there any private wells or pumps in your district?—Yes, several.

3190. Are there any, or many, privies with cesspools?—There are 800 in our district at the present time.

3191. Have you reason to believe that any of the cesspool matter can, by possibility, contaminate any of the wells from which water is drawn?—Yes, I have good reason to believe it, because this case occurred in Jubilee Street; there were six persons who died, I believe, of cholera there on its first outbreak, and we found upon inquiry that many of them had been taking and using the water from a yard belonging to a greengrocer who had died, and that water was from a surface well surrounded by cesspools.

3192. Can you give any other instance?—No other case which was so clear as that was.

3193. What is the subsoil in your district, is it gravel?—Yes, gravel on clay.

3194. Is it porous gravel?—Yes.

3195. What is the character of your sewers and drains, are they made of brick or pipes or both combined?—Lately all our main sewers have been made of brick, the smaller sewers are made with pipes.

3196. Are those pipe sewers so tight as to induce you to believe that the sewage cannot get out of them into the subsoil?—I cannot undertake to say that that is so.

3197. If there were any pumps near to any of your sewers or drains, might not the water be contaminated by them?—I think very likely it would be so.

3198. During the last spring or summer, after the cholera had broken out, was the necessity for taking means to close those pumps ever discussed?—Not until the cholera had broken out,

3199. Were any steps then taken to close them?—They made them incapable of use by taking away the handles and the buckets.

3200. Where they private pumps?—Yes.

3201. Were any remonstrances made by the owners?—Yes, but we disregarded them, and what we did was done at our own risk.

3202. Has the use of the pumps been restored?—Not at present.

3203. Are there any private wells at present in use?—Not to my knowledge.

3204. Have you taken any means to diminish the number of the cesspits or cesspools by serving notices

on the parties?—We are doing that very rapidly indeed.

3205. By whom are they cleansed at present?—By the owners of the property—the cesspits.

3206. Do they do it voluntarily, or have you to repeat the notices?—They have lately done it when they get foul.

3207. Are any of them so situated that the refuse has to be brought through the body of the house?—Yes, in almost every instance.

3208. During the time that that operation is going on, in what condition will the atmosphere be?—Very objectionable, indeed, very foul.

3209. Have you ever known sickness to be caused by the emptying of these foul places?—I have not.

3210. Have you ever heard of it?—I cannot say that I have. As soon as we discovered that there were so many cesspools still in existence, I received directions from the vestry to deodorize them all by using carbolic acid, which I did, and I have kept them flooded up to a recent day.

3211. What amount of disinfectants in point of value have you used this summer?—I think about 350*l.* worth.

3212. The vestry have voted that amount, and the disinfectants have been used at their expense?—Yes.

3213. Did you use the powder as well as the fluid?—We used the powder of the lime, and the fluid acid.

3214. Did you supply carbonate of lime to the poorer inhabitants for their own uses?—Very largely.

3215. Did you compulsorily limewash any of the filthy houses?—Yes, a large number.

3216. Did any beneficial results follow?—I cannot say.

3217. Did you examine the private waterbutts and cisterns to see whether they were clean or foul in any cases?—Yes.

3218. In what state did you find them?—Generally in a very filthy state caused by the individuals themselves neglecting their own sources of supply.

3219. Did you in any cases cause those receptacles to be cleansed?—In many cases we ran the water out, and had them scrubbed out.

3220. How do you suppose they had become foul?—Principally I think from children playing near them, and throwing filth in.

3221. What was the general character of the water supplied at the taps?—It had all the appearance of being pure.

3222. Was it usually bright or turbid?—It had a bright appearance.

3223. If it was bright and passed into a clean receptacle, I suppose it would be comparatively clean?—I think so, but from what I have seen of the contamination of the water, I should not be led to suppose that it was very good.

3224. From what you have seen since you have made this inspection?—Yes.

3225. Has that altered your opinion?—Yes, it has; I think it cannot be good water, being polluted to the extent that it is.

3226. Did you form any opinion as to whether it would be practicable to prevent that impurity?—I think there would be no difficulty at all if proper measures were carried out.

3227. Did you so report to your board?—No, I did not so report it to my board. I reported the facts without prescribing a remedy.

3228. Can you state what number of wells there are in the district?—I cannot tell. I do not remember that.

3229. You can perhaps obtain that information?—Yes. There are not so many now as there were some years ago.

3230. Has your vestry power to compel the owners of property by notice to put on a public supply of water?—Yes, under certain circumstances.

3231. Do they ever enforce it?—Yes, they do in some instances, but it has not been necessary in more than three or four.

3232. (*Mr. Harrison.*) Was the case that you alluded to of a death from cholera one of the early cases?—Yes. I think the greengrocer was almost the first person who died in our district.

3233. He and his family, as I understood you, were supplied with water from a well surrounded by cesspits?—Yes.

3234. The well was upon his own premises?—Yes. He had a water supply from the East London Water Company, but he had this well in addition.

3235. Did you ascertain whether the water from the well was used for drinking purposes, or whether the company's water was used for that purpose?—They assured me that they only used the water from the well for rough purposes, washing and things of that kind; but I found that the people in the district were in the habit of sending there to get a pail of water, thinking it was better than that which was supplied by the company.

3236. Do you think that many persons in that neighbourhood were supplied with water from that well?—I have no doubt of it.

3237. Were there many people in the immediate neighbourhood who suffered from cholera?—As I have already stated, there were six deaths, which took place within a very short distance, within 150 yards, of that place.

3238. (*Chairman.*) Knowing these facts as you do now, should you regard the East London Water Company as accountable for those deaths?—I do not; not for those. I think that, with other circumstances, which are inexplicable to me, the same thing might have arisen from bad water supplied from the East London Water Company, as from the bad water from this well, if it were so.

3239. Putting things honestly and fairly together, at the first outbreak of cholera, and taking the number of deaths which occurred, you think that you cannot attribute them fairly to the bad water supplied by the East London Water Company?—I do say so. These cases were not the first, but nearly the first which occurred. We had a death or two in the extreme eastern part of the district within a few days.

3240. Did the cholera in its course sweep through whole rows of houses, or step over intermediate places, and strike down here and there?—I found that it had been almost uniform over the whole district.

3241. Not visiting all the houses in one street, but one or two houses in a street?—Yes, in every street, visiting the poor and the rich alike.

3242. And one or two members of a family falling victims?—Yes.

3243. The cholera was rather sporadic than epidemic?—Yes.

3244. If you were to dot the map over with a pen with black spots, the district to which you refer would be pretty equally spotted over?—Yes.

3245. Did you notice whether the cholera was the worst in the very poorest district, or in the district more inhabited by the middle classes?—I do not think there was much difference. Some portions of the population were very poor indeed; but I do not think it affected them more than it did persons who had all the comforts of life about them.

3246. Did it affect the poorer classes as much?—I think it was as nearly equal as possible.

3247. It did not fulfil the conditions you would have anticipated by striking down the very poorest?—No, for in places where I should have looked for it to be the worst it did not appear till after it had affected a number of well-to-do people.

3248. Did you suffer at all from bowel complaint?—No.

3249. Did you take special care of your own health?—I think not.

3250. Were bowel complaints very general at that time?—Yes.

3251. Did any of your men suffer?—Only two.

LONDON.

Mr. J. Knight.

15 Dec. 1866.

3252. What were they?—They were labourers on the road; old men.

3253. They might have been in a weak state of body?—They were, but they recovered.

3254. Were those men of sober habits, or otherwise?—They were tolerably temperate, I think, as ordinary working men. I should call them steady working men.

3255. Was your district as severely visited as Poplar?—No.

3256. (*Mr. Harrison.*) Stepney is close to your district, is it not?—There is no such place now as Stepney. Stepney now is divided into hamlets and parishes. Mile End is part of the old parish of Stepney.

3257. Is there not a registrar's district?—Yes, for Mile End.

3258. And another for Stepney?—There is another for the Limehouse division, Ratcliff, Wapping, and Shadwell. There may be one for the Stepney Union.

3259. (*Chairman.*) I believe the sewers and drains are not under your jurisdiction?—Yes, they are.

3260. It is the main sewerage that is under the Metropolitan Board?—Yes.

3261. Have you been carrying out much sewering and draining yourself in your parish?—Nearly the whole of our parish is now sewered. We have very little more to do.

3262. Are the sewers fully ventilated?—Yes.

3263. By open gratings at the surface?—Yes. I have tried charcoal, but I found that it did not effect the object.

3264. Do you cleanse the sewers by hand?—We do.

3265. What number of hands do you employ?—We have not sufficient employment for a regular staff at present. At the present time we have six men at work, but that will only last for, perhaps, a couple of weeks.

3266. Do you cleanse the sewers intermittently?—Yes; when it is necessary.

3267. Have you provided side entrances?—Yes.

3268. How many side entrances are there?—I think 23.

3269. What does it cost you, per cubic yard to get the refuse out of the sewer?—About 2*s.* 10*d.*

3270. How many cubic yards do you take out in a year?—The quantity is very little. The cleansing of the sewers altogether does not cost more than 80*l.* a year.

3271. What is the kind of material that is taken out?—Sand and gravel, which are washed in through the gullies.

3272. What is the shape of the main sewer?—They are all egg-shaped.

3273. Have you the means of flushing them by penstocks?—Yes, we have a few.

3274. Do you flush the sewers in that way?—Yes, we do.

3275. Do you think that your district will be benefited by the low level sewer that has been constructed?—Not in any way. We lie above it, and below the mid level sewer. Our district is drained now into the Thames.

3276. Will not that drainage be brought back into the low level sewer?—It will be so intercepted.

3277. Will not that be a benefit to you?—No, it will simply be passing the sewage into the low level sewer instead of into the Thames.

3278. Is it not tide locked now by being drained into the Thames?—Not in our district, we are above that.

3279. Into what district do you drain?—We drain through Limehouse in one portion, and from Ratcliff in another.

3280. Whereabouts on the Thames do your outlets discharge themselves?—There is one at Limehouse Hole, and the other is at Ratcliff.

3281. Are those outlets offensive at any time?—Very much so.

3282. Will they not be removed when the low level sewer is finished?—Yes.

3283. Your sewage will be taken in here (*pointing to the map*) and be pumped up at the Abbey Mills pumping station?—Yes.

3284. Are you troubled much with rats in your district?—Not in our sewers, I never saw such a thing.

3285. I suppose they cannot live in the egg-shaped sewers?—No.

3286. You know, I suppose, that in the flat bottomed metropolitan sewers there are plenty of rats?—Yes.

3287. Do you think that if yours had been made with flat bottoms you would have had the same trouble?—Yes. Ours are kept perfectly clean by their own action and the regular flushing that we give them.

3288. What is the least fall that you have in your mains?—The least fall that we have is 1 in 480.

3289. What is the greatest?—I think it is 1 in 240.

3290. Have you any difficulty in keeping them clean?—No.

3291. Have any complaints been made of a stench getting back into the houses that are connected with the drains?—We may have had one or two in the course of ten years, but I think not more.

3292. Do you ventilate by down spouts?—No.

3293. Are they connected with the tributary drains?—In nearly every instance.

3294. You could ventilate if they are connected without being prevented by trapping?—All our connexions are trapped.

3295. Do you bring the spouts down and connect them?—Yes, direct from the house to the sewer.

3296. Then the spout comes on to it?—Behind it, I may say.

3297. How many soil pans or waterclosets are there in your district?—The actual number is 12,000; there are 12,000 houses.

3298. What is the population?—80,000.

3299. Have you much trouble with them?—Very little. I know that in the poorer districts the landlords are annoyed by the tenants destroying the pans.

3300. In your opinion is it preferable to have waterclosets with the trouble connected with them, or to have cesspits with their abominations?—In my view there is no comparison, the watercloset is a remedy for the other, which is a horrible nuisance.

3301. Are you troubled with the waterclosets during a frost?—I never heard of anything of the sort; occasionally there has been such a thing in a very exposed place, but it is not general.

3302. Supposing the Manchester authorities told you that it was impossible to use waterclosets with a working population, what would you say to that?—My experience would lead me to the very contrary conclusion.

3303. And your experience has been upon a large scale?—Yes.

3304. Do you know the condition of the other parishes adjoining your district; have they waterclosets in the same proportion that you have?—Yes, they have, with the exception of Bethnal Green. I do not think they have got quite the same facility that we have, but the same system is being pursued as with us; they are going on.

3305. Are they abolishing cesspits and substituting waterclosets?—They are in all the adjoining districts.

3306. Are the vestry of your parish owners of all the dust?—Yes.

3307. Do you lease it to contractors?—Yes, and it will bring us this year 550*l.*

3308. If the dust was mixed with cesspit matter, would it bring you in as large an income?—We should have to use the whole of it and we should have to pay to get rid of it.

3309. Where a watercloset is used the dust is valuable, but if a cesspit is used the dust becomes of no value?—If we were to mix the soil and the dust together, then the two would have no value.

3310. But the dry dust is valuable?—Yes.

3311. It produces you 550*l.* a year?—Yes, and not only that, but we actually get 500*l.* for the concession.

3312. Which is an available sum, instead of having to levy a rate for that amount?—Yes; if we were to mix the dust with the soil, I think it would cost us 2,000*l.* a year to remove it.

3313. This arrangement is, in your opinion, an advantage to you to the extent of 2,500 a year?—Just so.

3314. (*Mr. Harrison.*) Have you abundant means of supplying the poorer parts of your districts with water?—I think it is very defective.

3415. How are the people generally supplied; what means are there of collecting water?—A kind of receptacle is used in the poor districts, but they are very poor things indeed, such as half a butter firkin very frequently, or a broken tub; cisterns, as a rule, are not to be seen—not proper cisterns in the poorer parts of the parish.

3316. Have you taken the trouble on any occasion to ascertain the volume of water which these people have the means of collecting when the water is on?—I am just now testing it. I have had a tank made which I am having moved from house to house, to measure the actual quantity of water supplied to them from day to day, but up to this time I am not able to give you any information. When I have completed my examination I will send you a report. I am going through the whole of the district I have referred to at the instigation, or rather at the request, of the united vestries that I have spoken of.

3317. What is the smallest quantity you have yet met with?—The quantity stored is not more than 10 gallons per house for a whole house.

3318. Do you mean for a house containing nine or twelve persons?—Yes, most of them contain as many.

3319. That is quite inadequate, is it not, for the supply of so many persons in a house?—Yes.

3320. Where do those people obtain water from for their necessary purposes?—I cannot imagine. I think it must be their habit not to use water to wash their houses with or themselves, and the little they use is to make the tea they drink.

3321. (*Chairman.*) Supposing that your parish had parliamentary power or other authority to deal with a company on behalf of the whole of the inhabitants to supply water to them, having power to levy an adequate rate, and that the means of supply were at your disposal stored in a cistern or other arrangement, do you think you could so map out your district and so control the supply, purchasing in bulk, as to give them a very much better supply than they have now, and at a cost not much greater?—I think we could give them a better supply than they have now at less cost, and a constant supply.

3322. If your parish had that power and gave you the necessary assistance, do you see your way to managing the distribution of the water, so that it should neither be wasted on the one side nor be scanty on the other?—I do. I think there would be no difficulty in it whatever.

3323. You would be supplying water to the whole at a very much less cost than each individual could obtain it for himself?—No doubt of it, taking the ordinary price which the company are permitted to charge—sixpence per 1,000 gallons—and applying that to the consumption of an ordinary household, I am satisfied that we could distribute the water much to the benefit of the water-ratepayers.

3324. Then the distributing apparatus being the property, or rather, if not the property, under the absolute control of the vestry, so that you might dictate the best form of apparatus, you could give those poor creatures an abundant supply, and it would not cost them more than it costs them now?—That is my impression.

3325. And it would be clearer water?—Yes.

3326. You would see that the tanks were kept clean?—I should not put up a tank in a house at all. I am now making an application to the company for permission to put up a block of houses of my own, and I propose to put a cistern in the centre, the water to be supplied by meter to that cistern, and then I shall supply my tenants.

3327. I meant, that each house should have a full supply, but you would make such an arrangement that you would be able to supply it to them at a much less cost than putting a cistern in each house?—Yes; and there would be no waste.

3328. (*Mr. Harrison.*) Would there not be an advantage as well in case of fire, from having a tank such as you describe?—Yes. We know that a pail of water would frequently extinguish a fire, when for want of it a house is destroyed.

3329. Would you put the tank at such an elevation as to be able to throw water over the houses in case of fire?—No, I should not be able to do that; it must necessarily be at the tops of the houses to throw it on to a house on fire, and I think it would not be advantageous for a water supply to the inhabitants, the pressure would be greater than was necessary, which would consequently lead to waste.

3330. In the case which you mentioned just now of there being inadequate means for the collection of water, and where the poor inhabitants had only 10 gallons to a house, was a house charged for the water supply according to its rental?—Yes.

3331. It was no fault of the water company that the supply was not larger, but from a defective arrangement in the house; it was the landlord's fault?—Precisely so. I believe there are many instances in which the time for which the water is turned on is inadequate for the supply. I know that there are many instances where the time for which the intermittent supply is on is not sufficient for the Saturday and Sunday requirement.

3332. How do they arrange the length of time for which the water shall be turned on?—What the plan is I do not know, but it appears to be for about 20 minutes; that seems to be their regulation, that each district shall have the water supplied for that time.

3333. Are many of the poor people in your neighbourhood employed in such a way that none of the family are left at home?—No; it frequently happens that the children are locked up in the rooms, while the parents are out, the whole day.

3334. How is the water kept in those houses?—It runs into a tub in the back yard.

3335. When that tub is filled what becomes of the overflow?—It runs to waste.

The witness withdrew.

Adjourned to Tottenham on the 18th instant.

TOTTENHAM.

W. Hall, Esq.

18 Dec. 1866.

Tottenham, Tuesday, 18th December 1866.

PRESENT:

ROBERT RAWLINSON, ESQ., C.B., IN THE CHAIR.

JOHN THORNHILL HARRISON, ESQ. | Professor JOHN THOMAS WAY.

WILLIAM HALL, Esq. (Tottenham), examined.

3236*. (*Chairman*). Are you chairman of the Local Board of Tottenham?—I am.

3237*. How long have you been resident in Tottenham?—32 years.

3238*. How long have you been connected with the local board?—As medical officer I have been connected with it more or less from its formation.

3239*. Has the local board carried out certain sewerage works, waterworks, and house drainage to a considerable extent?—Yes.

3240*. Do you know what becomes of the sewage after it leaves the sewers?—It passes into our works.

3241*. Have you any disinfecting works?—Yes.

3242*. Can you give the Commission any general statement as to the health of the district before and after the works had been carried out?—I can most decidedly. I made a report, which perhaps came under your notice before those works were introduced.

3243*. Have you a copy of that report here?—I do not think I can refer to it, but it was sent to you, for I observe that in some of your reports you have made extracts from it.

3244*. What was the character of the disease that prevailed in this district before you undertook your works?—Endemic fever was certainly the great characteristic of this locality.

3245*. Since you have carried out your works have you any reason to believe that the health of the inhabitants has improved?—Vastly; for the first few years after the completion of those works I thought we had almost banished fever, but within the last four or five years we have been suffering from overcrowding, which has brought it amongst us again, but it does not haunt the same localities that it did before the works were completed.

3246*. Do you think that fever is now more attributable to overcrowding than to any other cause?—Decidedly.

3247*. Can you briefly describe the locality in which fever now prevails, if there is any?—We have just got a few cases, but it is nothing now in comparison to what it was. The locality in which we have it principally is in the district where some speculating Jew builders have run up a number of miserable habitations, where there are in some 16, 18, and 22 persons living in little four-roomed houses—the Whitehall estate, I think it is generally termed.

3248*. Have you not, as a local board, power to regulate the mode in which the houses shall be erected?—No.

3249*. Are not the plans submitted to you?—Yes, but we have no power to say of what area the rooms shall be.

3250*. Have you no power to say how many inhabitants shall live in them?—We have, I believe, under a recent Act of Parliament some little power.

3251*. The last Public Health Act gives you additional power?—We expect that, but we have not put it in force just yet.

3252*. Have you framed your byelaws?—Yes.

3253*. In accordance with the regulations provided by the Local Goverment Act Office?—Yes.

3254*. Have they been confirmed by the Secretary of State?—Yes.

3255*. I assume that they do not give you sufficient power to prevent overcrowding?—No.

3256*. How are the common lodging houses regulated?—Very well.

3257*. Are they looked after by the police?—Yes.

3258*. Until recently the law allowed you to regulate a common lodging house as to overcrowding?—Exactly so; we have not tested the law upon that point yet.

3259*. Not under the new Act?—No.

3260*. Do you compel the landlords of the houses to take a supply of water from your works; do you serve them with notices?—Yes, we have power to do that, but occasionally where we have known of it, there has been a great difficulty in providing the supply of water that we could wish to have; when we have known them to have a supply of their own, we have not enforced it. I think it is now pretty general.

3261*. Have there been any complaints of the want of a water supply in any of those places where fever has prevailed, or has it been fostered do you think by the want of a proper water supply?—Upon this very estate to which I have alluded the owners are enabled to evade us. The Act says that they shall have a water supply, but not what supply; they will put on a half-inch pipe perhaps for 30 houses, and you may guess from that how much each house can get.

3262*. Have you had any complaints made as to any pollution taking place at your outfall works?—I may say that there have been numerous complaints.

3263*. Have any complaints been made by the river Lee trustees as to the condition of the outfall water before it goes into the river?—There are certain proceedings pending now upon that point.

3264*. Have the river Lee trustees given you notice of action to restrain you from letting the overflow pass into the Lee?—Yes, and the clerk to the board will give you evidence upon that point.

3265*. Have you been at all interfered with in your works by anything that has been recently done on the river Lee, either by the trustees or by the East London Waterworks Company?—We are seriously interfered with just now by the river Lee trustees. they have obtained a sort of *ad interim* injunction.

3266*. Have any public works or intercepting conduit interfered with you at all?—There is an intercepting ditch for the drainage of the parishes above us, which is a great nuisance to this parish. I believe it was made by the East London Waterworks Company, it is what we call the Catchwater Dyke; it comes from Ponder's End through our parish, and is emptied into the river Lee just above our own works.

3267*. Do you take any water from the Lee for your supply?—No; we do not unfortunately; we take it from wells.

3268*. (*Professor Way.*) Is the water hard?—No; it is water from a deep bore-hole.

3269*. Why did you say "unfortunately"?—Because it has put us to much greater expense, for the river Lee trustees have not been accommodating to us.

3270*. (*Chairman.*) You do not get so much volume?—We think that we ought to have some advantage from the Lee.

3271*. (*Professor Way.*) You cannot take it on account of the opposition of the River Lee Trust?—The East London Waterworks Company I believe have an engagement with the River Lee Trust, and the New River Company too.

3272*. You could not have the river water if you wanted it?—No; not under the present arrangement.

3273*. (*Chairman.*) Are you aware that the New River Company have power to supply water from the river Lee to the adjoining parishes for a considerable

district upwards, far beyond you?—I do not know what area their powers extend over.

3274*. Have you ever entered into any negotiations with the New River Company as to a supply of water?—Yes, and with the East London Waterworks Company too.

3275*. Did both negotiations fall through?—They did on account of the charge. The New River Company does supply the outlying portion of our parish now; the Wood Green portion of it.

3276*. (*Professor Way.*) Do you remember the old works for precipitating the sewage when Mr. Higgs introduced them?—Yes.

3277*. Was that any time before these works were put in hand?—No.

3278*. Were the two things going on simultaneously?—Yes.

3279*. Are those precipitating works in operation now?—Yes, in a modified form.

3280*. It is upon that that the injunction hangs, is it not?—Yes; we have recently sewered the Wood Green district, which is a very populous district indeed, on the other side of the parish. We had made arrangements to deal with the sewage at our works as well as with the sewage of this part of the parish, but the river Lee trustees say, "You shall not bring any addition to the works there," and it is on that question that it turns. The sewers are all laid down, and the parties have made their connexions, but they cannot use them.

3281*. Then the law proceedings do not affect your original works?—No.

3282*. (*Mr. Harrison.*) You stated that the effect of your sewerage works had been to improve the general health of the parish of Tottenham. Have they also diminished the death rate of the parish?—I should say that they have, but our death rate depends a good deal upon this circumstance perhaps: this is a parish to which many little foundlings are sent out of London to be nursed, and the number of them that die add of course very much to the number in the mortality table; but even with that addition our death rate is much below that of London.

3283*. I understood you to say that the improvement in the public health was attributable to your having taken the sewage away?—Unquestionably.

3284*. That does not touch the question of what the state of the public health might be in the neighbourhood of the sewage works where the sewage was dealt with?—No.

3285*. (*Chairman.*) Have you any idea of the number of deaths that annually take place among the children so sent into the parish and not born in it?—I really could not be certain, but I have seen a great deal of it.

3286*. (*Mr. Harrison.*) Your position is this, if I understand you, that the percentage of deaths is always very large during infancy, or that among children under five years of age there is a very much larger proportion of infants in consequence of foundlings and illegitimate children being brought into the parish than would ordinarily be found in parishes where there was no such unusual influx?—That is the case, I think, in most of the parishes in the neighbourhood of the great metropolis. I believe the death rate is not a fair criterion of the health of this parish.

The witness withdrew.

Mr. William Heath (Tottenham) examined.

3287*. (*Chairman.*) You are a solicitor practising in Tottenham?—No; I practise in the city, but I am clerk to the board of health here.

3288*. What length of time have you been clerk to this board?—For about 15 years, from its first establishment in 1850.

3289*. For what length of time have you known Tottenham?—For about 20 years.

3290*. Do you know the river Lee?—Yes, very well indeed.

3291*. Do you know it sufficiently well to be able to speak to its condition before the works were carried out here?—Yes, I do.

3292*. In what condition was it then?—I should say that as far as this parish is concerned the amount of filth and drainage of various kinds which flowed into the Lee was larger than it is now. The ditches were in the worst state generally.

3293*. Was the refuse from the houses at that time passed into the ditches, and so sluggishly passed down those ditches into the Lee?—Yes; the overflow. The place was sewered by the old-fashioned cesspools, and the overflow from them found its way into open ditches, and discharged itself into the Lee navigation.

3294*. The overflow being in a putrid condition?—Yes.

3295*. After festering in the surface ditches it slowly crept along and got into the Lee ultimately?—Quite so.

3296*. The Lee was then more foul than it is now?—Yes, it was.

3297*. Have you any idea what addition has been made to the population since the local board was established?—I think nearly 50 per cent. Its population in the last census but one was about 9,000; that was in 1851, and in 1861 it was 13,000. In some instances I may say that the drains were made from the houses into those open ditches, so that it was not simply the overflow from the cesspools.

3298*. That was before the board was established?—Yes. In 1851 the population was 9,120, and in ten years afterwards, at the last census, in 1861, the population was 13,239.

3299*. Can you form any rough estimate as to what it is now?—I think it has increased very largely indeed, and particularly in the Wood Green district; it is not less now than 16,000.

3300*. The Lee, I suppose, is navigable through Tottenham?—Yes.

3301*. Does the East London Waterworks Company take its water below you?—No, above Tottenham; it is not affected by the state of the river Lee in Tottenham.

3302*. The parties who have been indicting you are the River Lee Trustees, and not the East London Waterworks Company?—Yes.

3303*. Are the East London Water Company joining with the River Lee Trustees in the proceedings?—I am not aware that they are; I hardly think so. The Trustees have already filed their bill in Chancery, and have obtained an interim injunction pending the hearing of the cause, which will take place in a few weeks. The interim injunction does not extend to the drainage of the parish generally, but simply to the Wood Green district. We laid out about 7,600*l.* in sewering that district; it is now an outlying district, but the population has increased so rapidly within the last few years that it became necessary to provide some drainage for that locality as well, and the board laid out the sum of 7,600*l.* in laying down a main sewer from their works to Wood Green. We were about commencing to connect the houses with that main sewer when we were stopped by the interim injunction.

3304*. Can you state about the date at which the board commenced their works, and the sums of money they have borrowed?—We commenced the works shortly after the board was established; the first thing we did was to obtain a plan on a large scale, laid down by the General Board of Health, of the entire district and that occupied something like nine months. The board was established in 1850; the works, I think, were in operation in 1852, and the main sewer was laid down in that year. Of course it took some time to make house connexions, which were made about the year 1853. Mr. James Pilbrow was the engineer then.

3305*. Did he devise the main sewerage and the waterworks?—Yes.

TOTTENHAM.

Mr. W. Heath.

18 Dec. 1866.

3306*. How much money did you borrow for the waterworks, and the main sewerage, road improvements, and paving?—About 55,000*l.* and some odd pounds, including the roads.

3307*. What is the rateable value of the parish?—The rateable value in May 1850 was 42,816*l.*, and the rateable value in May 1861 was 58,047*l.*

3308*. Is it annually increasing?—Yes.

3309*. As you add new buildings and bring new property into operation you add to your rateable value?—Just so; it has increased in the last half year about 6,000*l.*; but that is hardly a fair criterion of the gradual increase, inasmuch as the Union Assessment Committee, appointed under the recent Act, held their sittings in Tottenham some time ago, and the assessable value of the bulk of the parish was considerably raised; therefore it can hardly be taken as a fair criterion; it does not show the gradual increase.

3310*. That gives an explanation of the sudden increase?—Yes, of 6,000*l.*

3311*. Has anything been done in your opinion to interfere with the efficiency of your sewerage outfall works?—The filing of the interim injunction has put us to very serious inconvenience, because as new houses are being built they have no means of drainage, and they are obliged temporarily to make small cesspools in the hope that something will be done.

3312*. Has anything been done in the way of works to make these works of yours less efficient than you think they were formerly?—Certainly not, they are as efficient now as ever.

3313*. I suppose you treat the sewage with lime, and take the sediment deposited out of the tanks?—Yes, the solid matter does not go into the navigation.

3314*. Have you been at all troubled with sewage and filth from the Catchwater Dyke from Enfield and Edmonton?—Yes, we have a good deal; a large quantity of filth comes down from there.

3315*. Does that pollute the river?—No doubt of it, very materially.

3316*. I suppose, if they deal fairly with all parties, they will indict the local boards of Enfield and Edmonton?—Certainly, and I may remark here that I am sorry the Commissioners had not an opportunity of inspecting the river Lee about a month or six weeks ago, when the water was drained out. If so, they would then have seen whether the nuisance complained of by the trustees resulted from the operations of our board, or what the real cause was. Between the outfall of this Catchwater Dyke and the works of the board there was an immense amount of filth in the bed and on the banks of the river between where the Catchwater Dyke enters the river Lee and our works

3317*. And some from Enfield and Edmonton?—Yes, and Ponder's End, not from our works, but all above our works. I would suggest to the Commissioners that they should apply to the trustees of the river Lee to have the water drawn off that they may see the condition of the bed.

3318*. Is the tenor of the injunction to restrain you altogether from passing your sewage into the river Lee or to restrain you from passing any additional sewage into the river?—It is to restrain us from passing in the additional sewage from the Wood Green district.

3319*. Your offence is not that you are going on as you have heretofore been doing, but that you wish to add to the original amount of that drainage?—Yes.

3320*. (*Professor Way.*) Do you propose to increase your means of dealing with the sewage, so as to comply with the terms of the injunction?—Yes, we have purchased an additional quantity of land, some of the surplus land belonging to the Tottenham and Hampstead Railway Company, and we bought it for the express purpose of constructing depositing tanks, and so forth, all of which will appear on the affidavits.

3321*. (*Chairman.*) Have you inspected the irrigation works at Croydon or at any other place?—I think our surveyor has, and I believe some of the members also have been there; I have not.

3322*. Have you at all discussed at the board that mode of disposing of the sewage?—Yes, it has been frequently discussed by the board, and an experiment has been made on a small scale, but I believe the opinion of the surveyor is that there would be some difficulty attending it on account of the peculiar nature of the soil, it being stiff clay. I know that that has been the prevalent opinion amongst persons generally.

3323*. Does land bear a very high relative value here for agricultural purposes?—Rather so.

3324*. Land immediately outside the town would fetch a price beyond its agricultural value?—Yes, it is looked upon, in fact, as building ground.

3325*. Should you have any difficulty in getting the necessary quantity of land?—Yes, extreme difficulty. I do not see any land that is available except the marshes, and some pumping apparatus would be necessary.

3326*. I suppose we may say that as a board you have not taken that question up very seriously?—No, but we have found the difficulty so great in obtaining land that we thought it almost hopeless. We have made applications to the Metropolitan Board of Works to take us into their system of sewerage.

3327*. Have you made a written application to that board?—Yes, there is an application pending now. A letter was laid before the Metropolitan Board of Works last Friday.

3328*. Will you furnish this Commission with copies of your applications and of any written replies you may have received?—Yes.

3329*. Can you state now the tenor of their reply?—We have received no written replies at present; the negotiations have been principally through our surveyor up to this time, but a short time since the matter was very serious, the question of the drainage of this and the surrounding districts has been considred, and this board called a meeting of the surrounding parishes, some eight or ten of them, to consider the general question of the drainage of that particular area. A committee was appointed to consider the question, and a meeting of the committee was held about a week or 10 days since, but only four of the parishes then united in the matter; the other parishes, from various causes, withdrew after the original meeting, and there were, I think, three parishes, and the visiting committee of the Colney Hatch Lunatic Asylum, who united in making a general application to the Metropolitan Board of Works for permission to allow Mr. Bazalgette to give an opinion as to the best means of draining the three parishes of East Barnet, Tottenham, Hornsey, and the Colney Hatch Lunatic Asylum, which I should state had been complained of very much by the Edmonton board as having been a source of great nuisance to that parish and a small part of our parish.

3330*. Are you of opinion that a combination of the parishes and townships in the district would be the most effectual method of carrying out the intercepting works that might be found necessary?—Decidedly so.

3331*. Do you think, with your knowledge of the legal powers which exist, that it would be necessary to have any new machinery to bring all the parties concerned in?—Yes; I am afraid that there are no existing powers to enable it to be done, and that it would be necessary to obtain an Act of Parliament.

3332*. If the river Lee in its entirety were put under a conservancy board with a view to suppress nuisances throughout its length and breadth, and to compel combined action, do you think that would be a benefit?—Yes.

3333*. If the necessary works were carried out in the most effectual way?—Yes.

3334*. With combined action on the part of a number of parishes which might enable them to carry out more efficient works than if they acted singly?—Yes, quite so. I imagine it would be necessary in that case to take in the whole valley of the Lee from Hertford, and not to confine it to the few parishes that were assembled together. We confined our operations to those parishes the fall of which is

through our own parish, and which were suffering with ourselves, and being joint sufferers we limited our inquiry to those particular parishes. In my opinion any general scheme should embrace the whole valley of the Lee.

3335*. Did you find difficulties in dealing with the small number of parishes which are affected like your own?—Yes, and so great that I think they are insurmountable, nothing but action on the part of the Government, which would compel parties to come in, would be effectual.

3336. (*Professor Way.*) In that case you would be independent of the metropolitan system altogether?—Quite so, that is, if they refused to take us in. Looking at the large increase of the population that is likely to spring up within their present area, I believe it is thought that their sewers are not sufficiently large to take in sewage from other districts. I believe that that is Mr. Bazalgette's opinion.

3337. (*Mr. Harrison.*) How far does that intercepting sewer extend up the valley of the Lee?—It comes down I believe from Ponder's End to Tottenham Mills, about a quarter of a mile above our works.

3338. The district throughout the whole distance between this and Hertford is becoming populous by degrees?—Yes, and of course the nearer you come to London the more rapidly the population is increasing.

3339. The houses are almost continuous now to Hertford, are they not?—Hardly so, but as far as Ponder's End they are. I may mention that there is a very large amount of filth, which flows along the ditches into the river Lee between this and Hertford, from Waltham, Cheshunt, and Ponder's End.

3340. Have any complaints been made by your board to the East London Water Company as to the intercepting sewer?—No; it was made by virtue of an Act of Parliament, and we did not think it was worth while to make any complaint upon the subject; there was a special Act passed, although we think, perhaps, that the powers given by the Act have been exceeded. No doubt the intention of the Catchwater Dyke was to provide for the drainage then existing; it did not contemplate carrying the sewage directly into the Catchwater Dyke.

3341. That not only takes the sewage but the flood water of the district above?—Yes.

3342. So that all the water falling upon the district adjacent to that passes into it, and into the river Lee, below the point from which the East London Waterworks Company take their supply?—A great deal of it does—that which is not carried off by the other ditches and streams.

3343. (*Professor Way.*) Is any use made of the Lee water below Tottenham for domestic purposes?—To a certain extent I understand it is.

3344. It does not furnish a water supply of any consequence?—No; not on any large scale.

3345. The complaint against you would be, not of fouling the water for the supply of the town, but of a general fouling of the water?—Yes.

3346. The injunction which is pending refers to the question of the Wood Green sewage?—Yes.

3347. And that will be tried on its merits?—Just so.

3348. If that decree is made perpetual will that affect the question of your other works or will it not in point of fact condemn the principle?—It would place us in a difficulty, as one part of the parish only would be drained, and in fact a great portion of the expense which has been incurred in draining the other part of the parish would be rendered futile.

3349. You have done something with the Wood Green district other than the method you are pursuing in the other?—Yes.

3350. If the Vice-Chancellor should decree that you shall not do what you have already done with the rest of the sewage, shall you not have to resort to some other plan?—Yes.

3351. You will have two systems under your jurisdiction; dealing with the sewage by precipitation has been condemned inferentially, and probably the improved method of dealing with the sewage in the case of Wood Green will be prohibited?—Yes.

3352. Will not that be a very awkward condition of things for you?—Yes, very awkward indeed. The fall from the Wood Green district is entirely in this direction, and if that is drained by the old system of cesspools, the overflow must get into the ditches and contaminate them, and a large portion of the expense incurred will be utterly useless. I think there ought to be a general system of some kind applicable to the entire parish.

3353. When were the works that have been executed first carried out?—Some few years after the board was established. I think in about 1854.

3354. Twelve years ago?—Yes, just after the house drainage was carried out, and private improvements. In the first place we laid our main sewers and our water mains simultaneously.

3355. Were they arranged for the probable increase in population?—Yes; a certain amount of increase of population was anticipated, I believe, by Mr. Pilbrow, but not sufficient to meet the requirements of the case. We have had to increase our works, and to enlarge some of our water mains.

3356. I am referring to the precipitating works?—They have not been enlarged.

3357. Have you found any difficulty from the size of them with the increased quantity of sewage consequent upon the increased population?—I think they would be improved if there were some additional depositing tanks, and we have recently bought about an acre of land for that purpose.

3358. Was that with reference to the Wood Green district?—Yes, and to the district generally.

3359. (*Mr. Harrison.*) Was it proposed by you to deliver the sewage after passing it through the process into the river Lee by a new outfall?—No; by the present outfall, there is only one.

3360. (*Professor Way.*) Do you consider that you have a prescriptive right to carry the drainage into the Lee?—Yes; we have a prescriptive right to take the drainage into the river Lee; it always went there. We say, as far as this particular parish is concerned, that the amount of filth which goes into the navigation is far less now than it was at the time of the establishment of our works. I ought to mention as to the Wood Green district that before this sewer was laid down recently all the drainage from the Wood Green district was passed through our ditches into the river Lee. That was before it became increased by the increase of population, and I should not give a complete idea as to the drainage of Wood Green, unless I said that a much larger quantity of drainage comes down our ditches from a large part of the parish of Hornsey and South Hornsey. That was the subject of the lawsuit between this board and the sanitary authorities at Hornsey sometime ago. We filed a bill against them because the nuisance had become so intolerable, and a large amount of sickness had been caused at Wood Green by a large sewer that they carried out in connexion with the Muswell stream, and we filed the bill against the sanitary committee. Unfortunately there was no local board established there, the sanitary committee being the only committee chosen and appointed under the Nuisances Removal Act. When the case was called on before Vice-Chancellor Wood, the difficulty that we experienced was this, that there was no public body against whom we could proceed, and the law was in such an imperfect state, that all the Vice-Chancellor could do was to make a general decree that the local authorities at Hornsey should bring no additional sewage through Tottenham. But we were obliged to put up with the existing sewage, which was a very great nuisance; this was before the passing of the recent Act, but under that Act we shall probably have enlarged powers.

3361. Is not that an additional reason why some general legislative measure should be passed for a conservancy of the entire river Lee and its tributaries?—Yes, decidedly so, because that nuisance which is

TOTTENHAM.

Mr. W. Heath.

18 Dec. 1866.

very great now is increasing every year from increase of population.

3362. Are you not doing for Hornsey what the river Lee trustees are doing for you?—Not now; we were doing so. We took proceedings against them, because we thought that the complaint which was made by the trustees of the river Lee arose, not so much from what we were doing as from what other persons were doing, because they sent their sewage through our parish.

3363. Is there anything further that you think you can add to your evidence?—I think not.

The witness withdrew.

Mr. Peter P. Marshall, C.E. (Tottenham), examined.

Mr. P. P. Marshall, C.E.

3364. (*Chairman.*) You are surveyor to the local board of Tottenham?—Yes.

3365. How long have you acted in that capacity?—For about nine years.

3366. What is the area of the parish of Tottenham under the jurisdiction of the board?—4,624.

3367. It is a very large area?—Yes.

3368. Are the whole of the highways within the parish under your charge?—Yes.

3369. Do any turnpike roads pass through it?—Yes.

3370. You have nothing to do with trustees of roads?—No; we have not.

3371. You have a system of sewerage I assume in Tottenham?—Yes.

3372. Was that laid out in the first instance by Mr. Pilbrow?—Yes.

3373. Has there been any other surveyor between him and you?—No, there has not.

3374. You have taken up the works as they were left by Mr. Pilbrow?—Yes.

3375. All that has been done since you have done?—Yes.

3376. Were you surveyor at the time when Mr. Higgs devised and carried out his disinfecting works?—No; they were in operation when I came here. Mr. Higgs was then living, and carrying on the works.

3377. Do the works remain now as they were established by him?—Yes.

3378. Was there not a large liming tank in which he treated the sewage?—Yes, and that is there now; in fact, everything stands as he left it.

3379. Is it used now as it was then?—No.

3380. You do not use the large liming tank?—Not the upper one.

3381. Do you carry on the liming and disinfecting process in a similar manner to what he did under the terms of his patent?—No; it is not the same, we do not use the upper tank, but we put in the lime.

3382. Do you use disinfecting material in a similar manner, and as much?—Yes, quite as much.

3383. Do you know what price Mr. Higgs anticipated getting for the sediment when the sewage was so treated by himself in the first instance?—I think it was about 5*l.* per ton that he expected to get.

3384. Was any of it sold for that price?—I believe there was. When they sold us the works we sold the remains of deodorised sewage that were left there when Mr. Higgs' people broke down. There was a very large quantity in various forms left on the premises, and they said they would like to take it away, and there was a sale by auction, but I believe that the amount that was got for the whole did not pay for the expenses of the auction.

3385. The trustees of Mr. Higgs' estate asked for leave to dispose of it, and it was sold by auction?—Yes; I should mention that the whole affair fell into the hands of Messrs. Baxter, Rose, and Norton, who supplied the funds to establish the process, and when we bought the works from Mr. Baxter he said that he should like to have the remainder of the manure disposed of, and we ordered Mr. Richards, the auctioneer, to sell it, but it appears that he said that the less we said about it the better, for there was not enough received to pay the auctioneer's expenses.

3386. Do you know upon what terms the works fell into your hands?—We bought them absolutely as they stood.

3387. Did you pay anything for the patent right to use the disinfecting material?—No; it was not asked for.

3388. Do you know what proportion the sum paid by you bore to the first cost of the works, did you pay the first cost, or only a part of it?—We paid nothing like the first cost.

3389. Do you know what the first cost was?—No further than that Mr. Baxter said he had spent upwards of 2000*l.* I think we gave 500*l.*; the land belonged to the board.

3390. You had allowed Mr. Higgs to put up his works there?—Yes.

3391. You gave 500*l.* for all the buildings as they stood?—Yes.

3392. And you have gone on using the ordinary liming tank since?—Yes.

3393. Do you dispose of the sediment now for agricultural purposes?—Yes, we do.

3394. Do you know what weight you take out per week, or month, or year?—Not exactly; but the quantity does not come to very much. I think we have got out perhaps 50 tons when we cleaned it out, and we thought there might be from two to three tons a week.

3395. That would make about 100 tons a year?—About that; that is weighing it when it is rather dry. The sewage deposit loses in weight very considerably by drying.

3396. Have you any difficulty in getting rid of it now?—No, not when it is ready to cart, but we cannot get any remunerative price for it.

3397. What do you get for it?—We generally sell it in a heap to any person who is handy to cart it away, and they will give from 5*l.* to 8*l.* or 10*l.* for it, according to the quantity we have.

3398. Does that amount to 1*s.* or 1*s.* 6*d.* a ton?—Perhaps that, or 2*s.* 6*d.* We extract a great deal before it passes into the tank, which is rather valuable manure; it has never been treated with lime, it is fresh, and it is considered more valuable than the other part.

3399. How many gallons of sewage a day on the average have you to deal with?—The amount varies at different times, but the pipe is an 18-inch pipe, and taking it as running at about 13½ inches of water, that gives about 700,000 gallons in 12 hours.

3400. Is it running all the 24 hours?—Yes; sometimes it is not so high as that, and sometimes it is fuller; in wet weather it sometimes runs quite full; in the summer time I have seen it considerably below that, probably delivering only half that quantity.

3401. Have you any means of dealing with the full pipe of your settling tanks, or do you allow the sewage to run through the tank?—Yes; lately we have, right into the river, in the same way as the other does.

3402. It takes its chance of taking out the sediment then?—Yes; through a sort of filter that we have.

3403. Is the liming process carried on night and day?—No.

3404. What power have you at work in mixing the lime?—We throw the lime into a little tank outside, and it mixes itself in with the sewage.

3405. What weight of lime do you use in a day or a week?—In the summer time we use more than in the winter time. I think in the summer time it is a cubic yard a week.

3406. (*Professor Way.*) Does that weigh half a ton?—Yes, quite that; that is in the very worst period, the hottest time; we used more this year than ever was used before.

3407. (*Chairman.*) From what amount of popula-

tion does the sewage flow into and through the tank?—From the whole population of the lower district, we estimate it at about 7,000 or 10,000.

3408. What number of watercloseets would there be for that population?—There is a watercloset on the average to every house, with the exception of the very small ones; sometimes we have a watercloset to two or three or more houses; but I think I might say there are 2,000 watercloseets.

3409. Connected with that system?—I think so. This is a survey that I made of the old works with a sketch of some proposed new tanks (*handing in and explaining the same.*)

3410. (*Professor Way.*) Is the lime put in by hand?—Yes; there is a man there both day and night.

3411. And you get a quantity of solid matter in the tank?—Yes, it very soon fills up.

3412. (*Chairman.*) What can you get a ton for it?—We sell them the two; a man will not take the one without he gets a little of the other, and we sell them off in lots.

3413. How much a year does it cost you to work these outlet tanks?—It costs us a little more than the wages and the lime at present. I should say that it costs us perhaps 100*l.* per annum now.

3414. Does the lime cost you 100*l.*?—No, we employ a man, and we pay him about 12*s.* or 18*s.* a week; another we pay 1*l.* a week, the two together and the lime will come to about 150*l.* a year at the outside.

3415. What return does it make you?—Very little.

3416. 20*l.* a year?—Not much more than that; it is an unprofitable affair, if we had worked the tanks it would have been still more expensive.

3417. You mean according to Mr. Higgs' first process?—Yes, because the sewage has all to be pumped up into the upper tank.

3418. What is lime worth per ton in Tottenham?—About 1*s.* a bushel.

3419. How many bushels are there in a ton?—About 36.

3420. Does it cost you about 36*s.* a ton?—Yes, we use the ground grey lime.

3421. What do you pay for that a ton?—About 12*s.* a cube yard; that is about half a ton.

3422 (*Professor Way.*) You say that you sometimes use half a ton in a day?—Yes, during the summer throughout the parish.

3423. On the average do you use a quarter of a ton a day?—I do not think so.

3424. (*Chairman.*) Are there any cesspools remaining in that district, the greater part of which drains down to the outlet?—None almost.

3425. You may speak of that as the sewer drain and watercloset district?—Yes, completed.

3426. (*Mr. Harrison.*) Do not the New River Company carry out the same system of purification at Hertford?—I have not seen the Hertford works, but I believe they are somewhat analogous.

3427. Have you taken any opportunity of examining the effluent water from the Hertford works in order to compare it with the water from your works—No, I have not.

3428. (*Chairman.*) Have you ever tried sewage irrigation below your outlet?—Yes.

3429. Upon what area of land?—About 40 acres; we obtained the consent of the occupier to lay down some irrigating sewers, that was about two years ago.

3430. Did you supply the sewage by gravity, or had you to pump it?—We had to pump it up to a certain height, and let it flow by gravitation over the land.

3431. For what time did you continue the experiment, and at what time of the year?—We began, I think, in the beginning of the summer.

3432. Of what year?—It is now two years ago; in 1864 we pumped the water up through the main that we laid down for the purpose, and allowed it to flow through channels cut on the contour of the hill, on to stiffish clay soil, and the great difficulty was on the part of the people who owned the land; they would not allow the grass to be cut more than once, and they will only permit us to irrigate it at their will and pleasure. The application of the sewage has been very satisfactory to every person as far as both purifying the sewage material, and increasing the growth of the grass, but during the winter months, or indeed as soon as the occupier got the hay off, horses and cattle were put into the field, and they poached up all the ditches, so that we could not carry on the system.

3433. You irrigated the natural grasses of the meadow?—Yes.

3434. No particular cost was gone to to prepare it specially for irrigation?—Nothing but cutting the irrigating channels that were necessary to conduct the sewage along the contoured face of the hill.

3435. It was successful until it was interfered with by turning the cattle on during the winter; they trod down your channels, and paddled up the surface?—Yes, they made a mess of it; the occupier did not attend properly to it.

3436. If that small piece of 40 acres had been under your own control to deal with as you thought best, do you think you saw in that experiment results which might have been secured continuously?—I am perfectly certain of it.

3437. You could have got a large increase of produce and have carried on the works so as to purify the sewage?—Yes; if we had had a sufficient area of land, and had had it under our own control, it might have been adapted for the purpose very perfectly. Our sewage might have been cleared. There would have been no smell and a wonderful growth of grass.

3438. If that could have been brought about, I assume that you would have advised your board to apply the sewage to the land, and after that to sublet the land, and the sewage to be worked under stipulations that you might dictate?—Yes, that is the view I take of it, and, indeed, the only way is for the board to get possession of the land and make the necessary works, and then afterwards offer them to the highest bidder. I believe that they would receive a sufficient return to pay them for the expense.

3439. Would it not save them the present outlay they are making on disinfecting works?—Yes, I think there is no doubt of it.

3440. Would it not also prevent them from getting into litigation with the river Lee trustees?—Yes. The only difficulty is our close proximity to London. There is a most violent prejudice on the part of the people here against sewage irrigation, and not only amongst the people who live near it, but amongst the farmers generally in the neighbourhood; they will not use it. We offered to lay it on to a farmer's land, and he said that he was quite satisfied it would kill his crops if it was allowed to run over his ground.

3441. (*Professor Way.*) Your proximity to London will ultimately be an advantage to you as offering an outlet for your produce?—Yes, but that is more than counterbalanced by the terror that people have of it.

3442. But that, I should think, is only transitory?—I think not.

3443. (*Chairman.*) Have you witnessed the Croydon mode of irrigating land?—Yes.

3444. Recently?—No.

3445. Have you seen the irrigation as carried on at South Norwood?—No.

3446. Do you know that the sewage there passes on to stiff clay?—I believe it does. We found that the clay and the grass so clarified the sewage as to make it as clear as crystal—so clear that one member of the deputation tasted it, and could not taste anything in it; but the value of land here is so great that owners would ask for land for the purpose 1,000*l.* an acre, and they are so terrified and alarmed lest it should injure other places in the neighbourhood in a building point of view that if we are going to have a sewage farm I am sure we must get sufficiently far away from this neighbourhood.

3447. (*Mr. Harrison.*) If you were to carry the sewage towards the marshes would it be the same?—The marshes, being common land, are very much used for recreation grounds, and I apprehend there

TOTTENHAM.

Mr. P. P. Marshall, C.E.

18 Dec. 1866.

would be great difficulty in getting permission to turn them into sewage meadows, for then they could not be used as recreation grounds.

3448. (*Chairman.*) Any more than you could use them for grazing purposes?—No.

3449. You say that any smell there might have been in the sewage was immediately absorbed. Was it in the summer time when you carried out the experiment you have mentioned?—Yes, and we found that if the sewage was properly applied to the land there was no smell; if an excessive quantity was put on it ran forward and collected in pools from the inequality of the ground, and if not properly levelled there might be a smell then.

3450. (*Mr. Harrison.*) Are you aware that a bill is likely to come before Parliament in the ensuing session for the enclosure of these common lands, promoted by Mr. Bailey Denton, the engineer?—There is, I believe, a proposal to drain the valley, and he intends to go to Parliament to obtain a bill to drain some of the low-lying grounds in the neighbourhood of Stratford and Bow. I pointed out to him the advantage it would be if a large sewer was constructed there to continue it up the valley, and so take in the whole of the drainage on both sides. We pointed out the nature of our difficulty as we found it, and we thought the only relief would be to let the sewage be taken to Barking, and thence on to the Maplin Sands. Under these circumstances I believe he has given notice of his intention to apply to Parliament for a scheme to unite the whole of the parishes under one common board, and he proposed to go as far as Waltham. There we found that the East London Waterworks Company had devised a scheme to intercept the sewage of the valley on both sides, and we proposed to catch the sewage there and bring it down through the valley to Stratford, which pumps its sewage direct into the Lee now, and so on to Barking, that it might be dealt with.

3451. (*Chairman.*) Have you any plan showing any proposed works that you have to intercept and carry away the refuse sewage of your own district or the combined districts?—I have made a sketch (*producing the same.*) We find that we are exposed to three great evils.

3452. Have you laid down any scheme for dealing with the sewage upon any plan?—I have laid it down on this inch Ordnance map, which shows the whole of the district outside the metropolitan boundary.

3453. Where do your intercepting sewers begin, and where is it proposed they should end?—I will explain (*describing on the map*).

3454. Does your parish abut upon the metropolitan area?—It does.

3455. You are, like West Ham, just outside the metropolitan area?—Yes; it was proposed to intercept the Lee sewage as it flows from Cheshunt on the west side of the Lee, because the East London Water Company had in contemplation a system of sewerage to intercept the sewage above that, which would join this sewer about Waltham Abbey. We proposed to intercept all the sewage from Enfield, Enfield highway, and the various villages that lie on the main road to London, Tottenham, and Edmonton, and also to receive into the same sewer the drainage from Colney Hatch Lunatic Asylum, which is at present a matter of litigation, and also from Hornsey, which has no outlet in the way of drainage, from Barnet and other districts, there being a natural watershed towards the river Lee.

3456. From the west?—Yes. The eastern catchwater was to go up the eastern side of the river Lee, beginning at Waltham Abbey, to follow the river Lee and take in Sewardstone, High Beach, Chingford, Chapel End, Walthamstowe, and that district which is becoming rapidly populous with no means of drainage. Then it would form a connexion with the sewerage that had been brought from the west side of the Lee, and the two would unite in one channel at High Hill Ferry, upon the west side of the Great Eastern Railway.

3457. Through what district would it then go?—Through the town or village of Stratford, and direct across the Plaistow marshes.

3458. By an independent outlet would the sewage be carried to Barking Creek?—Yes, it would be low down enough to take all the drainage of the low lands there.

3459. To be discharged into the Thames at Barking Creek?—Yes; either into the Thames in the same manner as the metropolitan system does, or to lift it up by pumping into the Maplin Sands scheme, and so go to the Essex marshes.

3460. (*Professor Way.*) What volume of water do you imagine would be taken down in that way?—I have not calculated that.

3461. Do you know what provision is being made, beginning from Barking and going to the Essex Sands, as to the size of the culvert to be constructed?—I may remark that we do not propose to take the storm water.

3462. (*Chairman.*) Only the dry weather flow of the sewage?—Yes, and as little of the other as we can help. We consider, supposing the Maplin Sands scheme would not do, that it would bring us to a point where we could irrigate; it might be turned more to the north, and so get into the low lying lands of Essex.

3463. (*Mr. Harrison.*) Has this scheme assumed any definite shape?—We called a meeting, and notice was given of an application to be made to Parliament for a bill to enable all the parishes interested to combine and form a central sewage area. It was proposed that they should carry out some scheme, we did not say what, for the purpose of making an outlet for the whole of the district, and it was intended that they should all be rated according to their value, and it was thought that the powers of the present Act of Parliament would be enough to enable them to carry out the works. We had a meeting here in Tottenham of the persons who were interested in the matter, and we found after the meeting had taken place, that few of them were inclined to incur the expense of going to Parliament, or to take any course, and I believe that now an application has been made to the Metropolitan Board of Works to ask whether there is any prospect of getting an outlet into their system of sewers. Mr. Bazalgette has been requested to come down here and report upon the matter.

3464. Has the East London Water Company taken any steps to extend their intercepting system above the present point?—Yes, they have given notice, and have deposited plans for a new system of sewers, to have their outlet in the present Catchwater Dyke, which passes through our parish. They begin at Ponder's End, and take the sewer along the high road in Ponder's End towards Waltham Cross; they also take a sewer along the valley to catch the sewage from the Ordnance factory. They then cross the river Lee, and extend their sewage pipes to Waltham Abbey, so that their proposal is to bring all the sewage from Enfield, Ponder's End, Waltham Abbey, and that district, into the Catchwater Dyke that runs through our parish.

3465. Is that Catchwater Dyke complained of by the people in your parish now?—At times it becomes a considerable nuisance, and is complained of.

3466. When the water is low in the summer time?—Yes.

3467. Have you found it to be objectionable yourself?—Yes, and when the Government inspector saw it he said that he thought it was a very serious nuisance—Mr. Morgan.

3468. When was that?—In the last summer.

3469. In what month?—I think it was in July.

3470. Is it part of the East London Water Company's scheme to cover the sewer?—I do not think it is.

3471. If their proposal is carried out to bring sewage from places above Waltham, will not that increase the nuisance arising from the intercepting sewer?—Very much indeed.

3472. (*Professor Way.*) Are you aware that the Metropolitan Sewage Company propose ultimately to deal with the sewage in the whole line of their culvert?—Yes.

3473. Would it not be something like taking coals to Newcastle, to take your sewage to a place where the ground is already occupied by the metropolitan sewers?—Yes, but we cannot apply it here about.

3474. If the metropolitan sewage is diverted to the Maplin Sands, you would not be allowed to discharge your sewage into the river after that had been done?—No. I believe as to the Maplin Sands scheme, that they would be very willing to get more sewage than they have if another system could be devised. We cannot dispose of it so close to London as we are now, and if we tried to send it over the heights into Essex, we must pump it over.

3475. That is if you accumulate the sewage from a number of towns?—Yes; we have sketched out a plan for the purpose of disposing of it by gravitation, by intercepting it at certain points. Our outlet is very little above high-water mark.

3476. (*Chairman.*) Do you know about what length of main sewers you have in Tottenham now?—I cannot answer that exactly.

3477. Are the sewers permanently ventilated?—There is no ventilating apparatus, so called, beyond the connexion of the drain water pipes at intervals with the sewers at high levels, and that we find effects ventilation.

3478. Have you not found any necessity for permanently ventilating them?—No; we have found our sewers remarkably free from smell when opened, because the flow is so rapid through them.

3479. What is the size of the largest of them?—18 inches; it is an earthenware pipe.

3480. Are there any sewers made of brick?—None.

3481. Then Tottenham is entirely sewered by earthenware pipes?—Entirely.

3482. How many years have they been in operation now?—I suppose upwards of 12 years.

3483. Has there been any bursting in that period?—We have had a settlement in the small pipes frequently but not in the mains. We have had as many as upwards of 40 houses in one part of the district, which drained into a $7\frac{1}{2}$-inch pipe, and that was very liable to stoppage, so we removed it and put in a 9-inch pipe.

3484. I believe nearly all the roads throughout Tottenham, which is of great length, are macadamized?—The parish highways are of gravel; the main road is macadamized.

3485. None of the roads are paved?—None.

3486. I suppose there is a large amount of grit formed on the surface of the main roads by traffic?—Yes.

3487. Looking at the character of the district, which is tolerably flat, what is the fall in your outlet sewer?—Very slight; in one place it is one in 1,000, and in another one in 600.

3488. What is the fall generally in your other gradients?—They are all rather flattish; about 1 in 300 or 1 in 700.

3489. What number of gullies is there?—Not one; we do not permit any surface water to go in.

3490. You pass it into the natural watercourses of the district?—Into the old watercourses of the district.

3491. Do you find a difficulty in carrying it off?—Yes; as the district gets inhabited and population increases, it is a very difficult matter to preserve those old watercourses; indeed, it forces upon us a double system almost.

3492. Do you think that that double system would have its advantages if you had to deal with the sewage proper?—I think it would have in that respect.

3493. Does much subsoil water find its way into your system of pipe drains out of the gravel?—I apprehend that it does in those pipes which have been laid down in the old district. As to the ones I laid down I know that it cannot get in, because I laid them down to avoid that.

3494. You know what volume of water is supplied to the inhabitants for domestic purposes, and the quantity that issues from the sewer's mouth. Can you form a notion as to whether much additional volume finds its way into the sewers as compared with what is pumped into the district?—Yes, we sometimes have the pipe quite full.

3495. (*Mr. Harrison.*) Are you speaking of 12 hours?—Yes.

3496. (*Chairman.*) Are the down spouts from the houses connected with the drains?—A good number of them are; I think we get a good deal of water from roofs and yards that we cannot keep out altogether.

3497. When were your waterworks established?—I believe at the same time that the sewage works were.

3498. What did they cost?—The original waterworks consisted of a surface well bore-hole and a small pair of engines, by which the water was pumped into the main.

3499. Was the water drawn from the chalk?—Yes.

3500. Have the works been added to?—Yes; the next addition was made by Mr. Pilbrow, who put up a larger engine and sunk two other bore-holes in a place a mile distant from the former one; then he laid a perforated pipe in a bed of gravel, which underlies the upper clay in the valley, and brought all the water into a tank and pumped from that.

3501. What was the quality of that water from the gravel?—It was very hard and full of iron, so full that every pipe and everything we had was affected by it.

3502. Did you abandon it?—We had no other supply that we could go to except what we got from the surface bore-holes, that is to say, delivering all their water about 10 or 15 feet from the surface.

3503. Have you constructed some additional works?—We have made a new well. In the summer the water from the land springs fell off, and we sunk a well and put down a new set of pumps to the depth of about 65 feet, and we have pumped water from that source during the present year.

3504. Have you gone down into the chalk?—Yes, it is an 18-inch bore-hole at a depth of 260 feet; we have been pumping with a set of three-throw pumps, and in 42 hours we have raised, I calculate, 400,000 gallons.

3505. Is the supply pretty steady?—Yes, we keep the water down at that depth.

3506. Is it as much in volume now as when you first began?—We do not find any difference.

3507. It gives you a steady supply?—Yes, it stands at about what I have stated.

3508. Do you consider that these works are successful?—Yes, as far as they go.

3509. What did those works cost you?—Upon the whole they cost us 2,000*l.* The new well and pumps cost us 2,000*l.*

3510. And by these means you obtain 400,000 gallons a day?—Yes; the new engine was necessary independently of the well, as we had only one engine before.

3511. Are the pipes at all affected by the oxide of iron that you have mentioned?—Yes; I can show you hundreds of yards of pipe which have been destroyed by it.

3512. Do you use that ochrey water now?—During the summer we have very little of it to use; what little we get we use; we use a portion of it now.

3513. Does that affect the other water by mixing with it?—No, it does not; it is only after it stands for some time.

3514. (*Mr. Harrison.*) At what depth is that gravel bed below the surface?—From 10 to 16 feet.

3515. In what direction does it extend?—Right across the whole valley of the Lee. When the East London Water Company were making a catchwater reservoir, they had to cut through this and form a

TOTTENHAM.

Mr. P. P. Marshall, C.E.

18 Dec. 1866.

puddle trench; they put up temporary pumping engines, and the water in the trench was as clear as crystal, but when it was turned into the Lee, and had mixed with the other water, it began to turn red, and you could see a distinct stream of red water. I believe it is not unhealthy, but it is hard. When they have been pumping through the ditches, the water is coloured by a ferruginous deposit of clay.

3516. Had you much trouble in keeping that water out during the construction of the works?—Yes, considerable, for there was a great deal of it.

3517. Is there any communication between that bed of gravel and the river Lee itself?—I think not.

3518. Why?—Because I think that if there had been they could not have kept the puddle trench clear with their pumping power if the water had come in from the river.

3519. Does the gravel bed extend at all to the westward under the town?—We come always upon it before we reach the London clay. We are getting it now about half a mile from the river.

3520. How far westward from Tottenham across does it extend towards Hornsey?—The beds of clay are so thick there that we have not been able to trace it, but it evidently has a declination towards the west.

3521. Does it get deeper towards the west?—Yes; it has been traced down the whole valley of the Lee. It seems to have been originally washed down from some upper ground and deposited in the Lee; it is much rougher when you get to the bottom than it is at the top; of course the river's action can be traced upon it.

3522. At present you say you are prevented from carrying out a system of sewerage in the increasing part of Tottenham, but what becomes of it in the meantime?—The parts which are not connected with our drains have overflows from cesspools, and these overflows go into the various streams.

3523. Are those cesspools constructed in this bed of gravel?—No, they are in clay in that neighbourhood. The gravel ceases as the sides of the valley rise, and we come directly on the London clay.

3524. Is there a bed of clay lying above the bed of gravel?—Yes, there is a considerable elevation in the Wood Green district, and that is caused by a bed of clay of considerable thickness.

3525. Does that bed of clay extend over the gravel bed at Tottenham and across towards the Lee?—There is a little clay on the top of the gravel always, even at the thinnest part.

3526. Is there between the bed of the river Lee and this bed of gravel a bed of clay?—I think so.

3527. In constructing the reservoirs they used puddle for the puddle trenches?—Yes.

3528. Where did they get the clay from?—There was plenty of clay dug up, and they deepened the puddle trench considerably, but whether they got enough out of the puddle trench to make the whole of the puddle I do not know, but there was a bed of loomy clay on the top of the gravel as well.

3529. And that they used?—Yes; there is a considerable quantity of clay; you may see it at this time for they are making a large quantity of bricks at the side of the reservoir. We have always found a little clay before you get on to the gravel, even at the thinnest part.

3530. (*Mr. Harrison.*) You say that whatever cesspits there are in the upper part of Tottenham they are formed in impervious clay, and therefore there cannot be any communication between them and the gravel bed below?—None.

3531. Is that the case also in Tottenham proper?—No; for instance, in the Page Green district, where an inquiry was made, there the shallow wells are in the gravel; you go through 3 feet of loam and clay on the top, and come to the gravel, and the cesspools that were constructed in that district of course were also in gravel.

3532. There would be a communication in that case between the cesspool and the water in the gravel?—No doubt of it. We have sewered the whole district in order to do away with the cesspools as far as we could; but some people I think in one or two cases retained them.

3533. This bed of gravel to a greater or lesser extent is in communication with some of the cesspools which exist in the neighbourhood?—In our neighbourhood it is not so; in Edmonton there are plenty of cesspools made in it.

3534. Should you not expect that the gravel bed would rise more or less with the valley?—It does.

3535. Then if there are cesspools in Edmonton made in this gravel bed would not they be apt to contaminate the water which you pump from it in Tottenham?—I have no doubt that there is a soakage from those cesspits into the gravel.

3536. Knowing that do you think that that bed of gravel is a proper source of water supply for Edmonton?—I do not think that it is good water, but they use it exclusively in Edmonton and everywhere round the district; they prefer it very much to almost any other water, and a number of people also use it here.

3537. (*Professor Way.*) You stated that it would be difficult at Tottenham to obtain land for the application of the sewage; would it be easier, do you think, to get land in two or three places than to get it all in one spot for the same purpose; for example, could you get 40 acres in one place and 40 in another and 80 elsewhere?—In Tottenham I do not think you could get an inch of land, and I have advised the board to go over into Essex, where we could get 500 acres of land as easily as one, and pump the sewage right over to that land.

3538. (*Chairman.*) I suppose it would be a question between the cost of pumping and making a proper conduit, if you could get land cheap at a distance, and paying a much larger price for it with all the difficulties you have named where it would pass away by gravitation?—I think we could separate portions of the sewage in the upper parts of the district; it could be delivered by gravitation if we could get land in the valley of the Lee.

3539. You think there would be great difficulty because of the cost and the prejudice which exists against it?—Yes; I am certain we could not get any land here. The only feasible plan is to collect the sewage because the variations in the fall are so slight, to get all the sewage down to a convenient point to deal with it, and carry it by gravitation to a proper spot.

3540. If you were by injunction forced either into one scheme or the other, would it by any means purify the whole of the Lee if it left out the other districts?—Certainly not.

3541. Do you think that after they had dealt with you by injunction they would leave all the impurities arising from other districts with increasing populations unmeddled with, would they not take take the same course with them as with you?—Yes.

3542. Looking at it in that light would it not be very advisable indeed that some comprehensive scheme should be undertaken for the whole of the districts which require the same improvement?—I have thought it over with great care, and I am certain that unless some comprehensive scheme is devised, there will be no other satisfactory means of getting rid of the evil, for if we get rid of our sewage we are immediately troubled with the sewage coming in from Hornsey, Barnet, and Colney Hatch, so that although we may purify ourselves we are liable to have the sewage from other places sent in upon us.

3543. I suppose you might have actions brought against you for pollutions in your area which do not originate with you?—We have had that, positively the very thing has occurred. We have now an action pending against us by the river Lee trustees, and we have commenced an action against Hornsey, and Colney Hatch has an action againt Edmonton, and Edmonton has an action against us.

3544. (*Professor Way.*) If any scheme was to originate with the legislature as to the valley of the Lee, I presume it would have the support of your board?—Yes, most decidedly; but the difficulty we have to con-

tend with is in the case of parishes that are rather remote, and which do not immediately feel the pressure and the want of drainage.

3545. (*Chairman.*) Are not the East London Waterworks Company now making intercepting sewers further up the Lee?—Yes, I have given a sort of sketch of it; they propose to deal with the sewage from Ponder's End, Enfield, and Waltham Cross.

3546. The East London Water Company has given notice of their intention to apply to Parliament?—Yes.

3547. (*Mr. Harrison.*) Is there much large traffic to Tottenham upon the Lee navigation?—There is only one wharf, and I do not think there is a great deal, it is mostly to bring building materials and stone for the roads.

3548. Is the greater part of the traffic carried on by the railway?—I think, speaking of local traffic, that the road carries a great deal more than either of the two, the traffic has increased enormously on the roads for building purposes.

3549. How are the people of Tottenham chiefly employed?—A great number of them are engaged in London, and they have their residences down here.

3550. I mean the poorer people?—They are engaged in various ways, a number of them are occupied in various building operations that are going on here.

3551. Are there market gardens to any extent?—Yes, of very considerable value.

3552. Is the produce carried along the road to London?—Yes, it is taken to London in waggons.

3553. Is there much cattle traffic on the railway?—Before the cattle plague the traffic in cattle was enormous.

3554. In your judgment no very decided advantage is gained to Tottenham by the navigation being kept open?—I do not think there is much, it is of course useful for the conveyance of gravel and lime. I may mention that there is a large india-rubber manufactory, and some other factories in Tottenham, which employ a number of hands. We take the sewage from the india-rubber manufactory, and turn it into our sewers.

3555. (*Chairman.*) Is there anything further you wish to add?—Yes; I wish to draw your attention to Leighton, Leightonstone, and Walthamstowe, on the Essex side of the river Lee; no one has yet attracted your notice to those places. The schemes of drainage are of course very imperfect by gravitation, and there is no thorough system, at the same time an enormous amount of pollution must necessarily flow into the Lee, and I know of no way of disposing of it except through the channel of the Lee.

The witness withdrew.

The witness subsequently forwarded to the Commissioners the following Report:—

REPORT furnished by P. P. MARSHALL, Esq., C.E., Surveyor to the Local Board of Health of Tottenham, upon the SANITARY ARRANGEMENTS and the WATER SUPPLY to the District of Tottenham, Valley of the Lee.

The Public Health Act was adopted in Tottenham in 1852, about one-half—being the portion that formed the High Street, on the main road, running parallel with the Lee—was then sewered on the earthenware pipe system. The largest main being 18 inches diameter, the smallest 6 inches.

The 18-inch main is about two miles long, and receives numerous subsidiary sewers, diminishing from 18 inches to the size above mentioned.

The whole of the surface or storm water is supposed to be shut out from these pipes, for it is intended that they should carry off sewage only, the land or storm water being confined to its original channels, whatever they may be. The result is that two sets of drains have constantly to be attended to and kept in good order.

The advantages of this system are the comparitive cheapness with which sanitary works can be carried out in rural and thinly populated districts, and the concentration of the sewage undiluted by rain-water.

The disadvantages are that with the increase of buildings the old open drains and watercourses get interfered with, and as they are mostly on private property and each owner only liable for his own portion it is impossible to get them maintained in a proper state of efficiency, or when it is necessary to have them covered to get the work properly done. Again, they become (as buildings surround them) foul and polluted, and, in reality, a second series of foul drains. Again, every house must have two sets of drains, there is, therefore, a constant endeavour on the part of builders to make surreptitious connexions with the pipe sewers and save the expense of another drain for surface water.

When these works were laid out the question of deodorizing sewage was brought into importance from the very existence of the drains themselves. The cesspool system, so long the only one applied to the collection of sewage in Tottenham, disposed of the solid matter without creating any necessity for a deodorizing agent, while the overflow, if it polluted the ditches and streams, did not then attract much attention.

The concentration of the whole sewage of the district to one outfall raised the question of deodorization. The value of sewage as a material for manuring the land also attracted much attention, and various processes were patented for its deodorization and solidification. Mr. Higgs proposed to precipitate the solid matter suspended in the sewage at Tottenham by the application of lime, and held out sanguine prospects of a large remunerative return from the sale of the solid precipitate when dried and sold in the form of sewage guano.

Tottenham being the first important district sewered on the earthenware pipe sewer system afforded an excellent opportunity for a trial of the patent process. Mr. Higgs saw that with nothing but sewage to deal with the question of deodorization and profitable returns could be best tested, and he succeeded in inducing some influential persons to assist in erecting the necessary works. Accordingly at the outlet of the 18-inch main sewer pipe a sunk tank capable of holding a day's sewage was constructed, with a steam-engine to lift the sewage into an iron tank of nearly similar dimensions which was placed above it. The sewage was then treated with lime, the deposit was run out into shallow squares to dry, made into bricks, dried, ground, and then offered to the public as Tottenham sewage guano.

The liquid was allowed to pass off through the valves in the upper tank, and when the process was properly carried out the sewage water was clear and colourless, but the sewage matter deposited by the lime would not sell, and, although a clear and colourless liquid was drawn off, that liquid still contained all the obnoxious elements of sewage. This would probably have been of little consequence under the circumstances, as the river Lee was at hand to receive it; but the pumping and liming could not be carried on without considerable expense, and as the manure manufactured was considered valueless by those who had tried it, the whole process came to a standstill. Mr. Higgs died, and the works became the property of the local board of Tottenham.

Precipitating by lime is the only method at present adopted, and the tank is cleared out periodically by hand labour. During the winter very little lime is used, but in the summer time three or four bags a day are mixed with the sewage.

The same system has been extended to Wood Green, and the greater part of the whole district has been sewered.

The River Lee Trustees have obtained an interim injunction to stop the extension of the system, and Mr. Bazalgette, Engineer to the Metropolitan Board of Works, has been requested by Tottenham and the neighbouring districts to report upon the question of outfall.

Waterworks.

At the same time as sewerage works were commenced a system of waterworks was designed and carried out to supply the original portion of the district sewered. This has been, from time to time, much improved and extended. The principal supply is derived from wells sunk to the chalk, and some water from land springs in the bed of gravel overlaying the clay in the Lee valley; from 500,000 to 600,000 gallons a day is supplied.

Much leakage has been occasioned by the use of galvanized iron pipes for the smaller mains and house services, the water havin rapidly destroyed such pipes.

TOTTENHAM.

Mr. P. P. Marshall, C.E.

18 Dec. 1866.

The land spring water deposits a red earthy ferruginous deposit which discolours the water and chokes up many of these small mains and services. This water is also very hard.

Much still remains to be done to improve and complete the drainage of the district, but the great improvement to the general health of the district is well known. Building operations are being carried forward with great activity, and the price of land is steadily on the increase.

In the neighbouring district of Edmonton, where no sanitary works have been carried out, the reverse is the case, and although many grumble at the high rates in Tottenham, builders say that they dare not build where there is no sewerage or water supply.

Area of district.

The area of the district is given by the Ordnance Survey at 4,624 acres, but not more than one-third is built over.

Rateable value.

The rateable value is 91,000*l.* and has doubled within the last 10 years, and is now rapidly increasing.

Population.

The population at the last census was 16,000, but is now estimated at 18,000.

Houses.

The number of houses is 4,000 and they are increasing at the rate of 400 per annum.

Waterclosets.

The number of waterclosets is nearly as many as the houses, as all new houses are provided with them, and have either a supply from the board's works or from the New River Company.

Cost of fitting.

The cost of fitting up waterclosets varies much according to the length of piping required, the board have not of late made any compulsory alterations, nor is it necessary. Every cottage may now be said to have one. The board have never paid any portion of the cost of conversion, but have levied an improvement rate for the same.

Frost.

The recent frost does not appear to have seriously interfered with the use of the waterclosets. It was found necessary during the frost to supply water from hydrants in the street with a stand-pipe, and in one or two cases where the hydrant was opened or shut too suddenly, the main being under pressure, a pipe has been split. This occurred on a 12-inch and 4-inch main; the pipes, however, appeared to have been originally somewhat defective.

Heavy rains.

Heavy rains and sudden thaws flood portions of the district and inundate basements and cellars. When the water in the Lee is very high it is backed up in the main sewer, and the sewage recoils on the basements and kitchens.

Choked drains.

Choked drains frequently occur, owing to the very small pipes laid down and the large number of houses attached to them. We keep a small staff for the purpose of clearing and flushing them, but the cost of cleaning is small in comparison to the very serious inconvenience and annoyance that is caused to the ratepayers, as most of the small drains run through private property, so that gardens, walks, lanes, &c., have to be dug up and disturbed. We inspect all waterclosets regularly, and serve notices to the owners whenever they stand in need of repair.

NOTE.—The sewage works are too small for present requirements, and the board are only waiting the result of Mr. Bazalgette's report before some new arrangement is attempted.

Mr. G. Guy.

Mr. GEORGE GUY (Tottenham) examined.

3556. (*Chairman.*) What position do you hold in connexion with the Tottenham local board of health?—I am inspector of nuisances and turncock.

3557. How many years have you been inspector of nuisances?—About nine years. I have lived in the parish for 23 years.

3558. Of what do your duties consist?—I have to visit the different courts and alleys when complaints are made of nuisances and get the nuisances removed. I also go to the sewage works occasionally.

3559. Do you remember Tottenham before the works were established there?—Yes.

3560. What occupation did you follow then?—I was a sergeant of police at that time.

3561. Did you know anything at all of the condition of the ditches and streams in the vicinity of Tottenham?—I knew that the cesspools emptied into the different ditches, and that the sewage was conveyed into the river Lee in wet weather.

3562. Were those cesspools very foul?—Yes; many of them were very foul in low neighbourhoods, and the contents used to come up under the boards of the floors when they were over full.

3563. Were the ditches in a very foul state?—They were bad.

3564. Do you think that the river Lee is worse fouled now than when you first knew it, before any sewage works were established?—I could not say that, we conveyed our sewage fresh to the sewage works before it got into a putrid state.

3565. Have you anything to do with the place where the sewage is treated with lime?—I only go there occasionally.

3566. Are the men working there under your orders?—Under Mr. Marshall's orders.

3567. You are not the foreman?—No, I go to see how they are going on, and report to Mr. Marshall.

3568. What number of common privies are there in Tottenham now?—I think there are hardly any common privies, perhaps just outside the drainage district there might be one or two.

3569. Are waterclosets generally used?—In most of the houses.

3570. Have the old privies been converted into waterclosets since the board commenced its operations?—Yes.

3571. They were mostly cesspools and privies before?—Yes, formerly they were.

3572. Are there many pigstyes in the neighbourhood?—There are some.

3573. Have you removed many of them?—At times I have.

3574. Are there any large stables, or any other sources of nuisance, such as cow sheds?—Yes.

3575. Are they drained into your sewers or not?—The top water is I think.

3576. Are there any works of any kind that are liable to create nuisance?—I think not.

3577. Do the india-rubber works cause any nuisance?—We have never had any complaint about them.

3578. Do you ever inspect them?—No, but the sewage is brought into our pipe.

3579. Have you any difficulty with road scrapings?—No, the roads are scraped, and the parish authorities sell the scrapings.

3580. For what purpose?—For sand; the builders buy it for sand for building purposes on the bye roads. The high roads belong to the Metropolitan Trust I believe.

3581. What do the people do with their ashes?—We have a brickfield handy, and many of the poor people keep a horse and cart, and they collect the ashes and take them away.

3582. Does the board collect the ashes or not?—No.

3583. Do they leave the disposal of the ashes to the individuals themselves?—Yes.

3584. To do the best they can with them?—Yes.

3585. Do they find a ready sale for them to be used in the brickfield?—I think they give them away.

3586. Have you any charge of the roads as to cleansing them?—Mr. Marshall is the surveyor over the bye-roads.

3587. Have you not any control over them?—If there is any complaint I go to see what the complaint is, and report upon it to the board.

3588. Have you heard any complaints made as to the state of the roads beyond your boundary, the metropolitan roads, or any others; are they better or worse than yours?—I have not heard any complaints made of that sort.

3589. (*Mr. Harrison.*) Does the Metropolitan Board clear the refuse away from their roads in a satisfactory manner?—They scrape the roads on to the paths, and we have many complaints from the shopowners of the dirty state of the sides of the road in the highway; people have complained to the proper parties to get this removed.

3590. Have their complaints been attended to?—Not very freely.

3591. You have no power to enforce the removal of these scrapings?—I do not know, it never was tried. If they were summoned for a nuisance I do not know what it would turn to.

3592. (*Chairman.*) Is it your duty to visit occasionally the outlet works?—Yes.

3593. And if you found the local board accumulating their refuse there to a large extent, so as to become a nuisance, would you indict them?—I do not consider that there ever was a nuisance of that sort at that distance from any such thing.

3594. Do they ever accumulate a large quantity of the refuse taken from the depositing tanks?—We have a great deal at present, and the reason why we have it now is that we cannot get it away, because a new railway is formed, and it takes some time to get it carried in a cart.

3595. How many yards are there now?—I could not say.

3596. 100?—No, I should think not.

3597. Is there any smell from it?—I do not find it myself.

3598. Do any persons complain?—No person has any right to complain there, we are a long distance from any house—we have a man living on the premises.

3599. Do they complain?—Never. I have found Mr. Beardmore there, and he never complained to me.

3600. (*Professor Way.*) Is the man who lives there a man who is employed on the works?—Yes.

3601. If he complained he would be complaining against his bread and cheese, would he not?—I do not know; if it hurt him he would be foolish to stop there to affect his health.

3602. What wages do you give him?—30*s.* a week.

3603. And a house?—Yes.

3604. (*Chairman.*) What family has he?—I think that he has six children.

3605. (*Mr. Harrison.*) Have you ever visited the purification works at Hertford?—Never.

3606. (*Chairman.*) Or the purification works at Luton?—I have not.

3607. Or any other purification works?—No.

3608. You have confined your attention to your own works?—Yes.

3609. (*Professor Way.*) Do you know what farmers this material is sold to?—Mr. Ware, living just by, has bought some.

3610. When did he buy it?—At different times, and Mr. Goddard up here has a field, and he has bought some at different times.

3611. Have they to cart it away at their own expense?—Yes.

3612. How far off does Mr. Ware live?—Some of his land adjoins our works.

3613. Do you find that anybody comes from a distance to fetch it?—No.

3614. Do the same people fetch it time after time?—Yes.

3615. That is to say, those people who live close by?—Yes.

3616. What land do they put it on?—I think that it is used for mangel wurzel and cabbages.

3617. Do they mix it with manure?—They mix it with earth, I think.

3618. (*Mr. Harrison.*) We have been told that in the lower part of the town the sewage is carried away by the watercloset system, but that in the upper part there is a difficulty in that respect, and that the cesspool system is continued. How are those cesspools cleaned out?—The houses have only lately been built. The cesspools are temporary. We are in hopes that we shall soon be able to connect them and to dispose of the sewage without any cesspools.

3619. Do you know any instances in your district where these cesspools have become a nuisance?—Not at the present time.

3620. In past times have they become a nuisance?—Yes.

3621. What steps have you taken to do away with the nuisance?—If any nuisance arises the parties are ordered to clean them out, and they generally attend to the order. It should then be taken away in a cart.

3622. Have you attended to the supply of water to the cottages in Tottenham?—Yes.

3623. Does that come under your inspection?—Yes.

3624. Is the supply a constant one or an intermittent supply?—In the summer time we have not had sufficient water to keep it on all the day, and therefore it has been on for so many hours in the day; but many of these little cottages have no means of catching the water for their use, because they have no cistern.

3625. Is it under your direction as turncock that the water is supplied to them?—Yes, I turn it on in the morning till 8 o'clock at night if the water will last out. If not, it is turned off and is conveyed to another part of the parish during the summer time.

3626. How long do you allow it to remain on when you are short of water?—We keep it on as long as we can, several hours a day.

3627. Do you know how much water that will allow the different people to obtain?—No, but I should consider that there is enough for their use when I turn it about.

3628. Have you examined the different houses to see what means they have of storing water?—Yes, I know pretty well what they have. All the new houses have cisterns, and the old houses have what is called the high pressure.

3629. And the constant system?—It was intended for a constant supply.

3630. Do you examine the tanks into which the water passes?—Yes, I have done so.

3631. Do they attend to cleaning them out?—There is a red sediment in the water, which you will occasionally see at the bottom of the cistern.

3632. Are there overflow pipes from those tanks?—No, we do not wish them to have overflow pipes, because we might pump day and night if we had water, and it would be running away.

3633. There are ball-cocks?—Yes.

3634. And you think that there should not be any overflow pipes?—According to the present regulation there should not be.

3635. When the system is constant it is not a constantly flowing system, but a tap which gives out the water can be turned where the parties like to turn it?—Yes, and there is a great waste.

3636. (*Chairman.*) Is any water sold for trade purposes to the india-rubber works, or any other works?—No, the india-rubber works I think have their own supply, but we supply some for garden purposes.

3637. Is there any inspection of the leaking taps and pipes?—Yes, the board have lately engaged a young man to attend to that matter, to inspect the taps and pipes, and to report to them as to the waste.

TOTTENHAM.

Mr. G. Guy.

18 Dec. 1866.

3638. And to repair them?—We call upon the owners to repair.

3639. What kind of taps and pipes are used?—They formerly used the screw-down taps and the galvanized iron, but it is now a leaden pipe, and a common water tap with a plug.

3640. Then you have done away with the screw-down tap?—There was not the pressure from the cistern. (*The witness produced some taps and specimens of pipe.*)

(*Witness.*) I prefer the screw-down tap, the plugs are apt to leak.

3641. (*Mr. Harrison.*) Since you have had the watercloset system established in your parish, have you had some severe frosts?—Yes.

3642. What is your experience as to the working of the waterclosets in the poorhouses during frosty weather?—Many people used to leave their taps to dribble a little to prevent the water from freezing but if it was shut off, most likely the pipe would burst round the tap.

3643. Have you found that if that precaution is taken the watercloset system, even in the poorest tenements, works well?—Yes.

3644. (*Chairman.*) When you used the galvanized iron connecting pipes, what action set up, did they choke up with this red matter, or did they rust away?—They choked up; many galvanized pipes I have found entirely choked up so that they could not get any water.

3645. Why do you use brass connexions, are they preferable to the wrought-iron?—It was Mr. Marshall's order, I like the galvanized iron best; it is most convenient.

3646. (*Professor Way.*) I suppose that you have frequent opportunities of seeing the precipitating works?—Yes.

3647. And the outfall into the river?—Yes.

3648. Is the outfall far from the works?—No.

3649. How far is it?—I should think that it might be 100 yards.

3650. In what state is the river at that outfall, and just below it?—The river is bad all through.

3651. Is there any milkiness, or excessive filthiness, at the position of that outfall?—It is rather white from the lime which we use. The river altogether is very bad.

3652. The discharge is white?—Yes.

3653. Is it generally so?—During the day when we are using the lime it is rather white, in the afternoon we do not consider the water much different from other water; there is not a great deal to do in the afternoon part of the day.

3654. Do you not put in any lime in the afternoon?—Yes, there is a man there to put in what is wanted, but the water in the afternoon is clear; we consider our work to be from 9 to 3.

3655. When there is most going into the sewers?—Yes.

3656. But still at times, if not frequently, the water does run away white from the addition of the lime?—Yes, it is a little coloured.

3657. Who superintends the addition of the lime?—It is ordered to be sent down when the men want it.

3658. I mean the addition of it to the sewer?—The man who stands at the works.

3659. He is under the directions of Mr. Marshall?—Yes.

3660. And not under yours?—If anything was wanted when I was there, I should have to name it to Mr. Marshall.

3661. This lime is thrown in by hand?—Yes.

3662. How often does the man throw it in?—I cannot say.

3663. Does he do it once an hour, or once in half an hour?—Yes, less than that.

3664. (*Mr. Harrison.*) Have you had any complaints made to you, or have you made any complaints about the intercepting sewer formed by the East London Water Company?—We have not had any complaint from the East London Water Company that I know of.

3665. Have you had any complaints from anyone else?—We have had a complaint from the trustees of the river Lee.

3666. Have you at any time had occasion to complain of the condition of the intercepting sewer which the East London Water Company formed?—Yes, during the summer time it was very bad.

3667. Have people residing in the neighbourhood complained of its condition?—I cannot say that people living there have complained. I have been down there, and have myself found it very bad all along through the marshes.

3668. What steps have you taken when you have found it in that state?—There was no remedy. It was an open ditch, and the drains were emptied in from other parishes, there was no way of altering it. I understand that the East London Water Company made it for the accommodation of the neighbouring parishes.

3669. Under an Act of Parliament?—Under an Act of Parliament.

3670. (*Chairman.*) Do you know whether the people were supplied with plenty of water before the board of health came here, or not?—I used to live in Marsh Lane myself, and there was a well there which flowed, but after I had been here a few years it stopped flowing, and I had to put a pump down the bore-hole.

3671. Before the operations of the board of health the people had wells and also cesspools?—Yes.

3672. And the cesspools and the wells were sunk into the same soil?—I should consider so myself, from now and then our finding a bored well, but the surface wells would have been in the gravel.

3673. And the cesspools must have been in the gravel?—Yes.

3674. (*Professor Way.*) Have you heard many regrets at the introduction of the officers of the board of health?—I think that a good many would speak very highly of it, because I have heard them say that when they went to the common closets, they never got sweet during the day and that their clothes smelt; whereas now they can go in and out with comfort.

3675. You do not think that the inhabitants of Tottenham at large seem to have the objection which the gentleman at the end of the table seems to have to the water supply?—I cannot say. I think that they are generally satisfied.

3676. (*Chairman.*) Have you anything further to offer to the Commissioners?—No.

The witness withdrew.

Mr. Peter P. Marshall, C.E., further examined.

Mr. P. P. Marshall, C.E.

3677. (*Chairman.*) You used wrought iron pipes in the first instance for your domestic supply?—That was the system when I came here.

3678. This ochrey water appears to have acted very injuriously, both externally and internally, upon those pipes?—Yes.

3679. Have you any idea what was the length of life of a pipe under those conditions?—Many of those pipes which you see here had been in about six or seven years, and some of them longer; but after they had been in about six or seven years I should think that they were in a state in which they were incapable of conveying the water.

3680. Were they eaten and perforated as the one is which I hold in my hand?—Yes, and much worse than that.

3681. Then a great proportion of your leakage and loss of water may have come from the defective state of the supply pipes?—Yes; that I have reported to the board upon several occasions.

3682. Have you removed the whole of these services?—No; our attention has generally been called to the pipes by the people ceasing to get a supply from them, and we found that the ochrey deposit filled up the pipe entirely, so that in some places no water could come through, and when the pipe was pulled out to be opened we found holes in it, and that it had decayed away. In other instances we found the supply disappeared, and we found that the water had passed away through a hole in the pipe into the gravel, and of course the gravel itself destroys the pipes. On the outside we found that the galvanizing process had no effect at all in preserving them.

3683. The galvanizing was so much waste?—Yes.

3684. Does the gravel act equally injuriously upon the cast-iron main?—No, it does not seem to affect the cast-iron mains at all. There is the operation of scaling on the surface, but not anything like the effect which is produced upon the wrought iron. We find the deposit in the cast-iron main the same as in the wrought-iron pipe.

3685. (*Professor Way.*) Did it act upon the pipes which were galvanized or not?—Yes, I think that those which were galvanized were rather worse.

3686. (*Mr. Harrison.*) Is there free acid in this ochrey water?—We had it analysed the other day, and I do not think that there is any acid referred to in the analysis.

3687. (*Professor Way.*) Except carbonic acid which keeps the iron in solution?—Yes.

3688. (*Chairman.*) What do you now use for your house services?—Lead. We compel every person to use lead of a certain weight.

3689. Do you know what is the relative cost of a house service made with iron and of one made with lead?—I understand that the price of a lead pipe of good quality and of proper weight, such as we specify it must be, is about 1*s.* 9*d.* a yard. That is ¾-inch pipe, and I understand that the same in wrought iron would cost about 1*s.* per yard.

3690. The wrought iron would have no value when it was taken out as an old pipe, but the lead would have considerable value as old lead?—Yes; the lead when it is taken out is comparatively as good as when it was put in.

3691. Is the lead at all injuriously acted upon externally or internally by this ochrey water?—I have made some inquiries into that subject. Before we supplied the district, they supplied themselves with this ochrey water, and in the district old lead pipes have been taken up which must have been in for 50 or 60 years, and apparently they have not been damaged.

3692. Then this is a district in which wrought iron services are impractible, and you are compelled to resort to lead?—Yes.

3693. As the cheapest and the most enduring?—Yes, and the water has no action upon lead.

3694. It does not dissolve it?—No.

3695. Have you a person whose duty it is to inspect house services, and to see whether the taps are left on or are in a leaking condition?—Yes, we have a man appointed for the purpose, whose duty it is to go from house to house and ascertain the state of the water supply.

3696. Have you found any diminution in the volume of water taken from you in consequence of those inspections and those operations generally?—I cannot say that it has made any perceptible difference, owing naturally to the fact that there is great difficulty in proceeding against the people.

3697. If you are pumping in the volume which you name do not you feel certain that a great proportion of that water is going to waste?—Yes, I feel quite satisfied of it.

3698. And does not every gallon wasted represent so much fuel wasted?—Yes.

3699. And working expenses wasted?—Yes.

3700. Do you not think that it would be very advisable, if practicable, to diminish that waste by proper supervision?—Yes. I attribute a great quantity of the waste to the existence of these galvanized mains, which exist to a great extent. I think that the annual saving which would result from taking up the whole of them and having proper mains put down in their place would more than compensate the cost.

3701. (*Mr. Harrison.*) Does it not affect the supply to the people as well as the expense to the board?—It does, and in places where leakage has taken place, that is the way that our attention has been brought to it. We find on examination that the pipe does not deliver the proper quantity of water, and that it is incapable of doing so.

3702. It more or less affects the people where these wrought-iron pipes are laid?—Yes; and the whole of this district has been more or less laid on with them.

3703. Could you give us some exact information as to the volume of water taken by the inhabitants?—Yes; I am preparing to give you a statement of the quantity delivered. We can only ascertain it by calculating the quantity delivered and the number of people whom we supply.

3704. In your case you cannot rely upon any calculation of the sort, because your leakage in many places is much more than your delivery?—Yes; but from the returns which I have had from many other towns they seem to have the same result; they supply as much water as we do per head, and in some places more.

3705. (*Chairman.*) Are you supplying any water for trade purposes?—Hardly any.

3706. Do you supply any of your customers by meter?—None at all. We found that the ochrey deposit prevented the meters which were in use from revolving and measuring correctly.

3707. (*Mr. Harrison.*) So that this ochrey water which you take the trouble of pumping appears to be a very doubtful source of supply; in the first instance, in consequence of the pollution in Edmonton, as well as in Tottenham itself, and after you have taken the trouble to pump it, it eats away your pipes, and it seems that after your putting in meters to measure what you deliver in some cases it partially stops the supply to the people, and in some cases stops it altogether?—Yes; you are talking of the gravel water.

3708. Yes, it is the gravel water which does the mischief?—Yes.

3709. And if the gravel water were taken by itself it would do more mischief than it does now?—Yes, and in the first instance we had scarcely anything but the gravel water.

The witness withdrew.

EDWARD THOMAS BUSK, Esq. (Edmonton), examined.

E. T. Busk, Esq.

3710. (*Chairman.*) Where do you reside?—I live in the parish of Edmonton, near Winchmore Hill.

3711. Are you chairman of the local board of health of Edmonton?—Yes, and I have been so since its formation.

3712. And are you a local magistrate?—I am.

3713. And also a barrister-at-law?—I am.

3714. How long has the Local Government Act been in force in Edmonton?—Since 1850.

3715. Have you carried out works of sewerage and water supply in Edmonton?—Partially, where required.

3716. Have you had any difficulties with your sewage recently, or at any time?—Not from our own water, only from the Colney Hatch Asylum.

3717. Do the Colney Hatch people drain or sewer into your district?—Yes; I should also explain that I am one of the visiting justices of the asylum, and we have now taken proceedings against that body, so that in my capacity as chairman of the board of health I have absolutely moved for an injunction against myself as one of the visiting justices at Colney Hatch, therefore I shall speak with delicacy with regard to

TOTTENHAM.

E. T. Bush, Esq.

18 Dec. 1866.

anything which I may have to say with reference to that matter. At the same time I am bound to say that there is a very great nuisance arising from that source, or we should not have gone to law to attempt to prevent it.

3718. What population is there at the Colney Hatch Asylum?—About 2,400; there are about 2,000 patients, and about 400 attendants.

3719. Do they keep any stock of any sort, such as pigs or cows?—There had been about 30 cows at the farmstead until the outbreak a year ago of the cattle plague, and then the number was reduced to eight, and they are now increasing them again.

3720. Do they keep pigs?—They keep about 200 pigs. The pigs eat the offal; the lunatics leave a vast amount of food and it is turned in fact into pork.

3721. What area of ground have you for the asylum?—Between 70 and 80 acres.

3722. Is there any possibility of getting more ground adjoining the estate?—That was partially recommended, I think, by Mr. Lawson. We applied to you to attend to it, but your engagements would not allow it, and you recommended Mr. Lawson, and as a dernier resort he recommended the use of further land, but we were not sufficiently satisfied with the use which we already made of the irrigation there, to induce us, except in the utmost necessity, to adopt the farming system.

3723. Had you to multiply irrigation upon any of the land at your disposal?—Yes, considerably.

3724. In what way did you try the irrigation?—By hydrants; the sewage was all pumped up in the first instance by steam power, and it flowed over the land by hydrants, but the quantity which was used was not sufficient to absorb anything like the whole amount of sewage which comes from that spot.

3725. What crops did you irrigate?—We irrigated principally the grass land, and it was only available for certain portions of the year when the crop was in an early stage, it would not do to put it on in a great measure when the crop was advanced.

3726. Do you grow Italian rye grass?—Yes.

3727. Are you aware that with Italian rye grass you can go on dosing the land, and that it is of advantage to irrigate the roots three or four days before you begin to cut it?—Yes, we use as much sewage as we can upon the Italian rye grass, but the crops which are grown can only take it at certain seasons of the year.

3728. How many acres have you under Italian rye grass?—Not above three or four acres.

3729. Do you still feed your cattle from it?—Yes, with the horses, and partially with the cows.

3730. You turn it into milk?—Yes; it is cut from three to five times a year, according to the season.

3731. Does not that experiment satisfy you that it would be an advantage to have a larger area of land from which to get Italian rye grass?—There is great difficulty in applying the sewage. There are only eight hours in the day when it is pumped on. The working hours of a man are but eight hours, and only during that time is he engaged in applying it to the crop, and it does not take more than half while it is being applied, and that is only one third of the whole 24 hours, so that that is only one third of the half which is used.

3732. Then the fact is that you have a material which is commercially valuable when properly applied in agriculture, but although you have utilized one third of the half, namely, one sixth, you do not feel justified in attempting to utilize the whole?—No, because the expense is very great.

3733. Do you think that the expense is greater than the result?—Yes, we feel that to be the case, but it is difficult to measure it; we have a great deal of labour.

3734. (*Professor Way.*) Is the sewage all pumped by hand power?—It is all pumped by steam power.

3735. (*Chairman.*) You have placed your patients at Colney Hatch, and I assume that the asylum is a county asylum?—It is.

3736. Is it for a single county?—It is for a part of the county, one establishment is at Hanwell and the other at Colney Hatch.

3737. And all the expenses are met by a county rate?—By a lunatic rate, and collected at the same time as the county rate.

3738. Do you not think that it will become the duty of the magistrates to utilize this sewage, if it disinfects it at the same time, although it may not be a profitable operation, and you may be compelled to face an extra expense?—That is why we have gone to the Court of Chancery, to see whether we cannot prevent their putting any of their sewage into our brook.

3739. You are now speaking as chairman of the Edmonton local board?—Yes.

3740. And you say as chairman of the local board that your local board have gone to the Court of Chancery to restrain the magistrates from passing the sewage from the asylum down into your brook?—Exactly so.

3741. They may do what they like with it, if they will not put it there?—Certainly. We took a similar proceeding against another neighbour, our northern neighbour, Enfield. Some few years ago we obtained an injunction against them to prevent their passing any of their sewage into the Edmonton brook, and in consequence, they had to make a lateral pipe drain from west to east into the intercepting brook belonging to the East London Waterworks Company, which you have already heard about.

3742. Are there many cesspits or cesspools in Edmonton?—The system is by cesspools. We have to do only with the overflow from the cesspools.

3743. Then you are satisfied as a local board to accept the arrangement of cesspools and to arrange your drainage for taking away the surplus water, or overflow from those cesspools?—Yes, having the constant surveillance of all the cesspools, to see that they are properly emptied at regular times, and that no evil arises from them. That is our system, and I will go to results. We find that our health is nearly equal, if not quite equal, to that of our neighbours, both north and south, namely, on the north, Enfield, and on the south, Tottenham. The death rate also, I believe, is rather inferior to that of either of those parishes.

3744. Did you hear the remarks with regard to the death rate of Tottenham, that it is unduly increased by numbers of children sent in to be nursed from London?—I heard that observation made by the chairman of the Tottenham board, and I must confess that I was not prepared to hear it, because though there are several cases of that sort, and although as chairman of the board of guardians, I hear a good deal of these illegitimate children, I should not have thought that there had been a sufficient influx of that class to affect the death rate materially. I think that I can say positively that that cause does not exist in our parish, which is only two or three miles from Tottenham.

3745. From your knowledge as chairman of the board of guardians you do not think that that fact is of sufficient importance to influence very materially the death rate at Tottenham?—Certainly not in our parish. I would rather confine myself to that than to speak of Tottenham. The chairman of the Tottenham board may be right, but I was astonished to hear it.

3746. What mode of water supply have you in Edmonton?—Two sources, one from the New River, there being a main from the river at the upper part of the parish at Bush Hill, which supplies what we call the lower, but which is really the upper part of the parish of Edmonton, and also a system of separate wells.

3747. Are the wells deep wells?—They are principally, or I should say entirely from the gravel. There are a few artesian wells which are sunk very low for a constant flow of water, but the major part of the wells are from a gravelly subsoil.

3748. Do they produce this red ochrey water which we have heard of?—No, I am not aware in my own experience that it exists materially in the wells, but I know that it does exist on the surface of the soil, and

injuriously, for agricultural purposes. It has a curious tendency to stop up the earthen pipes which we use in agriculture for land draining. I have several places which I have drained, and every four or five years the pipe gets stopped up with this glutinous sort of ochrey water, which as it flows down seems perfectly pure and clear, but it contains a colouring matter which gives the water a ferruginous appearance. Forty years ago my father had this water analysed, thinking that there might be a chalybeate in it. The analysis was then conducted by Godfrey and Cook, of Southampton Row, but they could find no iron in the water. This was water taken from comparatively the surface, it being one or two feet deep. I cannot say from what that bright colouring matter was brought.

3749. (*Professor Way.*) The water frequently comes out colourless, and forms this deposit, and then runs away colourless?—Yes.

3750. You would find the iron in the first instance, but not in the last?—We had a spring which we thought chalybeate.

3751. The water deposits the iron as it flows?—It may be so; I am not a chemist, and I merely tell you the practical result of what I have noticed. I should also state that when the board was first established, we thought that the flushing system would not suit a parish of our description. We have a surface of very nearly 8,000 acres to deal with, and we thought that any thorough system of drainage was not applicable to a parish, the population of which was scattered over so large a surface as ours was; it would have been ruinous to have attempted such a system. This proceeding has been found to answer remarkably well, and it suits the pocket still better, for our rates have never exceeded 10*d.* to 1*s.* in the pound. In Tottenham they are 3*s.* 4*d.* in the pound. As a Justice I have to sign all the summonses, and in Tottenham the proportion is very much greater than in Edmonton. We don't oppose a thorough system of drainage where you have your houses sufficiently concentrated, but we are spread over a large surface, and it would not do in our parish to put a large main drain throughout the whole of it.

3752. (*Chairman.*) At the Colney Hatch asylum was there at any time a swallow hole or an absorbing well to drain into?—Yes.

3753. Did the magistrates consult Mr. Bailey Denton as to their sewerage?—No, it was Mr. Blencairn.

3754. Have you thought over the question of one body having one jurisdiction over the entire valley of the Lee, so as to enable local authorities to get rid of nuisances without all this private litigation?—I have thought it over many times, and I think that there is no other way of getting out of the difficulty, because there is no legal power at present to compel the parishes who are affected by the nuisance to unite, unless they voluntarily do it, but I do not think that there is any chance of their doing so. I am speaking of the main drain through the Lee valley.

3755. I suppose that you know sufficient of human nature to know that a permissive power, letting persons stay out or come in, might defeat the object in view?—That is my opinion.

3756. And that, however beneficial the scheme, it is hardly likely that all parties will acquiesce in it?—I certainly do not see much prospect of it.

3757. Are you sufficiently near the river Lee to be liable to be charged with polluting it?—Yes; the old river Lee is our eastern boundary, and the navigation river, which is taken out of it, runs through the eastern part of the parish. I have a considerable portion of land immediately on the banks of the Lee; but, as I have already stated, our own sewer and that of the Colney Hatch asylum do not at all affect that portion of the river Lee, because they go into the Catchwater Dyke, which was dug under an Act of Parliament passed, I think, in 1853—the East London Waterworks Act. It was constructed to catch all the sewage which was emptying itself from the western side of the Lee, and to carry it down into this parish of Tottenham, and the outfall of that Catchwater Dyke happens to be in the lower part of the parish of Tottenham.

3758. (*Professor Way.*) Do not the people of Tottenham complain of its passing through the parish?—It begins in Ponder's End, which is in Enfield parish; it comes through the whole of Edmonton parish, immediately parallel and contiguous to the Great Eastern Railway, and diverges from it at the Angel Road Station. There it takes an eastern direction, and then again flows to the south, and empties itself into the river near the mills at Tottenham. But I have never been aware of any nuisance which existed there. At the outfall there may be a nuisance, but where it flows I have never been aware of any nuisance, neither have I heard the railway authorities or the gentleman who has been for many years at the station, and lives on the bank of the Catchwater Dyke, say that there has been any disagreeable smell from it.

3759. Is that in Edmonton?—That is in Edmonton parish.

3760. I suppose that it gets worse as it flows, and is worse when it comes down here?—Yes, partially so. My own opinion is, that if the parish of Tottenham. instead of draining into the river Lee, had gone into this Catchwater Dyke, the river Lee Commissioners would not have had a leg to stand upon; but they carry their sewage direct into the river Lee, and not into the intercepting cut.

3761. (*Mr. Harrison.*) With regard to the law suit which is pending, do the Tottenham board propose to carry the sewage by a new outlet into the river Lee, or do they propose to pass it through their purifying system, and to leave it as it was to be carried to the present outfall, so that there will not be a new outfall into the river Lee?—I say that if they had taken it into the Catchwater Dyke I do not think that the river Lee commissioners could have interfered with them; that is a mere matter of opinion. It was a statutable cut made on purpose to catch the western drainage.

3762. (*Professor Way.*) That cut could not be objected to in law?—I think not. The only difficulty is that the word "now" is introduced into that statute and there is thought to be a difficulty from that word "now." It is the Act of the East London Waterworks Company, and they have never made use of it. The word "now" refers to 1853. Some legal mind seems to apprehend that difficulty.

3763. Are you not talking of a dry matter of law?—Yes.

3764. The evil would be the same whether the sewage went into the one cut or the other?—Yes, the evil would exist without doubt, and an evil it is.

3765. I suppose that we are all interested in getting rid of the fact, and not supporting these evils?—Yes, I do not see how the evil is to be got rid of except by continuing this intercepting sewer. Ware is now the greatest nuisance to the river because the whole of the sewage of the town of Ware, which has a considerable population, runs unmixed and undiluted into the river Lee.

3766. (*Chairman.*) Then if the river Lee trustees do not choose to make fish of one and flesh of the other they must forthwith commence action against the town of Ware?—Yes. The sewage of Hertford is already purified by the New River Company, but the New River Company take their source of water supply above the place where they have brought it down. After that purification they allow it to run along an open conduit for a mile or a mile and a half before it runs into the river Lee. It goes through a preparation of lime, and the works are very elaborate and very expensive; it takes the smell away, but they have a great difficulty in getting rid of their deposit as they have at Tottenham.

3767. It is not quite so valuable as guano?—Certainly not. The late chairman of the New River Company took a lot of it to his farm, which is a few miles distant, but he did not come another year for it. I am not a chemist, but in my opinion when the sewage is disinfected by lime the fertilizing quality of the sewage is very much taken away, it is deterio-

TOTTENHAM.

E. T. Busk, Esq.

18 Dec. 1866.

rated. I will not say that it is wholly absorbed or destroyed, but it is very much deteriorated.

3768. (*Professor Way.*) It is not the lime which takes the value away, but the value goes away in the water?—That I will not undertake to say, but it is taken away from the deposit.

3769. You say that you have thought of the advisability of having some measure for the whole of this valley; would Mr. Marshall's scheme be such a measure; would not it be a partial dealing with works without accomplishing a benefit to the whole valley?—It certainly would. You leave Ware out and Hertford and Bishop Stortford. Bishop Stortford is on the river Stort, which empties itself into the river Lee at Rye House.

3770. If it was subsequently found necessary to deal with the upper parts of the valley, might it not be very difficult to make them fit on to this scheme?—I do not know that it would be. I think that the only way in which we can get rid of our sewage will be by taking it to the low level sewer of the Metropolitan Board of Works. I should also state that we cannot get any water supply from the river Lee, because the New River Company and the East London Waterworks Company have by an agreement taken the whole surplus water, which they want for supplying London, and therefore they would not grant it to any interlying parish for water supply.

3771. (*Mr. Harrison.*) Is not their power under an Act of Parliament?—Yes, there is an agreement. The New River Company supply themselves higher up above Ware, and the East London Waterworks Company supply themselves from Tottenham by Tottenham Mills.

3772. How are you supplied with water at Colney Hatch?—By a well which is sunk down about 160 feet into the chalk.

3773. How do you pay the New River Company for the supply which you take at Edmonton?—That is paid for by the different householders who take it according to the size of the house.

3774. Is it the New River Company's system of supply?—Yes; we have nothing to do with it; it is between the customer and the New River Company.

3775. Then the charge for water supply is not one of the rates included by you in the shilling?—Certainly not.

3776. What steps do you take at Edmonton for removing the matter from the cesspits?—Notice is given to the occupier or to the owner where there are poor cottages. The only difficulty which we have found in having them emptied when full is from the want of conveyance, but we have now a conveyance for the purpose, and have a regular system to have them emptied.

3777. How is the population of Edmonton as to density, as compared with Tottenham?—I should not say that it is quite so overcrowded, but the gross population, I think, is now 10,000 as against 14,000 in Tottenham by the last census.

3778. Is the population of Edmonton scattered over a much larger area than the population of Tottenham?—It certainly is with the exception of Wood Green, which is in the parish of Tottenham. That sewage was intended to be brought into the general system, which was explained by the surveyor, but unfortunately not being allowed to do that it does not take the natural course but flows back upon our parish.

3779. In comparing the death rate of Edmonton with that of Tottenham, the relative density of the population is an element which should be taken into account. If your population is scattered over a large area as compared with theirs, you would expect that your district would be more healthy than theirs?—Yes, but the only two cases which we have had of cholera in Edmonton we have found in the outlying and the highest district. However, that is a freak of the disease which we cannot account for. If it had extended very greatly, no doubt the lower parts would have suffered as much or more.

3780. Do you know at all what quantity of water the New River Company supply per head to Edmonton?—No, but I think that they have a regular supply. I have never heard any complaint of their supply where they have provided for it.

3781. You have mentioned what you consider to be the rate in Tottenham, can you give the details of that rate?—No. With respect to health I hear the accounts of illness every week, and the health rate is certainly quite equal, if not superior, in Edmonton to that of the adjoining parishes of Enfield and Tottenham.

3782. Are the people who reside in Edmonton of a superior class, taken as a whole, to those residing in Tottenham?—The labouring classes in Edmonton do not earn so much as in Tottenham, because there is a greater element of agricultural labour and less manufacturing. We have one manufacture, but it does not absorb any large number of people, they are principally agricultural labourers; some few go down as far as the Enfield Lock Works, but there are very few of them.

3783. Is there a large population of persons in the more comfortable classes of life in Edmonton?—I should say not; there is a larger proportion of lower rented houses in Edmonton than there is in Tottenham, that is to say of mere cottages.

3784. (*Professor Way.*) I suppose that in both places there are a great many persons who have business in London and who come to Edmonton and Tottenham to reside?—Yes.

3785. Are there more resident gentry in them than there would be in a purely agricultural district?—Yes, a sort of gentry. I am not aware of any real artisans in Edmonton who go backwards and forwards to London, but in Tottenham I believe there are a considerable number of that class. I should also mention (because it seems important that you should know it as a deduction was made from the statement of having the cesspools in the gravel) that our cesspools are not in gravel; the subsoil is gravel, but not till you get a considerable depth down. In all the valley there is alluvial soil for a considerable distance; then we come on to a very fine stratum of loam, varying from 10 to 15 feet deep, and then we come on to a bed of gravel, but our cesspools are not 14 or 15 feet deep, but only 3 or 4, and therefore they are not let into the stratum from which the water is taken. I will not undertake to say that it is perfectly impervious, but still it is not taken from the same stratum.

3786. (*Mr. Harrison.*) You think that the statement that the cesspools go with the gravel is a mistake?—I think so. At the asylum we have no gravel at all. We go down from the upper clay to the blue London clay, 80 feet, and we never touch the gravel, and that is only three miles west of this.

3787. Should you have any difficulty in obtaining land at Colney Hatch?—Yes, it seems to be nearly impossible. I do not think that we could get any there. There is one farm, but it belongs to Mr. Cline's trustees, and I understand that the tenant who is willing to let is not allowed to do so by the conditions of his lease; that is what I have heard, but there is no doubt difficulty in getting land.

3788. (*Chairman.*) Have you sewers for your water supply?—We have sewers wherever it is necessary.

3789. But there are cesspools?—Yes.

3790. (*Mr. Harrison.*) You say that you have a regular supply of water from the New River Company?—Yes.

3791. What becomes of it after it leaves the houses?—Some of it goes into the drains. Where required there is drainage from the cesspools, and from the house drainage, and that is carried into the intercepting sewer of the East London Waterworks Company.

3792. But for carrying away the water supply, after it has been used in the houses, have you a system of sewerage?—Yes, no doubt. We have no open ditches, it all goes into the intercepting sewer.

3793. (*Chairman.*) We shall have your surveyor before us?—Yes.

3794. Is there anything else which you wish to state?—No.

The witness withdrew.

Mr. ROBERT GOSSET (Edmonton) examined.

3795. (*Chairman.*) You are surveyor to the local board of Edmonton?—I am.

3796. How long have you been their surveyor?—Ever since the commencement, in August 1850.

3797. What do your duties consist of?—I act generally as surveyor of highways and of sewers, and also as inspector of nuisances.

3798. What occupation did you follow before accepting the appointment of surveyor to this board?—That of an auctioneer and surveyor.

3799. You were not educated as an engineer?—No.

3800. Is there any system of sewers in Edmonton?—They have carried out various short sewers since the board came into operation, they are divided into several contracts.

3801. Did you design those sewers and write the specification?—Yes, I had the doing of it all.

3802. How much money have you spent?—On the average I suppose about 400*l.* a year for that particular description of work.

3803. Have you borrowed any money to carry out your sewage works?—None whatever.

3804. Then you have no debt?—None whatever.

3805. What length of highways have you under your charge?—About 33 miles of roads; of course that does not include footpaths.

3806. Do you repair them by men employed under yourself, or by contract?—By men employed under myself.

3807. How many men do the board employ?—On the average ten.

3808. Do you know what weight of stone or gravel you use per year?—In the shape of material about 5,000 yards a year.

3809. Would that be about 4,000 or 5,000 tons?—Yes.

3810. In scraping your roads, can you sell the road-scrapings?—I could do so, but the board decline entering upon that.

3811. What becomes of them?—They are taken by any person who thinks fit to take them away.

3812. The board give them?—Yes.

3813. How many waterclosets do you think that you have in your parish?—Very few, perhaps not more than 200.

3814. What is your population?—About 10,000.

3815. What is the area of your parish?—About 8,000 acres.

3816. If you have not waterclosets, what convenience have you for the population?—Cesspits and privies—privy cesspits.

3817. And ash middens?—Yes.

3818. Do the board empty those cesspits and ash middens, or do the people themselves empty them?—The people themselves empty them.

3819. Then whatever cost they may incur in emptying their ashpits and cesspits it will not come into any general account, to be measured against the rates of the district?—Not at all.

3820. Have you any water supply?—None.

3821. How is the district supplied with water?—By wells.

3822. Then I assume that the parties have to dig their own well, and supply their own pump?—They do.

3823. And any cost of that kind comes out of the pockets of the owners of property?—It does.

3824. And that would not appear in the rates?—No.

3825. So that if the Tottenham people have sewers and drains, and have a water supply, and pay for their conveniences by rate, it would apparently be so much against the Tottenham people, and in favour of the Edmonton people?—No question of it.

3826. But if you could put down the cost of the wells and of the pumps, and of forming these privies, and of emptying them, you would come to something like the truth?—You might do so. In our parish people generally appear to approve of having a control over their own water.

3827. They approve of having their own well and their own cesspool?—Yes.

3828. Do you know what is the cost of making a cesspool and a privy?—It of course depends upon the nature of it; generally a cesspool would cost 70*s.* or 80*s.* I should imagine.

3829. What will it cost each year to empty them?—Perhaps 10*s.*

3830. (*Mr. Harrison.*) How many times are they emptied in the course of the year?—Some of them require emptying every year, but some will go two years, and more than that.

3831. What would be the rateable value of the poor tenements?—The rateable value generally of the poor tenements I should suppose would be 6*l.* or 7*l.*

3832. How much would that be in the pound for the cleansing of the cesspit?—It would amount to something like 1*s.* 3*d.* or 1*s.* 6*d.*

3833. That is to be put in addition to the ordinary rates of Edmonton, if you wish to compare the expense to which Edmonton goes with that of Tottenham?—It would appear somewhat fair to do so, though you must not take the statement in its extreme sense.

3834. (*Professor Way.*) In the one case the town pays for the whole, and in the other case each of the individuals pays for himself; the sum may be the same or more in Edmonton than in Tottenham, and yet you know nothing about it?—I quite understand the proposition.

3835. In one instance the expense becomes public and is known, and in the other it is not known?—Just so.

3836. (*Chairman.*) I suppose the fact will be that in the case of a cesspit, if the subsoil absorbs the material, it will take a longer time before it will fill?—No doubt of it.

3837. If it runs down into the gravel or the subsoil it takes a longer time to fill, and requires less emptying?—Yes.

3838. But if the well is pumping the water out of that cesspit it is relieving the cesspit at the cost of the well?—Yes.

3839. (*Mr. Harrison.*) What is the longest time for which you know of any cesspit remaining without being emptied?—I do not remember any to have remained longer than perhaps from two to three years; I am speaking from memory.

3840. And when it is emptied is there a large quantity of deposit taken from it?—Generally about an ordinary waggon load.

3841. After two or three years' collection?—Yes.

3842. Is there any liquid along with that deposit?—There is generally liquid.

3843. (*Chairman.*) As to the smell of that stuff when it is emptied, what kind of smell is it?—Very unpleasant.

3844. (*Mr. Harrison.*) Do you suppose that that waggon load represents the quantity of solid and liquid matter which has been turned into that cesspit during the two or three years?—I think so, with a very trifling absorption; I think that that would represent it generally speaking.

3845. You think that if you were to put a waggon under a single privy for two or three years, that waggon would hold the whole liquid and solid excrements of the people who use that privy?—It appears so to me as far as I have observed. I have not observed that there is any very deep saturation of the ground round about it after being emptied.

3846. (*Professor Way.*) Have not most or many of these cesspools at Edmonton overflows?—Most of them have overflows; all near our covered sewers have overflows.

3847. Then it is only a case of holding the solid?—Yes.

3848. It gets very solid?—Yes.

3849. (*Chairman.*) Is there anything which you

TOTTENHAM,
Mr. R. Gosset.
18 Dec. 1866.

wish to add?—I may say, with reference to the water, that we had a complaint some short time since of a well which we considered the worst, and Dr. Letheby's analysis showed that it was not bad.

3850. (*Mr. Harrison.*) What was your population in 1851?—There was not a great deal of difference, I think that it was about 9,000 or something over 9,000.

3851. Have you any establishment in Edmonton in connexion with the London unions for the purpose of rearing children?—There is an establishment connected with the Strand union.

3852. How many children are brought up at that establishment?—I think between 200 and 300.

3853. Is that the only one?—Yes, and none of their drainage gets into the brook; they have a tight tank which they pump.

3854. Do they use it successfully?—Yes.

The witness withdrew.

Mr. William Ironside (Enfield) examined.

Mr. W. Ironside.

3855. (*Chairman.*) What are you?—I am surveyor to the Enfield local board of health.

3856. How long have you been their surveyor?—11 years.

3857. Have they carried out any sewerage in Enfield?—Yes.

3858. Who designed and laid out the sewerage?—Mr. James Pilbrow.

3859. Do you know what the main sewers have cost?—When they were first put in they cost about 7,000*l.*

3860. What is the population of Enfield?—At the last census but one it was about 9,000, and at the last census it was not much increased, it was between 12,000 and 13,000.

3861. Has it increased since 1861?—Not a great deal, it increased very little between the two censuses; how much it has increased since I cannot say, but I think not a great deal.

3862. Is the Enfield Small Arms Factory in the district?—It is partly in Enfield.

3863. Does it come under your local board?—No, that is quite under Government.

3864. Have they any drainage?—No, so far as I know, I do not think they have; they scarcely allow us to go in to look at it.

3865. Have you any water supply in Enfield?—Yes.

3866. Where is the water obtained from?—Chiefly from an artesian well at Ponder's End.

3867. Was it designed by Mr. Pilbrow?—Yes.

3868. And are there an engine and pumps?—Yes.

3869. Do you get as much water as you require, or more than you require?—We did not get so much as we required in dry weather four or five years ago, and we have taken some land springs about 16 feet deep.

3870. Does that give you as much as you want?—At the present time we are laying out nearly 6,000*l.* additional for water supply.

3871. What kind of water is the water from the land springs?—It is a great deal harder than the water from our artesian bore.

3872. Is it ochrey?—I have never perceived it to be the same as was shown here to-day by persons from Tottenham. We have galvanized iron pipes, which have been on for 10 or 11 years, and many of them are as clean and as bright as when they were put on; at the same time a few of them in places are affected, and I can scarcely understand it; it appears to me to be from the earth where they are laid, but there are very few affected.

3873. How many houses have you drained?—I am not prepared to say.

3874. How many waterclosets are there?—I should think about as many as we have houses drained.

3875. Are there any privies?—In the parish there are, but not in the town of Enfield and the town of Ponder's End; the parish is a very wide parish, it extends almost in a straight line of eight miles.

3876. The town of Enfield proper has been sewered and drained?—Yes.

3877. And the houses have waterclosets?—Yes.

3878. And you have done away with the cesspools there?—Yes, and also in the Ponder's End district.

3879. Have they there a water supply from the waterworks?—All who choose to have it, nearly all of them have it now. In the first instance it was objected to, it not being forced, but as a landlord loses a tenant he finds that he cannot get anyone to take his house until the water is laid on.

3880. Do you think that the tenants themselves prefer a watercloset to a cesspit?—I have not the least doubt of it.

3881. What becomes of the refuse when it passes from your sewers?—Our sewers first empty themselves into some settling tanks, there are six of them, there are two sets, three in a set, and the material runs out of one into the other, and after it has run through those beds it passes through two other tanks which are 20 feet by 8 feet, by 4 feet 6, but we fill them about four feet; it passes through a filtering bed of stone and ballast, which is taken out and washed about five times a year.

3882. Do you use lime to mix with the sewage?—No.

3883. What weight of material do you get out of your settling tanks?—I should think that we take out 150 tons every three months, all the year round; that material is taken out in a wet state.

3884. Do you dry it?—No, we take it out by manual labour, and fill it into waggons, and we take out about 25 waggon loads from every tank, that is 25 waggon loads about every five or six weeks. The board will not allow it to be put on to grass land, but the parties taking it are compelled to put it on to ploughed land, and it must be put on the same day or the day after.

3885. Do you give it to them?—Yes, the board give them something to take it away.

3886. In your opinion is it beneficial?—Yes, in a small way, but not to the extent which I supposed is would be. I was never more deceived in my life.

3887. What is the total cost to the Enfield board of so disposing of that sewage?—About 70*l.* a year in round numbers, 80*l.* at any rate overpays it. The washing of the ballast is the greatest expense.

3888. What becomes of the fluid which passes away from the tanks?—It passes down a stone ware glazed pipe into the sewer which was cut by the East London Waterworks Company for the drainage of Enfield.

3889. Does it go into the Lee below where they take their water?—Yes; that is what they call the sewage ditch.

3890. What becomes of the ashes from the dwelling houses?—Several people get a living by having an old pony and cart, and they go round and collect them, and take them to the different brick fields. I believe that the people who take away the ashes generally give the lower orders a penny or two for taking away their ashes. Where there are gardens they are no doubt put on the gardens; there is no difficulty in getting rid of them.

3891. Are your main sewers ventilated?—There are a few ventilating shafts in them, but not many; we have never found anything disagreeable in them.

3892. What is the diameter of your largest sewer?—We have one brick sewer 3 feet 2 by 2 feet 2 that is at Ponder's End; it takes in the storm water from a part of that district as well; it is only about 600 feet long I think. The next largest is an 18-inch brick sewer, and there are 15-inch glazed pipe sewers, and 12-inch and 9-inch pipes; a great part of the parish is drained by 12-inch and 9-inch pipes.

3893. What are your junctions for draining the

houses, are they 6 inches or 4 inches?—We have nothing less than 6 inches.

3894. Have you any trouble with those pipes choking?—No.

3895. Or bursting?—No; we have only, I think, had two bursts in the house drainage.

3896. Have you had any chokings?—Now and then we have closets choked in the traps, but not in the pipes.

3897. Do you consider your system of sewerage perfect?—Yes, very perfect indeed.

3898. When you open down to put in a junction do you find the drains clean or otherwise?—They have generally been as clean as on the day when they were put in, and in the foulest instance with a 12-inch pipe there was not more than 3 inches of water in it.

3899. It may have got out of the line?—Yes. There is a little settlement in one place, but it gets no worse, and goes out as clean as possible.

3900. What do you do with the road scrapings?—We are very glad to give them if anyone will take them, and if not, we have horses and carts and shoot them where we can, and we sometimes sell them to the bricklayers.

3901. For sand?—Yes.

3902. Do you know what has been the total cost of your sewerage works in their entirety, and of your waterworks in their entirety; I refer to the total cost of the main sewers, not including the house drains. What is your debt for main sewers?—The debt is now about 6,000*l.* exclusive of the new additional works, or something like 13,000*l.* including the main sewers and the waterworks.

3903. Do your people grumble much at the oppression which they are under from having these works?—They did a little at first, but I do not hear much of it now.

3904. In your opinion do they think that they are any better or worse off for those works?—I am quite convinced that they are a great deal better off, and I am certain that in the case of those who have not got the water, if it is within where they can have it, the landlords cannot let their houses without it. In several places where they have been beyond the hundred feet, they have come to the board to ask to have liberty to put it on.

3905. Has your board had any difficulty lately with regard to the outlet of the sewers; have you had any threat of actions?—Some few years ago the Edmonton parish got an injunction against us for running the sewage through their parish.

3906. How was it settled?—I believe that we were obliged to alter it; it was a case which I always considered was very badly managed. I thought that we ought to have beaten them.

3907. You think that your lawyer was not quite equal to the other lawyer?—I do not consider that he was up to his work.

3908. (*Professor Way.*) What is the nature of the water which comes away after the deposit of the sewage?—After it has run through the filtering beds it looks clear enough; it has rather a strong smell at times.

3909. Does it run into the intercepting ditch?—Yes.

3910. Then you do not plead guilty to running the whole of your sewage into this intercepting ditch?—Certainly not. We take away 250 waggon-loads a year out of it.

3911. You have given us 150 tons in three months?—Yes.

3912. That would be 600 tons in the year?—Yes. We take from 50 to 60 waggon-loads out perhaps every 10 weeks.

3913. You said that you were surprised at the little efficacy which that stuff had upon the land?—I was never more surprised in my life.

3914. Are you aware that the liquid of sewage is infinitely more valuable than the solid?—When we take it away it is like slop, that is the water and the thick together.

3915. When you take away 12 tons of this material you do not suppose that if it was dried up it would make even two tons?—I do not suppose that it would.

3916. So that it is a very deceptive quantity?—Yes.

3917. That might moderate your view, and would not prove that it was of no value?—Certainly. It is of value if the cartage is not too much. When we took this sewage out the board advertised for parties to take it away, and they could not get anyone to take it away, and I took it myself. I drew it from two and a half to three miles, and I found that it cost me a great deal of money. I weighed every waggon-load which I drew up. Three tons cost me from 8*s.* to 10*s.* I do not think that there is much difference between the thick matter and the thin.

3918. What is the area of the filter-beds?—There are six filter-beds, and they are 40 feet long, 6 feet wide and 4 feet 6 deep. Then there are two filtering beds of stone, into which we put the worst matter. They are 20 feet by 8 feet by 4 feet 6, but we only fill them 4 feet.

3919. That is for a population of 10,000?—But there is not more than half of our parish drained. You may put down 6,000.

3920. (*Chairman.*) The population of Enfield town and Ponder's End is about 6,000?—It is about that; it is the largest parish which there is round London. I think that there are between 12,000 and 13,000 acres of land in it.

3921. Do you know what your rateable value is?—It has been raised; now it is 60,000*l.* odd.

3922. Has there ever been any talk locally of cutting off the town from the parish?—I have never heard of anything of the sort.

3923. You maintain the highways over the whole of the parish?—Yes.

3924. And levy a rate over the entire area?—Yes.

3925. (*Professor Way.*) Do you know the method of precipitating by lime as practised at Tottenham?—I have seen it.

3926. Which of the two methods do you like best, the straining of the liquid as you do it, or the mode which they adopt at Tottenham?—Most decidedly the straining through gravel.

3927. In neither case do you take out the valuable material?—I am quite aware of that.

3928. And in neither case do you purify the water?—No.

3929. (*Chairman.*) You clarify the water but do not purify it?—Yes; I think that the only way to purify it is by irrigation.

3930. Have you seen any irrigation works?—Yes.

3931. Where?—At Croydon.

3932. Have you ever tried irrigation in your case?—No; we have had no opportunity of doing so.

3933. Is there any land below you which you could irrigate with the sewage?—There would be some difficulty in it, but I have no doubt that it might be done at less expense than we are at in dealing with our sewage. The East London Waterworks Company are bound to find us a sewer, and they have put it in. I am quite convinced that we do not put nearly so much sewage into the river Lee as we did ten years ago.

3934. You are less sinners now than you were at that time?—Decidedly; when all that we had consisted of cesspools and overflows, and so on.

3935. At all events whatever there is in your water when it passes away from your works it goes into the river Lee at the point where it enters?—Yes.

3936. And if there is any sewage in your water it goes in?—Yes.

3937. (*Professor Way.*) You say that the East London Waterworks Company were bound to give you this sewer?—Yes, by their Act of Parliament.

3938. Supposing that any action was taken would it be taken against your local board or against the

TOTTENHAM.

Mr. W. Ironside.

18 Dec. 1866.

East London Waterworks Company?—I am not competent to answer that question.

3939. (*Mr. Harrison.*) You have a right to discharge into the intercepting channel which they have formed?—Yes.

3940. And if there is any lawsuit it must go against them?—I should think so. Where our sewer discharged itself into the sewage cut there was a complaint at Ponder's End. We made a complaint to the East London Waterworks Company, and they put in some 2-feet pipes and carried it down a certain distance to do away with it.

3941. That cut was purposely made to intercept your sewage, so that it might not go into the river from which the East London Waterworks Company take their water?—Certainly.

3942. So that if you might not discharge your sewage into it it would not be doing the duty for which it was specially formed?—Certainly; it was made for the express purpose.

3943. How far is it continued up opposite to Enfield?—It is continued up to where our sewer joins it.

3944. Do the towns and villages above discharge into it?—Enfield highway discharges into it, but there are common cesspools and privies.

3945. Is Enfield highway in your parish?—Yes; and also Enfield Chace.

3946. Is it not sewered?—No; the populous part of Enfield, namely, Enfield town and Ponder's End, is sewered, but not Enfield highway or Enfield Chace.

3947. The New River passes through your town?—Yes.

3948. Is the water there very nicely kept?—Yes.

3949. And all sources of pollution are kept out of it?—Yes. I think that the New River Company are as careful of the water as they can be.

The witness withdrew.

Mr. W. Cakebread.

Mr. William Cakebread (Chipping Barnet) examined.

3950. (*Chairman.*) What is your occupation?—I am surveyor to the local board of Chipping Barnet.

3951. For what length of time have you been their surveyor?—Scarcely two years.

3952. How long is it since they adopted the Local Government Act?—Upwards of three years.

3953. What is the population of Barnet?—About 3,000 within the local district.

3954. What is the area in acres?—It is simply the town; they do not take the parish.

3955. Do you know the rateable value?—I could not state the rateable value of the town.

3956. Have you any system of sewerage there?—Not anything else than what previously existed, except that some sewers have been deepened; there has been one sewer constructed within the last year down the new road which leads to St. Albans; and 1,800 feet of surface drainage to take the water from the roads.

3957. Have the houses cesspools and privies?—The houses in Barnet consist in a great measure of small houses, and the principal part of these small houses have cesspools; pans and traps have been put in instead of the old system of cesspools to a number of houses, but the greater number of houses still use the old form of cesspool.

3958. Where does the sewage get to?—It goes in various directions.

3959. Does any of it get from the ditches into the Lee?—On the eastern side of the town the drainage passes down a number of ditches and goes to East Barnet, and of course enters the Lee.

3960. Is there any water supply?—No; there are no public waterworks; the hill is full of water.

3961. And you get it from wells and pumps?—Yes.

3962. Have there been any complaints as to the foulness of the ditches, caused by the overflowings from the cesspits and the ditches?—No serious complaints of any description.

3963. Are those ditches sweet in summer?—The local board have prevented, as far as it was in their power to prevent it, the stench from the ditches by covering them in, so as to carry the matter off by pipes.

3964. When it passes off by pipes where does the sewage go?—It passes down the different ditches, depositing this sewage, and before it reaches the water which we call East Barnet brook the water becomes quite clear.

3965. And it then passes into the river?—Yes.

3966. And it then goes down to the Londoners for them to drink?—Yes.

3967. (*Professor Way.*) Mr. Beardmore says that it goes into a catchwater; is that so?—It passes into ponds before it is sent in the direction of Colney Hatch.

3968. That catchwater delivers below the intake of the East London Waterworks?—It goes on, I believe, to Colney Hatch, and in that direction.

3969. (*Chairman.*) It goes into the same catch drain which takes the Enfield sewage, and does not go into the East London Waterworks?—I am scarcely acquainted with the progress of it.

3970. Is there any talk in your board of making sewers?—Not otherwise than they are now making; they are continually making sewers where it is necessary. Lately I have had the management of upwards of 1,500 feet of drainage.

3971. Is the place at all growing in population?—Not the town of Barnet; the district is growing, but not within the area of the local board.

3972. Then that does not affect your works?—No; there is scarcely a possibility for the old town to increase.

3973. It has grown up so that it is as tight as it can be?—There is but little land available for building in the local district.

The witness withdrew.

Mr. C. Baxter.

Mr. Charles Baxter (East Barnet) examined.

3974. (*Chairman.*) What are you?—I am simply a member of the Nuisance Removal Committee, under the Nuisance Removal Act of 1855. Our parish of East Barnet is very small; we have no local board or authority of any kind whatever.

3975. What is the population of East Barnet?—At the last census it was below 900.

3976. Have you any cesspits or cesspools, or privies, or drains of any kind in the place?—The majority of the old part of the parish has cesspools.

3977. Do they overflow out into ditches?—The overflow goes into ditches.

3978. Does any of it get down into the streams of the district?—Yes, it gets down into the stream which the Commissioners have heard alluded to over and over again.

3979. And into the intercepting drain?—And into the intercepting drain in Angel Lane.

3980. What duties do the Nuisance Committee perform?—They are to inspect the cesspools or any yard or place which is likely to be a nuisance, and to see that their inspector carries out their instructions.

3981. Have you power to pay an inspector?—Yes.

3982. Have you a surveyor?—Not otherwise than the inspector.

3983. The same person fills both offices?—Yes; we have no power to borrow money for improvements or drains, we have only power to value the property

which we consider requires drainage, and by the Act of Parliament we can only levy a rate of 1*s.* in the pound upon that property, so that it is scarcely possible to make any drainage with that money.

3984. Have your board looked at the new Act of Parliament which was passed in the last session, giving enlarged powers to Nuisance Committees?—Yes, and the parish have taken it in hand; they have formed a board as they think in accordance with the Act.

3985. Has there been any complaint to your board of the ditches, as to the outfall of the sewers, or otherwise?—Not particularly in that respect. There is a strong complaint of fouling the stream in consequence of the considerable sewers which are in operation, over which our present committee has no authority. There is what we call a new part of East Barnet, which is increasing very rapidly. It is on the extreme west, adjoining Chipping Barnet. It is under the British Land Company; they bought an estate there, and they have laid it out, and an immense quantity of houses have been put up, and it is sewered. That portion of East Barnet is sewered very perfectly, and there is a good quantity of water upon it from an artesian well.

3986. Where does your outlet water go to?—Into this stream. They have four sewers discharging into this stream, and in one or two of them they have made great attempts to purify the sewage by the absorbing wells. They first bored one 300 feet, and now they have sunk one of four feet diameter.

3987. Did they sink it into the chalk?—No, but into the green sand.

3988. I suppose that you do not question what becomes of the sewage so long as it goes away?—Our only doubt is whether it will go away.

3989. You will be quite content to send it that way, if it will go away?—We shall be quite content with an outlet somewhere.

3990. It would not be an outlet, but it would be an inlet?—It would be a question whether it would go to our parish if it were so many feet deep.

3991. Is there any agricultural land near the outlet of your drain where the sewage could be put on?—Not without great difficulty, and not without great expense. I have made an attempt to put it over land, but the fact is, that nearly all our land is ornamental land, residential estates, and gentlemen's property, and it is very valuable for that purpose, and unless it was purchased right out at a great cost we should not be able to turn the sewage over it.

3992. At what does land now sell?—It is as high as 300*l.* an acre.

3993. For building purposes?—Yes.

3994. What did the British Land Company give for their land?—It is some years since they purchased it. It was contemporaneously with the establishment of the Great Northern Railway.

3995. How many acres have they?—I should think, at a rough guess, 300; it is quite as much as that.

3996. What number of houses have they put on?—There are over 500 houses in our parish.

3997. That would represent a population of 2,000 people?—I daresay that it is that number now. It has considerably increased since the last census.

3998. Then they manage themselves, drain themselves, and give themselves a supply of water?—Yes, and a very good supply of water indeed.

3999. Have they a committee in the shape of a local board to carry it out?—No, they carry it out independently, and sell their land so as to cover the expense.

4000. Are they within your area; have you power to rate them for anything?—No, we have no power to rate any person, except in the case of houses which we improve by drainage, and then only to the extent of 1*s.* in the pound per annum.

4001. And they must add some nuisance which you can complain of legally in order for you to interfere?—Yes; we had occasion to complain of their sewage last year, and we used that authority, and without taking any legal steps. We represented to them the desirability of cutting off their sewage some 40 yards before it passed this brook, and they passed it through burnt ballast at our representation.

4002. They strained the solids out of it?—Yes.

4003. Does that go on now?—Yes, at all the mouths of their sewers, excepting at the absorbing well.

4004. (*Mr. Harrison.*) Do they sell the land upon which these houses have been built?—Yes.

4005. How much per square yard do they get for the land when they sell it for building purposes?—I could not exactly state that; very small plots were sold for 50*l.* at the last sale which they had.

4006. What would be the size of one of those plots?—Perhaps three times as large as this room. I am speaking very much at sea in that respect. It is not my forte at all.

4007. What is the agricultural value of land in the neighbourhood?—I may take it at two guineas just in our immediate neighbourhood. It is cold, stiff clay.

4008. (*Professor Way.*) What number of people do you say would drain into these absorbing wells?—Into that one sewer, where the absorbing well is, there would perhaps not be more than 50 houses.

4009. That is 200 people?—Yes.

4010. Supposing the principle to be carried out do you know that the drainage, so draining into those wells, would go through some porous beds of some kind if they succeeded at all?—If they succeeded at all it would.

4011. And those porous beds in all probability would be the beds where water would be obtained from deep wells?—Exactly so.

4012. So that for the sake of carrying off the sewage of 200 people the drinking water of 2,000 people or more might be poisoned?—It does not appear that that is at all likely, for it does not answer at all; it was tried at the Colney Hatch Asylum, and I believe that it is a failure in both cases.

4013. Presuming it to be successful do you, as a person knowing how water supply is carried out for a population, think that that is a proper system?—Hardly.

4014. Supposing it to be carried out, where would the wells be?—The water I think would not be so pure.

4015. Do you not think that it is a system to be reprehended by every possible means?—I think so.

The witness withdrew.

Mr. Joseph Gilbert Blair Marshall, M.A. (West Ham), examined.

4016. (*Chairman.*) You are engineer to the local board of West Ham?—Yes.

4017. How long have you been their engineer?—About seven years.

4018. Do you remember the area of the district?—I do not at this moment remember it exactly, but it has been so often ascertained and published that it is a notorious fact; it is about five miles long by four miles wide in round figures.

4019. West Ham has been sewered?—It has.

4020. Where is the outlet?—Near Bow Creek, on the river Lee.

4021. What is the population of West Ham?—I should think that it is at present some 60,000.

4022. What is the number of houses which you have drained?—We have drained about 8,000 houses, out of the whole number of 10,000 to 11,000.

4023. In draining those houses have you substituted waterclosets for open privies?—In every case.

4024. Have you much trouble in managing those waterclosets to keep them clean?—I may say none; we seldom know what trouble is in that respect.

4025. Is the water supply in the hands of a company?—Yes, we depend upon the East London Waterworks Company entirely.

TOTTENHAM.

Mr. J. G. B. Marshall, M.A.

18 Dec. 1866.

4026. Do they supply the entire district?—They do.

4027. Is there any difficulty in obtaining water from them for the supply?—I can hardly say that there is; of course there are complaints, as complaints will arise everywhere, but I do not think that the company are unreasonable; generally we have an abundant supply.

4028. Is your district growing?—Very rapidly indeed.

4029. You have plans I suppose laid before you?—Yes, every fortnight.

4030. Have you any idea of how much it has grown between 1851 and 1861, and from 1861 to the present time?—Yes. I forget it now, but I did reckon that matter a few days ago.

4031. It is growing rapidly?—Very rapidly. I may say that every fortnight we have proposals to build at least 50 houses on the average all the year round.

4032. What is your present rateable value?—It is 160,000*l.* in round figures.

4033. What is your present debt for main sewerage and other purposes?—It exceeds 100,000*l.*; I should say that it approaches to 110,000*l.* or 112,000*l.*

4034. Some of that would be for private improvements, for street formation?—Yes.

4035. Do you know how much out of that sum is for street forming?—Probably 20,000*l.*

4036. Those would be private improvements?—Yes, recoverable from owners of property.

4037. Then your main debt is upon the sewerage?—Yes, that is the ratepayers, main debt.

4038. A great portion of the sewage I believe is pumped into the Lee?—We do pump a great deal, but at the same time not the greatest quantity; we also discharge by gravitation.

4039. About what does that pumping cost you a year?—About 1,000*l.* a year in round figures.

4040. Have you tried irrigation upon any portion of the land in your possession?—Only upon an experimental scale; we have a portion of land adjoining the pumping station, where we have made some experiments.

4041. On what area?—About an acre.

4042. What result did you get from the irrigation of that acre?—In rye grass we produced five most abundant crops, some of which we converted into hay with bad results.

4043. Was the weather against you during the time that you were making the experiment?—Yes, three crops out of the five would be incapable of conversion into hay in consequence of the uncertainty of the season.

4044. What impression has that experiment left upon your mind with regard to irrigation, if you could cut your crops green and remove them and find a ready market?—The impression that the result would decidedly be profitable and most beneficial to the district, and my inference is that that is the proper thing to do with the sewage in the vicinity of London or other large towns where the crop may be immediately removed green.

4045. Do you think that if you had land enough you could dispose of your sewage in that district upon the land and not cause a nuisance?—If there was sufficient land we could dispose of every drop of the sewage in that manner. I have no hesitation in saying that if I had sufficient power and sufficient area I could convert every drop of the sewage into good wholesome food for cattle.

4046. Do you think that that area could be got adjoining your works?—It might be got, but it is more valuable for other purposes.

4047. That marsh area is especially valuable as accommodation land, is it not?—Yes.

4048. At what is that land now taken per acre?—3*l.* or 4*l.*, but it is being rapidly absorbed for commerce, and for the purposes of the City of London docks and habitations for dock people, and for ship constructors, and factories for chemicals, and all sorts of things. They are being spued out of London and across Bow Common, and they are being shot over the Lee, and they find convenient localities there; and for these purposes the land is more valuable than it would be for the growth of grass for cattle.

4049. What is your experience with regard to the mode of ventilation adopted on the the main sewers at West Ham?—I think that, practically speaking, it is perfect.

4050. Have you occasion to have some of the flatter sewers cleansed by hand at times?—We have had occasion to do so about twice in the seven years.

4051. Not more?—Not more.

4052. Do you know what the gradient of those sewers is near the pumping works?—Yes, it is very flat, one portion is horizontal.

4053. Do you find any difficulty in keeping that portion clean without manual labour?—We have never had occasion to touch it, but that is close by the pumps, and the draught is exceedingly rapid; it clears itself as clean as a whistle.

4054. Do you occasionally adopt the means which you have at many points for flushing?—Yes, but only very occasionally. We found it expedient during the last summer to wash out the sewers. I believe that we should not have had occasion to do so, except to please the people on account of the cholera. We did wash them down, there was so much sentiment in the affair that we did it to please the people.

4055. Have you had much choking?—Never with the main sewers.

4056. Do your drains much trouble you with choking?—Very seldom; it is quite an accident if a stoppage takes place.

4057. Have you had much difficulty where the sewers cross the navigable portions of the river Lee?—We have never had the slightest difficulty.

4058. Have you considered the question of the ultimate disposal of the sewage if it is to be kept out of the Lee and out of the Thames?—I have considered very carefully the subject of dealing with our sewage, that is to say our outfalls. Of course it is not at all satisfactory, though the discharge into the river Lee enters even so low down as the Thames, and we are under some degree of pressure to alter that discharge. Latterly we have been deodorizing by the application of carbolic acid and per-chloride of iron.

4059. Is it the fact that the Lee itself, supposing that you did not pass one ounce into it, is quite as foul as your sewage before you pass anything into it?—I should say that it was absolutely as foul; it looks as foul, and certainly no sensible impression is produced on the river Lee that I could ever detect, even when we are pumping into it in all times of the tide.

4060. The river Lee is a tidal river, and a large area of bank is exposed every tide?—It is so each tide.

4061. In what condition are those banks when they are so exposed?—They are covered with a slimy deposit of mud, of a most offensive appearance, and certainly with no agreeable smell.

4062. In hot weather, what kind of sensation have you, when walking near that mud?—I always have the sensation that I should like to be somewhere else.

4063. Then, before the river Lee can be made satisfactory, I suppose that it must be freed from this sewage, and something must be done to cleanse those mud banks, or to remove the mud?—Yes, or probably they would cleanse themselves.

4064. Do you think that any tidal channels of that kind ever cleanse themselves?—I question it, but I hope that they would become clean if the Thames was made clean and the upper part was made pure.

4065. Have you ever had occasion to consider the upland water of the river Lee?—Yes, it came specially under my attention.

4066. Is there a large growth of population at Silvertown?—There is an enormous population springing up there; there are some 500 people I suppose living there; there are houses for them, and large works are being built.

4067. Have you done anything for the sewerage of

Silvertown ?—Nothing; it is polluting the neighbourhood, and it is polluting the ditches.

4068. Have you had much surface flooding during these last heavy rains ?—We have had no surface flooding of any magnitude this season, but last year, after the snow, we had the region between Tottenham and Stratford and Lee Bridge covered with water.

4069. Has it been so within the last three weeks or a fortnight ?—Not to my knowledge; I am aware of several impediments on the Lee, but I am not prepared to attribute that flooding to any impediment within my knowledge.

4070. You are not the engineer of the Lee ?—No; in the district of West Ham we have scarcely any surface flooding now, in fact, I may say, none.

4071. Have you any idea how many surface gullies you have ?—We have about 1,500.

4072. They take away the water into the sewers and the sewers convey it down into the outlet ?—They do.

4073. Have you had any floodings from the sewers being too full ?—We have had a few overflows in cellars; I may say that it has never quite reached the surface of the ground.

4074. That is in some of the low cellars by Barking Road ?—Yes, we had two or three occasions on which it occurred.

4075. The surface of the ground there is some six or seven feet below high-water line ?—The surface of the ground there is 14 feet below high-water line.

4076. I think that you let all the persons who dug out the surface there, and made those cellars, do it upon their own responsibility ?—We did not let them do it; when they have dug cellars they have done it on their own responsibility.

4077. (*Mr. Harrison.*) It is of no use raising the whole district several feet, and then when you do it for different persons to dig down again; they must do it at their own risk ?—Yes.

4078. You say that London, as it were, spues out these large manufactories into the Ham marshes. What is the value of the land at Ham marsh; it is about 3*l.* an acre you have said ?—It lets for that per acre; if you went into the market to buy it you must probably pay 120*l.* an acre for the marsh land.

4079. An increased price would be put on for the prospective value which it would probably have to the buyer ?—Doubtless in consequence of its proximity to London.

4080. What is the value of the land when it is purchased for manufactories ?—It varies very much. On the banks of the river Thames, or near the navigable streams, it fetches as much as 1,500*l.* to 1,800*l.* an acre. I do not say that you could buy the land at any time near the river for 120*l.* an acre; it is not the same land as I was speaking of when I gave you that price.

4081. You mean land further away from the river ?—Yes, agricultural land, grazing ground.

4082. Supposing that manufactories were erected adjoining the river for a considerable distance below Bow Creek, what would then become the value of the Ham land within the land on which those manufactories were built ?—It would probably then be worth, for building purposes, 800*l.* to 1,000*l.* an acre, sold in plots as ordinary building land.

4083. Considering the question of your inability at Ham to obtain this land for the application of your sewage, in consequence of its increased value, it seems to point out that that land subsequently may fairly be put to a considerable expense to carry the sewage from it to a great distance off in consequence of its great increase of value ?—Doubtless.

4084. And that argument would work back into the whole of London. Any town which is so increasing that the rental is an imaginary value, so that the land cannot be obtained for irrigation purposes, may fairly be put to the expense of carrying the sewage beyond that limit to apply it to the land ?—Undoubtedly.

4085. I think that the arrangement is that your outfall at present is merely a temporary one ?—That is all.

4086. Is it understood to be a temporary one ?—It is understood to be of a temporary character; it is not a temporary structure, there is nothing temporary about it; it is a good and efficient, and is a well working, and well-constructed piece of machinery; at the same time its position and its circumstances can only be looked upon as of a temporary nature.

4087. And the actual understanding, if not arrangement, with the River Lee Navigation Company is to the effect that it is only temporary ?—In point of fact that is so. I believe that there is a written understanding between the board of health at West Ham and the river Lee authorities, that when called upon the board shall do something. I cannot exactly say what; it is impossible to say at the present time what can be done, but the understanding is that the board shall do what can be done to make things better.

4088. Have your board considered what can be done ?—They have. I have been instructed by my board to consider what can be done.

4089. What have you reported ?—In the first place I was instructed to consider whether the sewage of the district of West Ham could be disposed of by discharging it into the low-level reception place of the metropolitan board, which is in the centre of our district at the Abbey Mills, leaving it to the metropolitan board to lift our sewage and dispose of it as best they could, and we paying them such terms as could be arranged between us. In considering that subject with their engineer we came to the conclusion that that was not the best nor indeed the proper thing to do; but considering that the metropolitan board themselves were under the obligation of sewering a part of the county of Kent, which lies on the north side of the river Thames, and which includes the populous place of North Woolwich, and that they were under the obligation to provide an outfall sewer and pumping works for it, and considering that the local board of the district of West Ham were under the obligation of providing for the sewage of what we call the district of Silvertown, that is the area lying between the Victoria Docks and the river Thames, and which is not sewered, and is a sort of isolated district cut off by the Victoria Docks from the other portion of our district, and considering that the low portion of the East Ham marshes would ultimately require sewerage, we after careful consideration came to the conclusion that the right thing to do was to make a good outfall sewer straight away from our present outfall works, picking up our works there, and carrying it right down to the banks of the river Thames near Barking Creek, in fact as far down the river as the metropolitan board has gone; that we should pick up our drains at the Barking Road, and carry our works down to the banks of the Thames, and there place a pumping station, at the same time carrying a branch sewer down through our Silvertown district, through the metropolitan works in the North Woolwich district, and also giving an opportunity for the district of East Ham to drain into it, and erecting on the banks of the Thames a proper pumping station with adequate machinery to deal with the whole, on a sufficiently grand scale to meet all the requirements of the various parties whom we should thus serve.

4090. Do you mean by putting the sewage on to the land or by delivering it into the river ?—We have got to the point of lifting it, the question of what we should do when we have lifted it is a moot question. I cannot tell you what can be done, but if we can get there with our sewage we shall at least have done all that other people have been able to do, and all that anybody can tell us how to do with benefit. If we must throw the sewage into the river when we get it there we must do so; if other people must throw it into the river, so we must throw it into the river; but if other people can take it on to land, so we should have an opportunity of taking it on to land, and if other people can devise any means of utilizing it by converting it into gold dust or anything of that kind,

TOTTENHAM.

Mr. J. C. B. Marshall, M.A.

18 Dec. 1866.

then of course we should have the same opportunity of making it into gold dust.

4091. But I think that you told us that you had made an experiment on a small scale, and that the result of that experiment was that you could make it into gold dust?—My experiments undoubtedly persuade me that the right thing to do with it is to convert it into rye grass, for the nourishment of the horses and cattle of London, and of the cattle which now browse on the Essex marshes, because of course there it would be in the centre of the Essex marshes.

4092. Could you now get land at that distance down the river at a reasonable rate for the application of the sewage to it?—I think so.

4093. If so, would it be a wise thing for your board to take steps to do so at once?—I think so, but whether the board would do it is another matter. I should certainly advise them to do it.

4094. (*Chairman.*) I suppose that the board generally give you advice?—They give me more than advice.

4095. (*Mr. Harrison.*) You do not mean to say that you do not find that they are advised by you?—I very often find them indisposed to go into anything of a speculative kind, any scheme of any great magnitude; in fact they like to keep their enterprises pretty well at home.

4096. As to the occupation of a site of land at Bow Creek, does not your sewage form a considerable part of the polluted water which passes into Bow Creek?—I think not. Our sewage is discharged in two ways. The first mode is by gravitation, when the tide permits. I take it that it runs away with the tide, out into the open stream of the Thames, into a large volume of water. Then we pump. When the tide returns it very soon shuts up our discharging opportunity. It shuts up our self-acting sluices, and then we fall back upon the use of our pumps, and we use them with a little discretion as to how we shall throw the sewage into the tide, we take care as much as possible that it shall only be done when the tide is flowing out, and we calculate upon the sewage going with the river, not up the river but down.

4097. By gravitation it passes out when the tide is receding, and when the tide rising stops the outlet there is no discharge at all for a certain period?—That is so.

4098. When the tide begins to recede again after its flowing you pump so that the sewage shall go into the water when it is receding from Bow Creek?—Yes. Our sewers retain it for a certain time till the water gets up to high tide.

4099. (*Chairman.*) They form a tank?—Yes.

4100. (*Mr. Harrison.*) So that by management in that way you think that very little of the sewage from your discharge goes back up the river Lee?—Very little.

4101. Have you attended much to the supply of water to the poor tenants in West Ham?—I have had occasion very particularly to attend to it; in fact, in carrying out the drainage of the houses, which we have done very generally, in every case where we lay in a drain to a house we insist on the owner providing a tank to hold water to flush the closets, and to supply the house at the same time. We have taken advantage of the opportunity, and concurrently with the laying of the drains we have insisted upon the houses being properly supplied with water for the tenants.

4102. What sized tank can you supply?—About 3 feet by 18 inches, by 15 inches deep, or thereabouts.

4103. Upon the average how many gallons a day would it supply to the household?—From 30 to 40 gallons.

4104. Is the system at West Ham intermittent?—Yes; there is some constant supply throughout the district, but as a general rule it is intermittent. The supply is turned on in the morning, and the cisterns are filled. We trust to Providence after that.

4105. You take the supervision of the tanks of the poorer tenants, and you make it obligatory upon the owners of the property to supply such tanks as are necessary?—We have not taken the supervision, because that is in the hands of the water company who supply the water, but we have taken the opportunity of compelling owners to supply water to tenements where a water supply did not previously exist. In a great many cases we have done so.

4106. Is the power which you have exercised in that case one which you could legally enforce?—Yes. We have never exercised it unless we could legally enforce it, at least we have never in that case attempted to exercise it legally. We have exercised power in two ways. In the first place we have exercised moral power. When the owners of the property have had their drains laid in we cautioned them against having waterclosets without water supply. In many cases we could not, from the limited powers of the Act, compel them to have water, but in many other cases we have been able to compel them to have it, and in fact by the co-operation of the waterworks company, by giving us special rates, in some cases we have been able to do it.

4107. Do you think that in all cases, if the local boards in the parishes of London co-operated with the water companies, they could enforce a similar system?—From my experience I should certainly say so, by forcing and coaxing.

4108. You find that where the coaxing system will not do the forcing system answers?—Yes; but just let me point out a very important hitch here. We have found that the price fixed by the Public Health Act, namely 2*d.* a week, is too limited. We find that the waterworks company's rate exceeds 2*d.*, and when it exceeds 2*d.* we are powerless. When a supply is wanted the company decline to give it. If we cannot supply it at 4*s.* 4*d.* a half-year to the tenements, we cannot compel the owners to supply it at all; that is too low a rate.

4109. (*Chairman.*) You would have power to compel the owners of property to take the water at the company's published scale of charges?—At the authorized scale of charges, decidedly. In some cases I have been obliged to ask for a special rate to enable me to report to the board that it was within the powers of the Act.

4110. In those cases you have referred to, where there is an overflow from the tank, is there a ball tap?—No. The waterworks company object to that; they think that the people might let the water run on to waste, and they object to put an overflow.

4111. (*Professor Way.*) You are, I think, an advocate for the application of sewage to land?—Not particularly an advocate for it.

4112. You believe, do you not, that it would answer to apply sewage to land. You say that this valley cannot be kept pure unless the sewage is intercepted, which no doubt is the case, but in intercepting it, supposing you go further up the valley, I presume you would be collecting all the sewage and bringing it down to rather valuable land before it was distributed?—Lower down, it may be valuable land.

4113. And subsequently it would have to be distributed again?—Yes.

4114. Would it not be better to deal with the sewage at certain spots where you would have all the advantages of the intercepting sewer, the object being to carry the sewage from the small towns to a point where it could be concentrated, and from which it could afterwards be distributed?—I may explain that as a matter of detail, adverting to this proposition, I omitted to notice, [and I am sorry I have not got it,] the written description by Mr. Bailey Denton; but if you will refer to it you will find that the point to which you have referred has not escaped our consideration. We propose, of course, as we come down the valley, to intercept all such sewage as we can find available for irrigation, wherever we can find land to apply it to. We propose at every point to deal with the sewage as we come down the valley in the most efficient way; but we know that we must have an

ultimate outlet to take that which we cannot deal with in any other way. Anything that we can catch at a higher level up the valley and send down to the lower district, and there deal with, of course we should catch; but we know that we must have an outlet, and power to deal with that which gets to the outlet, which we cannot possibly deal with in an intercepting way.

4115. The quantity that could be so distributed is now unknown?—Quite so; and the great difficulty is to get land in suitable positions, and, again, people will not have it. It is well enough for me to be an advocate for the production of rye grass, or celery, greens, peas, and vegetables of all sorts, which I have produced, but people will not have sewage irrigation near their habitations.

4116. (*Chairman.*) And yet they will make top dressings of putrid manure, which is 20 times more offensive?—Undoubtedly; and they will leave it there reeking in the sun for days and days, whereas this stuff would go away, and it would be all settled in six hours.

4117. (*Professor Way.*) Like most other popular prejudices, do you not think this will pass away in a few years?—I hope so.

4118. Consequently, you might hope to find within reach of all these towns land for the application of their sewage without taking it down to a place from which you must discharge it into the river, or set to work on a large scale to distribute it?—Yes; I hope that condition of things will come to pass, but I should never be able to get over the necessity for a good outfall sewer, and for this reason, that however complete irrigation may be in its arrangements, and however well you may have everything fitted for irrigation, still a heavy rain will sometimes come at the rate of three quarters of an inch in three or four hours, and then the water will run down into the lower regions. Acts of Parliament will not stop gravitation, and injunctions in chancery will not stop the river Lee. The water will go down, and of course it will carry dirt out of the sewerage and out of the streams from every source into the channel of the Lee, and if we drink that water it will be nonsense to say that we can drink it with impunity and without risk; it will be dirt if you let this water go into the river Lee at all.

The witness withdrew.

The witness subsequently forwarded to the Commissioners the following Report:—

REPORT urnished by J. G. B. MARSHALL, ESQ., C.E., Engineer to the LOCAL BOARD of HEALTH at WEST HAM, upon the Sanitary Arrangements of WEST HAM.

Stratford, 18th February 1867.

The area of the district of West Ham is nearly 5,000 acres.

The population is now about 60,000.

The number of houses about 12,000.

Of these there have been drained 10,000 with waterclosets; water supply dustbins, yard pavements and surface water, roof drainage and ventilation complete.

The houses are chiefly six-roomed cottage residences of artizans and their families, many of them I am sorry to say being improperly crowded to their roofs.

The cost of drainage, providing and fitting in sink, soil-pan, dustbin, and yard paving, may be averaged at 6*l.* per house; this cost is in each case defrayed by the owners or leaseholders, or in some cases by arrangement between them.

To the question, What per-centage of chokings or stoppages has there been in house drains, sinks, and waterclosets? I can only answer, "There is no such thing here as choking;" an occasional failure may take place from bad workmanship or neglect of the principles laid down for the guidance of the men and shown on the sheet of details, one of which is issued to every person who has to put in house-drains, &c.

An inspector from my office attends and sees every pipe properly jointed, and every portion of the work completed, before it is covered up, and the reducing discussed for the closet-pans, making every pipe-drain which is beyond the reach of a man's hand 6 inches in diameter, guards against anything getting into a pipe-drain which is likely to stop it. In all cases the pipe-drains are laid with uniform inclinations from the surface to the sewers, which prevents stagnation and ultimate choking.

The recent severe frost caused no mischief or extra expense after its disappearance.

My experience here as to the relative advantages of waterclosets over privies and cesspools is not a fair general guide, because in a flat marshy district like West Ham, with a clay subsoil always saturated with water, privy cesspools cannot exist; there must be an overflow somewhere. Here I found such cesspits discharging their contents into open ditches and polluting the atmosphere frightfully; the only cure was conversion into waterclosets; simultaneously with this alteration I have filled up the ditches and introduced means of supplying water for flushing and domestic use. I have also drained all yards, sinks, and roofs, using rainwater pipes as ventilators, for which they serve admirably, and keep the drains free from gases.* It is impossible fully to describe the beneficial effect of the alteration in the premises produced by these means. In many instances the inhabitants have become of a higher grade, and health and comfort must have been greatly improved.

Of course other evils of overcrowding, uncertainty of food and clothing—human improvidence—remain unabated; and diseases still exist, but not to the same extent and virulence as before the works existed. The mortality, which was formerly very high, would now be found moderate, if not very low, in certain seasons, were *the infant mortality* not so excessive as it is.

I have now only time to give these naked facts, but any information or opinions on points constantly under my notice are quite at your service; and of course you are at perfect liberty to make any use of them, either for your own purposes or for the public good.

J. G. B. MARSHALL, M.A. and M.E.

* The whole of the main sewers in West Ham are ventilated at several 100 manholes, the gases in all cases filtering through charcoal. Down-spouts are not therefore relied on. Sewers cannot be fully ventilated by down-spouts.—R.R.

Mr. WILLIAM DELANO (Tottenham) examined.

4119. (*Chairman.*) What are you?—An agriculturist.

4120. Where do you reside?—I reside near Park station, in the parish of Tottenham.

4121. Are you officially connected with any of the local boards?—No, not with any of them.

4122. Are you a ratepayer?—Yes; I pay rates to the parish of Enfield, the parish of Edmonton, the parish of Tottenham, and the parish of Hornsey.

4123. To what particular points in connexion with this inquiry do you wish to speak?—I wish to speak upon the whole matter of the inquiry, and first upon the pollution by town sewage.

4124. Do you mean the pollution of the river Lee?—Yes.

4125. That is polluted from town sewage?—Yes, in certain places it is so, but the pollution from town sewage, I take it, is not now very great.

4126. I suppose it is a fact that all the sewage from the different towns and villages finds its way into the natural outlet of the valley by drainage?—Not of all the towns.

4127. I suppose it gets into the Lee ultimately?—Yes, ultimately; but very low down, below Tottenham. The Lee is almost a common sewer at its outfall into the Thames.

4128. Is the river Lee polluted by any other forms of refuse?—I take it that the river Lee proper would be affected a little by the towns on its margin, or at those places where the sewage of a town enters it.

4129. Have you been to Luton?—No.

4130. Have you been to Bishop Stortford?—Yes.

TOTTENHAM.

Mr. W. Delano.

18 Dec. 1866.

4131. Have you inquired specially into the pollution of the Stort by the sewage of Bishop Stortford?—No, I have not.

4132. Nor into the pollution of the Lee at Luton?—No.

4133. Have you paid any special attention to the sewage of Hertford?—I believe it is intercepted by the works of the New River Company, and therefore there is very little matter, I take it, that comes in from Hertford; but when you come down to Ware, there I expect there is some feculent matter that comes into the river, and from other places in its course. I may say that I hope to see a water supply extended to this place. You have heard how yellow the water is, and I hope we shall have the water from the Tottenham Board Supply. If the East London Water Company will take the initiative, and make a sewer on each side, then I think there will be nothing to complain of as to contaminating the water.

4134. Where do you get your drinking water from?—From a well.

4135. Then you are not interested in a supply of water to Tottenham?—Only in the enormous expense the board will be put to in providing water.

4136. You say you have not been to Luton?—Yes.

4137. Do you know that there are many tons of poison discharged into the river there every year?—I have seen the evidence taken at Luton, and I do not understand that it is poison.

4138. What is oxalic acid?—Of course it is poison, but it depends upon the degree to which it is put in; there is such immense filtration going on down the river Lee, four or five miles below where it comes from, that it would come down here very clear indeed.

4139. Is the river Lee now polluted by sewage?—It is in certain places, from Ware, and the new towns that are being built upon the river near Waltham Abbey. On the other hand it comes down here pure and clear from the weeds; there are aquatic plants that take up all the impurities before the water comes down here.

4140. That is your opinion?—Yes.

The witness withdrew.

Mr. J. Phillips.

Mr. JOHN PHILLIPS (Tottenham) examined.

4141. (*Chairman.*) Where do you reside?—In the high road, Tottenham.

4142. You have been, I believe, a member of the local board of Tottenham?—Yes.

4143. For how many years?—About 10 years.

4144. What special points do you wish to speak to?—The state of the river Muswell.

4145. Through which part of the parish does that river flow?—It is near the centre, generally speaking.

4146. Does it receive the sewage of any portion of the parish?—Yes, of some portion at the present time.

4147. In what condition is it?—In the summer season it is in a very filthy condition indeed, both in appearance and as regards smell.

4148. Where does the outlet fall into?—In my younger time it used to be pure, or so nearly pure that I used to like to drink the water very much. My dinners were in those days frequently cooked with it, but now at times I have not been able to bear the smell of it, particularly in hot weather.

4149. What do you think causes the pollution?—Sewage.

4150. From what source?—From waterclosets.

4151. What is the name of the street or place where the houses exist from which the sewage comes?—I should apprehend that it would be from Wood Green and Tottenham, and considerably from Hornsey.

4152. Flowing down into the Muswell?—Yes.

4153. Where does it flow to?—Into the river Lee.

4154. Does it go into the Lee below where the East London Water Company take their water?—Yes.

4155. It pollutes the water of the Lee where it goes in?—Yes.

4156. Is that within the jurisdiction of the local board of Tottenham?—Not under the present state of the law as it appears to me. The river Lee trustees prevent us from connecting our new works, and the Hornsey board have not the power to alter the present state of things.

4157. Is it necessary that there should be some additional power or higher authority to deal with the question as a whole?—I think it requires some additional power. In the summer time the river I have spoken of is in places covered with a fœtid looking scum of a dark green colour, or a pea green.

4158. Are you aware that there are other streams in the valley of the Lee quite as impure?—I know that there are others very impure.

4159. But this is the most impure within your knowledge?—Just so

4160. You would naturally wish to see it dealt with so as to be rendered pure?—Yes.

The witness withdrew.

Mr. G. Ross.

Mr. GEORGE ROSS (Tottenham) examined.

4161. (*Chairman.*) You are registrar of births and deaths?—Yes.

4162. What information have you to give about the river Muswell?—Some time ago a new cemetery was formed in this parish, and that cemetery was found to be very wet indeed. Some two or three times there has been an attempt to drain it, and the drainage of the cemetery flows into the Muswell, which I cannot think of without shuddering.

4163. You believe that some of the filtration from the cemetery may find its way through the subsoil into the Muswell?—Yes, I believe it does; it is drained into the Muswell.

4164. That tends to give it the appearance and smell which the last witness spoke of?—I presume so. The cemetery is nearer this end of the Muswell than the other. If Mr. Phillips referred to this end of the Muswell it would have a tendency to do so.

(*Mr. Phillips.*) I referred to a part higher up.

4165. (*To the witness.*) How long have you been local registrar?—From the beginning, since the Act came into force.

4166. Had you known the district before the board of health was formed, and down to the present time?—Yes.

4167. Taking the parish of Tottenham, and especially the town portion of it, what is your opinion with respect to the public health before and after the local board began to act; is it better or worse?—I cannot say that there is much difference.

4168. The population, I believe, has increased very much?—Yes, I believe it has increased very much.

4169. It was an agricultural district, was it not?—Yes, and very healthy.

4170. Now it is a town district?—Yes.

4171. And thickly peopled?—In some parts it is thickly peopled.

4172. Do you consider it remains healthy now with a population so largely increased?—Yes.

4173. Have the operations of the board been beneficial or otherwise?—I do not observe much difference.

4174. Has there been much fever in the last eight or ten years?—There has been fever occasionally, more or less, in different localities now and then.

4175. Have you ever furnished a detailed statement of the mortality of Tottenham?—Yes; every month I send to the local board a detailed statement of all the deaths that have occurred, and I have done so for the last few years.

The witness withdrew.

Adjourned to to-morrow, at 10 o'clock, at Hertford.

Hertford, Wednesday, 19th December 1866.

HERTFORD.

W. M. Armstrong, Esq.

19 Dec. 1866.

PRESENT:

ROBERT RAWLINSON, ESQ., C.B., IN THE CHAIR.

JOHN THORNHILL HARRISON, Esq. | Professor JOHN THOMAS WAY.

WILLIAM MATTHEW ARMSTRONG, Esq. (Hertford), examined.

4176. (*Chairman.*) You are mayor of Hertford?—Yes.

4177. Is Hertford an ancient municipal borough?—Yes, it is very ancient. I produce the ancient charters of the borough, at least copies of them; there is one of Charles II., which is the principal charter under which we are governed. I also produce abstracts of grants with reference to the commons. The first is the 3rd of Charles I., a grant of Hartam, Kingsmeads, and Little Hartam. Then there is a charter of Charles I. as to the corporation of the borough, and a charter of Charles II., which is the principal creating charter, and which embodies the whole of the powers given to us as a corporation.

4178. I suppose you have passed under the hands of municipal reformers?—Yes; the boundaries of the borough were enlarged for parliamentary purposes.

4179. Under the Reform Act?—By the Municipal Act.

4180. This is a municipal and parliamentary borough?—It is.

4181. What is the area of the municipal borough?—I do not know.

4182. Is the area of the municipal and the parliamentary borough the same?—No; the ancient municipal borough is very much smaller than the parliamentary borough.

4183. And the area of the municipal borough was fixed, I assume, at the time of the reform of municipal boroughs by the Commissioners?—Yes, those boundaries were then defined.

4184. Now the parliamentary borough is much larger than the municipal borough?—Yes.

4185. Was that fixed during the passing of the Reform Bill?—It was fixed under the Municipal Corporations Act, which was passed subsequently to the Reform Act. The present municipal borough and parliamentary borough are co-extensive now, but the limits of the ancient borough are still different.

4186. Have you adopted the Public Health Act or the Local Government Act in this borough?—No.

4187. Neither the one nor the other is in force?—No; we have Acts of Parliament, our own private Acts.

4188. Do you know what the population of the municipal borough at present is?—6,769.

4189. Has there been any increase since 1851, or is it an increasing district?—There has been an increase, though not a very extensive one.

4190. Is there any business of any kind carried on here?—The principal large trades which are carried on here are the oil mills; there are two extensive oil mills; one is situated in Hartam, the other is at the other end of the town.

4191. How are you situated with respect to the river Lee or any of its tributaries; there are some mills, I believe, in the town?—The Lee passes through the town.

4192. The river Mimram, is it not?—The Mimram and the Beane fall into the Lee.

4193. Is Hertford sewered?—It is very effectually sewered.

4194. At what date was the sewerage carried out?—Since the Act of 1854, called the New River Company's Act. The town has been most effectually sewered, and all the sewage is diverted from the Lee and passes to deodorizing beds.

4195. Were those works carried out under the arrangements set forth in the Act of Parliament which you named?—Yes, the Act of Parliament is here, and the works have been carried out under the powers of that Act.

4196. Have you a surveyor in the borough?—I do not know that we have, we have an officer who is paid by the borough as a surveyor; he is a gentleman whom we generally employ as our surveyor.

4197. Is there any person who will describe the character of those works, or will you undertake to describe what the character of them is?—No, I cannot do that. I have directed that the plans shall be produced; a plan of the sewerage, a plan of the town, and a plan of the water supply to the town.

4198. Those works were devised, I assume, for the purpose of purifying to some degree the river Lee?—Yes, and they have produced that effect most completely.

4199. Is the sewage treated chemically so as to cause a deposit of any solids, or is it applied to land for irrigation purposes?—I believe, although I do not speak from any scientific knowledge of the matter, that the sewage passes into deodorizing beds, between Hertford and Ware, and then the liquid part of it finds its way back again into the Lee, after going through the disinfecting beds.

4200. The liquid is not passed over land for irrigation?—I think not; but as to the effect of this system of diverting the sewage, I may say that the water after it passes through the town is now in a very pure state. A few months ago the corporation thought it right to analyse the waters from three different parts of the town, from the new waterworks, from the centre of the town, the hydrants, and also from the place which we call the old waterworks, which is the water after it has passed through the town. Professor Taylor, whose report will be laid before you, has analysed those three or four different portions of water, and he gives a most favourable account; the water at the old waterworks after it passes through the town is said to be, I think, as good as any water need be for a town, and that is from the river Lee itself.

4201. Have you an analysis of the effluent water that flows from the sewage tanks?—No, that does not affect us at all.

4202. Do you know anything of the sanitary arrangements of the borough?—I have directed the sanitary inspector and the superintendent of our waterworks to be here, if you think proper to examine him.

4203. Will they speak to the number of water-closets in use, or can you furnish us with that information?—I think it is very likely that our sanitary inspector can give you very satisfactory evidence on that point.

4204. Have you a public water supply in Hertford?—Yes, we have two.

4205. Do they belong to companies?—No, they are the property of the corporation. The whole supply used to come from the waterworks on the Lee, but a few years ago new waterworks were established above those, and the water is now taken principally from a well in Hartam; it is pumped up by machinery and supplied to the town.

4206. That is delivered under pressure?—Yes, there is a reservoir at the top of Port Hill, near Bengeo, to the north of the town; that is supplied from the waterworks; the water is raised to a reservoir on the top of the hill, and that is the source from which the town is supplied at high pressure.

4207. Do the corporation supply all the houses within the town, or have any parties got private wells and pumps?—There are a great many private wells and pumps in the town, but the water is supplied to those who will take it and pay for it.

4208. The waterworks are the private property of the corporation?—Yes.

4209. They are held in trust for the public. Do

HERTFORD.

W. M. Armstrong, Esq.

19 Dec. 1866.

you devote the income to any public purpose if you have a surplus?—At present we are not in that situation.

4210. Did you borrow the money for the construction of those works?—Yes, 3,000*l.*

4211. Are you paying the working expenses and the interest of that borrowed money?—Yes; I think we are about clearing ourselves now, but I am not prepared to answer that question exactly.

4212. Have you any class of nuisances to complain of here, proceeding from any trades or other causes, whatever they may be, locally?—I think that Hertford is peculiarly free from such nuisances now; at the same time we have had considerable complaints with reference to the nuisance arising from the effluvia escaping from the man-holes of the large drains constructed by the New River Company, and that is not cured at present.

4213. Are those drains intercepting drains to take away the sewage?—Yes, those are the large drains that I have spoken to you about, constructed by the New River Company.

4214. You think that the drains are not sufficiently ventilated to carry off the effluvium and prevent the nuisance?—At the present time there is a nuisance which springs from the man-holes or some openings into those sewers.

4215. Have you made any remonstrance to the New River Company?—Yes. The town clerk has been in communication with the New River authorities for some time, and the opinion of counsel has bees taken upon it, which leads us to think that it will be remedied.

4216. Does the river Lee or do any of the tributaries of that river overflow occasionally so as to flood any land?—We have had floods occasionally, but not very lately.

4217. Has there been anything done to decrease the flooding by embankments, or any other improvements in the cuts of the river Lee?—Some few years ago a great improvement was made in the town by the enlargement of the waterway at Cowbridge, and the improvement of the bridge there, I believe, has had a very good effect in preventing the occurrence of floods.

4218. Is the river Lee ever the cause of nuisance in dry weather, or its tributaries?—Not that I am aware of.

4219. Not here?—Certainly not. The water of the river Lee has been analysed after it has passed through the town, and before it passes through the deodorizing works.

4220. Do you know what sources of pollution there are above your town on the Lee and its tributaries?—I cannot speak to that.

4221–2. Do you know that all the sewage of Luton passes in from a population of 20,000?—If it does it is effectually dissipated before it comes to Hertford.

4223. With regard to Luton, you would get anything that comes from there?—If it gets into the river there it does not come here; the river itself is pure now at Hertford; that is proved by the analysis of Professor Taylor.

4224. Is there any sheep-washing in the Lee?—Not within the borough, and I am not aware of any out of the borough.

4225. Evidence has been given that there is sheep-washing in the different tributaries, and that the arsenic used in dressing them is so powerful as to kill the fish to a great extent?—It is quite unknown to us here.

4226. And that a considerable weight of poison passes into the river at Luton which is used in dyeing and bleaching straw plait, and oxalic acid, and different other poisons?—Indeed.

4227. (*Mr. Harrison.*) Who obtained the Act of Parliament under which your town is sewered?—The New River Company.

4228. What was the benefit which the New River Company expected to obtain by carrying out sewerage works for the town?—I think you will get that evidence better from others than myself. I suppose it was with the view of purifying the water that they took from the Lee.

4229. Are they bound by their Act to maintain the sewers that they put down and to ventilate them?—I do not know that there is anything about ventilation specially provided for, but the Act itself is here (*handing in the same*).

4230. The oil mills and the corn mills which you mentioned create no nuisance?—There are two mills, one is above the town, and the other is below the town. I do not myself know exactly what the sewerage of those mills is, but the gentlemen or the owners of those mills will be here.

4231. You are not aware of any nuisance arising from them?—Not to the town. I believe that the sewage from the second mill called, "Baker's Mill," goes into the Lee, but I am not sure of that.

4232. What do you mean by sewage in that case?—What proceeds from the waterclosets, or filth generally.

4233. Not anything properly connected with the mill itself?—I am not able to answer those questions.

4234. Is there any manufacture carried on in the town at all from which pollution arises?—None that I know of. There are only two mills in the town, flour mills, and those two large establishments I have mentioned.

4235. (*Professor Way.*) You say that you cannot answer questions as to those other mills; are they linseed oil mills?—Yes.

4236. You are sufficiently acquainted with them, I suppose, to know that there are only two products from them, namely the oil and the cake?—Yes.

4237. And that there is really no waste?—I am not aware of any waste from those mills that goes into the Lee.

4238. You spoke of Professor Taylor's analyses; those were waters taken at three different places?—I think four different samples were sent to him.

4239. Were any instructions sent with them?—Yes.

4240. Was Professor Taylor's opinion asked on the general question, or as to the analyses of those samples only?—We sent up four samples of water from four different parts of the town, and requested him to analyse those four separate samples of water. He sent down a most careful analysis and a general description of the water. It is more than a mere analysis; it is a report, in fact, on the water supply of Hertford.

4241. I suppose the quantity of water which comes down the Lee to Hertford is very considerable?—Yes.

4242. What distance is Luton from Hertford?—It is about 22 miles.

4243. (*Chairman.*) By the windings of the river it is I suppose considerably more?—Yes.

4244. (*Professor Way.*) It is not very rapid, is it?—I cannot answer that question; in flood times it is.

4245. Still the distance between the two places would afford an opportunity for the stream to deposit anything that was in it?—I am satisfied that anything which enters the river at Luton of a deleterious nature does not come to Hertford.

4246. The distance being considerable the solid matter might be deposited?—Yes.

4247. I suppose that matters in solution are not really precipitated in that way?—I am not scientific enough to be able to answer that question.

4248. You have heard, no doubt, that the poisonous characters of the water are not referable to the large quantity of matter in the water, but to the very small portions of poisonous material which may exist, and which I believe are almost beyond the reach of chemical analysis?—If that is so, I suppose that it cannot be ascertained very easily.

4249. (*Chairman.*) Have you anything further to add?—No.

The witness withdrew.

Mr. Matthew Skinner Longmore (Hertford) examined.

4250. (*Chairman.*) How long have you acted as town clerk to the borough?—I was appointed town clerk last August. I had acted for my father, who was town clerk for 37 years, before. I had been in the habit of acting with him for at least 10 years.

4251. Have you known the town for the whole of that time?—Yes, I was born here.

4252. Are you a solicitor?—Yes.

4253. Have you an intimate knowledge of the Lee as it comes down and goes beyond the borough?—Yes.

4254. Can you describe the condition of the Lee when you first knew it as compared with its condition now; is it different?—I should say not; I mean in its course.

4255. Do you know whether the population has increased in the upper parts of the Lee beyond your borough?—No, I do not.

4256. You do not know that Luton has grown up considerably?—Yes, I know that.

4257. And that other places also have increased in population?—Yes.

4258. Some arrangement was made in 1854, I believe, by which your sewage was diverted from the Lee?—Yes, an Act of Parliament was obtained by the New River Company for that purpose, the Act of 1854.

4259. Was an arrangement made by the corporation with the New River Company to obtain that Act?—No, the corporation watched the bill, and of course took care that their privileges were maintained; and certain clauses were inserted in the bill by the wish of the corporation, but the Act was sought for by the New River Company.

4260. Before the Act was obtained did the entire sewage of Hertford pass direct into the Lee?—I should say a very large part of it did, but not the whole.

4261. This Act was obtained and works were carried out for the purpose of diverting that sewage?—Yes.

4262. Do they carry it down to the disinfecting works and disinfect it?—Quite so. Under this Act, after the New River Company had diverted the sewage, persons had a right to drain into the sewers, surveyors and private individuals; if they do not so they are liable to penalties after the company have diverted their drainage.

4263. There are penalties which prevent them from communicating directly with the Lee, but which compel them to drain into the sewers which are provided?—Yes.

4264. So that the sewage shall be treated before it goes into the Lee?—Yes.

4265. Have you waterworks?—Yes.

4266. Have you any plan of those waterworks?—Yes. I should say that these waterworks are the property of the corporation; they were erected by the corporation, and are worked by steam power.

4267. At what date were they established?—In 1863.

4268. Who was the engineer?—Mr. Gravatt.

4269. Were they constructed under the powers of an Act of Parliament or under your local powers?—The land upon which the engine-house is built and upon which the reservoir is placed was purchased by the corporation with the sanction of the Lords of the Treasury. The money was borrowed with the sanction of the Lords of the Treasury, and is payable off by annual instalments in, I think, 30 years, on mortgage of the borough fund.

4270. Was the money raised under the Municipal Corporations Mortgaging Act?—Yes, under the Municipal Corporations Act.

4271. There is an Act which enables the Lords of the Treasury to sanction the borrowing of money for special purposes which are to be named?—Yes.

4272. Did they send down any surveyor to make an inspection and report before they sanctioned the loan?—No. I think there was a counter-memorial presented from the ratepayers, and the Treasury sent down to the corporation the statements urged by the counter-memorialists with specific questions upon the matter. I think Mr. Ranger was sent down, and he made a report.

4273. Those works are now in successful operation?—Yes.

4274. Have you compulsory powers by which you can compel persons to take your water if you can supply it to them?—No. The arrangement is that the water is let to certain people by the corporation at so much rent per annum; it is regulated mainly by the rents of their houses, but I should say that under the last Sanitary Act that was passed last year there are powers enabling you to compel persons to supply themselves with water for sanitary purposes in case you can show that there is no water upon the property, but of course that would not enable us to compel them to take our particular water; but merely to supply themselves with water for sanitary purposes.

4275. Have you any written analysis of the water?—Yes. I will hand in Dr. Taylor's report (*handing in the same, which will be found printed at the end of the evidence of the witness*).

4276. (*Professor Way.*) Have you a copy of the letter that accompanied the samples sent to Professor Taylor?—I think I can find it. Speaking from recollection, the letter generally asked him to analyse the properties and qualities of the waters, but there was nothing said to Dr. Taylor in reference to any sewage that might empty itself into the water a distance from the town.

4277. (*Chairman.*) The paper which you have handed in contains an elaborate report and analysis of four samples of water from Hertford, and also a report of a chemical and microscopical examination of the vegetable substance contained in the water from the reservoir of the new works?—Yes.

4278. Had that vegetable substance caused any inconvenience in the reservoir to your knowledge?—No.

4279. Why was it submitted for special examination?—I think it was at the time when cholera was prevalent, and it was thought desirable that the water in the reservoir and the river Lee and from the hydrants should be subjected to a chemical analysis.

4280. Is your reservoir an open one?—Yes.

4281. Is it at a sufficient elevation to give you pressure?—Yes, considerable pressure.

4282. What is its size?—I do not know.

4283. Being an open reservoir, I assume that during summer a quantity of vegetation gets into the water, which you thought might be the occasion of mischief, and therefore you had it specially analysed?—Decidedly.

4284. Is this a plan of the waterworks that I have before me?—Yes.

4285. Is the service reservoir at Mole Wood?—No, it is on Port Hill.

4286. What is the well sunk into, is it chalk?—It is gravel.

4287. To what depth is it sunk?—About 15 feet, I am told.

4288. Have you acted at all under the Nuisance Removal Act?—Yes, ever since it was passed.

4289. Have you an inspector of nuisances?—Yes.

4290. Did you hear what the mayor said as to the defective ventilation of the sewers which had been made by the New River Company?—Yes, there is defective ventilation there from the man-holes, they are open. The kind of traps in the street under which the sewers pass are certainly considered offensive in hot weather. I drew the attention of the authorities of the New River Company to the subject, and certainly I consider that under their Act they are liable to keep the sewage free from that nuisance.

4291. Did you on behalf of the corporation ask them to close those openings?—No, I did not ask them to adopt any particular means of abating the nuisance.

HERTFORD.

Mr. M. S. Longmore.

19 Dec. 1866.

4292. (*Mr. Harrison.*) The New River Company were empowered by the Act to make some main drains through the town ?—Yes.

4293. Leaving it to the corporation, through their surveyor, to make the branch drains ?—No, they made the branch drains where persons had, up to the time of the passing of the Act, drained into the Lee ; they made all the drainage complete, the branch as well as the main drains.

4294. Clause 28 says, "That from and after the "making and the completion of the several new "sewers and drains herein-before described in the "said parishes," &c., "it shall be lawful for all per- "sons resident in the said several parishes and places "to drain their houses and premises, and for all sur- "veyors and others having the superintendence of "the public streets, courts, lanes, and highways "in the said several parishes," &c., "to drain "the same by means of the sewers and drains by "this Act authorized to be made, and from time "to time to make such openings and communications "into the said intended sewers or drains as shall be "necessary for that purpose" ?—Yes, that is for after purposes.

4295. Has the corporation carried out any of those branch drains ?—No, but private individuals have to a considerable extent.

4296. Have none been carried out by the surveyor ? —In some of the parishes the surveyors have done it.

4297. In forming those branch drains has sufficient attention been paid to ventilation?—I think so.

4298. Are there openings from them ?—In some of them, but I am not quite certain about it.

4299. If there are branch drains formed and not ventilated you force all the foul gases to come out of the openings which have been formed by the New River Company in the main drains.—The 29th clause is in these terms : "That from and after the making "and completion of the several new sewers and drains "herein-before described in the several parishes," &c., "it shall be lawful for the company to enter upon "any house, buildings, and premises to collect and "intercept all sewage water from all sewers or "drains leading from houses, streets, or other pre- "mises in the said several parishes or places of "Bengeo," &c., "and which now discharge into the "river Lee or other streams leading into the same, "and to divert the said sewage water into the sewers "and drains by this Act authorized to be made in the "said several parishes and places by means of proper "and sufficient culverts or drains, to be made by "and at the expense of the company from the said "existing sewers of the said houses and streets," &c. That was a clause to intercept all the existing drains and sewers ?—Yes.

4300. And permission was given by the 28th clause for any new sewers to be made and to be connected ? —Yes, we are obliged to give the parties 24 hours notice.

4301. (*Chairman.*) Do you know whether those main sewers have required flushing or cleansing by hand since they were made ?—Yes, certainly.

4302. Is that done by the servants of the company ? —We have done them to a considerable extent.

4303. Your men, I suppose, enter by man-holes, and cleanse those sewers out occasionally ?—I think not ; it has been done by the water of the town.

4304. Have you had any complaint made since the outlet works were established as to any nuisance arising from the water or from the sediment taken out of those tanks ?—I have heard of a complaint, but nothing decided ; I have heard a rumour of it. I will now hand in the plans of the sewerage works which have been made by the New River Company (*handing in the same*).

4305. (*Mr. Harrison.*) Do the New River Company keep the sewers which they have constructed under this Act in repair ?—Yes.

4306. Under which clause are they bound to do so ? —Under clause 4. I consider that as they have constructed the works they are liable to maintain them.

4307. Under one clause there is special provision made in the case of one sewer in the Ware district ; it says it shall be made and at all times be maintained and kept in good repair ?—Yes.

4308. The other clause says, they "may" make and maintain, but there is no clause saying that they "shall," except in that special case ?—No ; but I contend that if they have made the works they must maintain them.

4309. The Lee is navigable to Hertford ?—Yes.

4310. Is it navigable beyond at all ?—I think not.

4311. How long has it been navigable to Hertford ? —I cannot tell you that, but beyond my memory it was navigable, I believe, in 1570.

4312. Do you consider that the navigation is of importance to the borough of Hertford ?—Yes.

4313. Do you find that it is useful and advantageous in competition with the railways ?—I think it is.

4314. Is there much traffic upon it ?—Yes, a considerable traffic.

4315. What has been the effect of the construction of the railways, having two different systems, with respect to the price at which you can obtain coals ?— Coals are considerably cheaper than they were in consequence of the competition, but they are not very cheap now.

4316. Are coals brought by means of the navigation to any extent ?—Yes, I should say they are.

4317. You think that the competition of the three systems, namely, the two railways and the navigation, is a benefit in that way to the town ?—Certainly.

4318. If the navigation were done away with you would suffer from it ?—I think so.

4319. (*Professor Way.*) Have you read this report of Professor Taylor's ?—Yes.

4320. Do you remember generally what the conclusions at which he arrived were ; there were four samples of water sent to him, and he finishes with a conclusion. Do you remember generally what it was ? —Yes.

4321. Two of the samples were taken from the new works, one from the old waterworks, and one from the river Lee ?—Yes.

4322. I was under the impression that these waters were taken from different parts of the Lee passing through the town ?

(*The Mayor.*) No, only one was taken from the Lee below the town.

4323. At the old waterworks ?

(*The Mayor.*) Yes ; although it is nearly the centre of the town it is below where the drainage of the town would be.

4324. You will observe that he speaks of the samples as generally good and wholesome water, fit and proper for the supply of the town for drinking and ordinary domestic purposes. He then describes three of the samples, and finishes with a sample which he calls letter "A," and which sample is taken from the Lee ?—Yes.

4325. Does that convey to you the impression that that water of the Lee contains something different from the water pumped from the other sources ?—Yes, it does certainly.

4326. Leaving out the question as to how far that impurity goes, which he says is small, does that impress you with the notion that some kind of impurity of an organic character is contained in that water ? —It might be so.

4327. Is not that what Professor Taylor says ?— Yes.

4328. So far we may say that the water of the Lee is not absolutely a pure water ?—I admit that there is some difference, certainly.

The witness withdrew.

REPORT (referred to supra, Question 4275) OF ANALYSES OF FOUR SAMPLES OF WATER FROM HERTFORD.

HERTFORD.

Mr. M. S. Longmore.

19 Dec. 1866.

The waters were delivered to me on Thursday, August 16th, 1866, by superintendent Jarrett. I was informed that they had been taken from their respective sources on the previous day. They were contained in stone-ware gallon bottles well secured, properly sealed, and labelled. The examination of these samples was commenced on Friday August 17th. The four samples were numbered by me for the convenience of reference; they were as follows:—

No. 1. From the well at new waterworks.

No. 2. From the reservoir of the new waterworks.

No. 3. From hydrant in the street.

Letter A. From the river Lee at the old waterworks, Hertford.

Physical Properties.

The four samples were clear and bright, they contained no mechanical impurity, and deposited no appreciable amount of sediment on standing 48 hours. They had no smell upon opening the bottles, and no effluvia or gas escaped. When the waters were examined in tall jars Nos. 1 and 3 were colourless, but No. 2 and A presented a slightly yellowish colour, such as is sometimes produced by the presence of a small quantity of iron. They were all tasteless excepting A in which a slight taste was perceptible, such as might be produced by the accident of decayed leaves or grass getting into the water. The samples were aerated in about the same degree as good spring or river water; they contained free carbonic acid, and the ordinary elements of the atmosphere, namely, oxygen and nitrogen.

Chemical Constitution.

The usual chemical tests and processes applied to the four waters, showed that they contained only the saline compounds commonly found in good river and spring water, and in about the ordinary proportions. The principal ingredient was the carbonate of lime (chalk) with small quantities of sulphate of lime and chloride of sodium, and with still smaller quantities of magnesia, potash, oxide of iron, and silica. The sulphate of lime was in larger proportion in Nos. 1 and 3 than in No. 2 and A, and the quantity of lime deposited from Nos. 1, 2, and 3 was somewhat larger than that deposited from A. No. 2 and A produced with pure alumina a slightly coloured deposit, (oxide of iron), while in Nos. 1 and 3 the deposit was of a pure white. The four samples were especially tested for oxidizable or decaying organic matter, and for those gases which are imparted by leakage of coal, gas, sewage, or other offensive matters of a like nature. The result was that none of them contained any matters noxious to health. It should be observed, however, that in No. 2 and A the presence of some oxidizable substance was indicated by the test, (permanganate of potash) after the lapse of a few hours, and at the same time there was no such indication in the waters Nos. 1 and 3.

On boiling the four waters the carbonic acid which they contained was expelled, and after a time they become slightly, but in an equal degree, milky-looking from the separation of carbonate of lime. This is the special character of all spring waters which contain the carbonate of lime dissolved. No offensive effluvia were given off during the process of boiling, and the waters when filtered from the calcareous deposit were quite clear and considerably reduced in their degree of hardness.

Portion of Nos. 3 and A were distilled, and the distilled liquids obtained from them were further examined for any volatile matters which might have escaped detection in the entire water. In the distilled liquids of these two samples there was a trace of ammonia, but no volatile matter of an oxidizable nature or in a state of decay.

By evaporation of the waters, a solid chalky-looking and dry substance was obtained from each sample calculated for the imperial gallon of 70,000 grains; the weight of the dry residue in grains obtained from each sample was respectively in No. 1, 14·4 grains; No. 2, 20 grains; No. 3, 19·2 grains; Letter A, 14 grains.

These results show that the samples contain only the average weight of solid matter which is usually found in good river and spring water. No. 1 and A are almost identical, and the same may be said of Nos. 2 and 3. The differences between these last-mentioned samples (2 and 3) and No. 1 probably depend on local circumstances connected with storage and distribution.

The dry residue of each water was nearly white or of a greyish white colour. They were all darkened when heated to low redness, a fact showing the presence of some organic matter, and there was evolved from each a smell resembling that of burnt vegetable matter. The blackening of the dry residue by heat was most marked in A. None of the residues underwent fusion or gave off acid vapours. All evolved traces of the alkaline vapour, ammonia, showing the presence of nitrogen in the organic matter; there were also traces of sulphur, but the presence of this element was most marked in 2 and A. The residues contained in a concentrated form the salts found in the entire waters, but in addition alkaline nitrates were found in the residues of Nos. 2 and 3 and of A; in Nos. 2 and 3 these were less than in the water A. In operating upon a similar quantity of No. 1 no nitrates could be detected.

The proportions by weight of the mineral or fixed matter and of the organic and volatile matter contained in an imperial gallon, or 70,000 grains of each water may be thus stated for each sample:—

No. 1. Water from the Well New Works.

	Grains.
Mineral or fixed matter, chiefly carbonate of lime, with small quantities of sulphate of lime and chloride of sodium - - - - -	12·0
Organic matter and matter volatile at a red heat	2·4
Total weight in grains in imperial gallon -	14·4

No. 2. Water from the Reservoir New Works.

	Grains.
Mineral matter, as in No. 1, with traces of alkaline nitrates - - - - -	16·8
Organic matter containing nitrogen and sulphur, and matter volatile at a red heat - -	3·2
Total weight in grains in imperial gallon -	20·0

No. 3. Water from Street Hydrant.

	Grains.
Mineral matter, as in Nos. 1 and 2, but with more alkaline nitrates than in No. 2 - -	16·0
Organic matter with nitrogen and sulphur and matter volatile at a red heat - - -	3·2
Total weight in grains in imperial gallon -	19·2

Letter A. Water of River Lee Old Works.

	Grains.
Mineral matter, as in Nos. 1 and 2, with alkaline nitrates as in No. 3 - - - -	12
Organic matter with nitrogen and sulphur, and matter volatile at a red heat - - -	2
Total weight in grains in imperial gallon -	14

The hardness of these waters was determined by a solution of soap in alcohol, compared with an equal volume of distilled or pure water as unity; the relative hardness in degrees may be thus represented both before and after boiling:—

	No. 1.	No. 2.	No. 3.	Letter A.
Before boiling	10°	10°	11°	11°
After boiling			6·3	6°

Thus it would require eleven times as much soap to give a lather or detergency to water in a gallon of No. 3 or A before boiling as would be required to produce a similar lather or detergency in a gallon of pure or distilled water. A gallon of the boiled water of No. 3 or A would require six times as much soap as a gallon of absolutely pure water. This shows that the waters lose one-half of their hardness as a result of boiling. On Dr. Clark's scale of degrees the figures would be higher, but the proportions would remain the same.

Conclusion.

The result of this analysis shows that the four samples of water are good, wholesome, and fit and proper for the supply of the town for drinking and ordinary domestic purposes. Compared with the lake waters of Scotland, Cumberland, or Wales, they would be regarded as hard, but the hardness is not greater than that of river waters supplied to the metropolis and to the southern districts of England. The hardness is of a temporary kind, and is reduced to nearly one-half as the result of boiling. The hardness as it exists in these waters affects the question of economy in the use of soap for washing, it is not of that degree to render them unwholesome or unfit for drinking. Besides it must be remembered that the disadvantage of hardness is in a great measure compensated in a sanitary point of view, by the fact that as a rule waters of this composition do not exert any chemical action on metallic lead either in pipes or cisterns, and thus they are not liable to occasion lead-poisoning like waters which contain less saline matter and are therefore much softer.

The differences among these four samples are in a practical point of view so slight as not in any way to affect their qualities for domestic use or their wholesomeness for drinking.

Among the four samples, No. 1, by reason of the small proportion of saline matter in the gallon, and from its

entire freedom from the oxidized products of organic matter (alkaline nitrates) takes the first place. It has evidently not been exposed to any source of contamination. Of Nos. 2 and 3; it may be observed that although they have a constitution similar to No. 1, they acquire from some source small quantities of mineral and organic substances which add to the proportion of solid contents after the water has issued from the well.

Of the letter A or Lee River water it may be said that its composition is very similar to that of No. 1, but it is inferior to it in these respects, the organic matter contains sulphur and nitrogen, and the mineral matter alkaline nitrates, showing that, as a result of exposure, this water has acquired nitrogenous organic matter, which by conversion into ammonia and subsequent oxidation has produced nitric acid. The nitrates are, however, so small in quantity as not seriously to affect the water for drinking purposes; the nitrates are generally found in river water in inhabited districts but commonly only in traces.

15, St. James' Terrace, Regent's Park,
August 24, 1866.

Report (referred to supra, Question 4275) of a Chemical and Microscopical Examination of a Vegetable Substance from the Reservoir of the New Works.

This substance was handed to me for examination by superintendent Jarrett at the same time with four samples of water, on which I have already reported. I was informed by him that it was taken from the banks or side of the reservoir.

It consisted chiefly of filaments of confervæ and other minute fresh water plants forming a kind of net work or sponge, partly bleached by exposure to light, and partly retaining its green colour. It was mixed with a quantity of mineral matter. This consisted in part of sand and earthy substances, and in part of the skeletons or mineral cases of numerous varieties of infusorial animals. The substance also contained a certain amount of moisture which it retained owing to its spongy texture.

It was submitted to a chemical analysis, and it was found to be thus constituted:—

Organic matter, filaments of fresh water algæ - -	31·4
Mineral matter consisting of silica, carbonate of lime, and alumina - - - - - -	40·0
Water or moisture driven off at a heat of 212° -	28·6
	100

A microscopical examination showed that the filaments were chiefly those of the *confervæ glomerata*, having a diameter of about the 1,500th of an inch. When the dry substance was heated a large quantity of ammonia and sulphur were evolved, and very offensive effluvia escaped. A grey ash remained after perfect combustion, which consisted of the mineral substances above mentioned, mixed with some oxide of iron. The dust shaken from the vegetable substance, when examined microscopically, consisted of dead navicula and other infusorial animalcula.

These confervoid substances are produced in all water at the expense of the elements of the air and water, whenever the water is *exposed to light*, and is at the same time stagnant. They can only grow in water if exposed to air; on the bank they wither and decay, they are also liable to decay in water, and thus affect it in variable degrees.

The chemical differences between No. 1, the well water, and No. 2, the reservoir water, appear to depend on the well water acquiring an impregnation or an addition of mineral and organic matter in the reservoir in which it is stored. This addition of foreign matter is not such in quantity or quality as at present to affect the properties of the water; but it would be desirable to preserve the water before distribution as far as possible in the state in which it is procured from the well. The free production of confervæ diatoniaceæ and other fresh water plants, leads in all cases to the formation of a thick, green scum which is liable to decay in hot weather, and as the plants contain a large amount of sulphur and nitrogen, these elements or their products are liable to be transferred to the water, and thus render it less pure. This growth of conferveæ was one of the main causes of contamination of the water supplied to London before the Act of 1851. The reservoirs were open, exposed to light and to the reception of all atmospheric impurities. The Act required all reservoirs for the storage of water within seven miles of St. Paul's should be *covered over*. This has been attended with a material improvement in the water. The confervoid plants do not grow, or only to a slight extent, and the water is kept freely aerated by doors at the side of the covering roof.

There is another fact which requires to be pointed out. Whenever these fresh water plants grow in the water of reservoirs, infusorial animals appear in myriads. These are also subject to death and decomposition, and they thus become an element in adding to the impurities of the water. The confervæ are the food of these animals, and the prevention of their vegetable growths operates to prevent the production of these low forms of animal life.

I would therefore beg leave to suggest that the reservoir from which No. 2 has been taken should be *covered* or *domed over* like the reservoirs of London, taking care at the same time that there is free ventilation. This plan would, I believe, have the good effect of preserving the water No. 2, and keeping it in the state in which it is received (as No. 1) *i. e.* free from any additional source of animal or vegetable impurity. With regard to mineral matter, this is sometimes acquired by water from the cement or materials of which a reservoir is constructed. After a time, however, this source of impurity ceases.

When we speak of impurities in water, we must remember that no water which has once touched the earth can ever be found *pure* or entirely free from the salts of lime, or soda, or from organic matter. The purest lake water in the world, that of Loch Katrine, contains organic matter. I have had opportunities of examining water from the Geyser springs of Iceland in the north to the Yara Yara river in South Australia, and from Vancouvers Island on the western coast of North America to the river Jordan in Syria, and I never found any sample without mineral and organic matter. It is desirable, however, when water is selected for drinking purposes, that we should, as far as possible, avoid adding to the quantity of foreign matter already existing in it. River water is necessarily exposed to light and air, and is liable to suffer damage from drainage as well as from the growth and decay of vegetables upon the banks. Good spring or well water when once obtained is not liable to these accidental causes of contamination, and, when once received in a reservoir, it may by attention to certain points be distributed in as pure a state as it is at the source.

15, St. James' Terrace, Regent's Park,
August 24, 1866.

Mr. J. Marchant, jun.

Mr. John Marchant, jun. (Hertford), examined.

4329. (*Chairman.*) Are you clerk to the River Lee Trust?—I am.

4330. Will you kindly explain to the Commission what the statutory powers of the Trust are?—Yes. I have drawn out a short statement, a sort of historical statement of the constitution and powers of the Trust, which I will refer to, and then hand in. (*The witness subsequently handed in a Paper, which will be found printed at the end of his evidence.*) The navigation of the river Lee is managed and governed by a public Trust, incorporated by the name of "The Trustees of the River Lee." They derive their powers from various Acts of Parliament, the earliest of which were passed in the reign of Henry 6th. The first Act, cap. 5, was passed in the third year of his reign, 1424, and the second, cap. 9, in the ninth year of the same reign 1430. Those two statutes empowered the Chancellor for the time being to issue Commissions for the purpose of clearing, scouring, and amending the river "Ley," which in both of them is stated to be "une des grandes rivers" of England. Then I would pass on to the year when the river was rendered navigable.

4331. (*Mr. Harrison.*) Between what points?—In those Acts no points are defined, but in subsequent Acts the navigation is defined from point to point. In the 13th year of the reign of Queen Elizabeth the river appears to have been rendered navigable, and the constitution of the River Lee Trust may be said to have been first established in that reign. In the

13th year of Elizabeth, 1570, an Act was passed, cap. 18, "for the bringing of the river of Lee to the "north side of the city of London." By this Act the Lord Mayor, commonalty, and citizens of London and their successors were authorized to bring the said river of Lee from the town of Ware to the north side of the city of London; and by section 4 it was enacted, "That the said Lord Mayor, commonalty, and citizens "shall have the whole jurisdiction, conservice, rule, "and government, as well as the said new cut river "and ground of each side, as also the royalty of the "fish and fishing of the same, and the profits of the "said ground, soil, and water to them and their "successors for ever." Power was also given by this Act for the punishment of offenders and persons breaking the rules and orders provided for the preservation and maintenance of the said river.

4332. (*Chairman.*) Was the section you have just read enacted for the purposes of the navigation, or for water supply, or both?—For the navigation only.

4333. The navigation and the fishing?—Yes.

4334. (*Mr. Harrison.*) Was power given to them to dredge the river and sell the ballast?—Yes. Then certain trustees were mentioned in that Act and appointed. I then come to an Act passed in the 12th year of the reign of George II., cap. 32, 1739, and certain trustees were added to the corporation.

4335. Had they a joint interest with the corporation?—Yes, they were local individuals. I may mention that there were to be "16 commissioners," who were to act with the corporation, "viz., four "of the city of London, and four of each of the "shires of Essex, Middlesex, and Hertford, having "lands, tenements, or hereditaments of the clear "yearly value of 40 marks, and not being London "traders." The power given to them was, "to "treat, agree, and compound for the scouring, "cleansing, repairing, and keeping of the said river "Lee." In 1739 an Act was passed, the 12th George 2nd, cap. 32, "For ascertaining, preserving, and im- "proving the navigation of the river Lee from the "town of Hertford to the town of Ware, in the "county of Hertford; and for preserving and im- "proving the said river from the said town of Ware "to the new cut or river made by the mayor, com- "monalty, and citizens of London; and for enabling "the governor and company of the New River the "better to supply the cities of London and West- "minster, and the liberties and suburbs thereof, with "good and wholesome water." That is the first mention of a supply of water from the Lee. By this Act the course of the river was defined, and certain persons therein named were appointed for the putting in execution the powers and trusts by them reposed, by virtue of and in pursuance of that Act, for the purposes therein expressed. I may here mention that the body of Trustees consists of the following *ex-officio* members; the Lord Mayor, aldermen, and recorder of the city of London for the time being; the knights of the shire for the county of Middlesex, the members of parliament for the city of Westminster, the knights of the shire for the counties of Essex and Hertford, the members of parliament for the boroughs of Colchester and Hertford; the mayor of Hertford for the time being, and noblemen and gentlemen from time to time elected from the counties of Hertford, Essex, and Middlesex. The governor, deputy-governor, and treasurer of the New River Company for the time being are also *ex-officio* members of the trust.

4336. Does that constitution of the body of Trustees continue to this day?—It does. I then come to another Act which was passed in 1766, in the seventh year of the reign of George the 3rd, cap. 51, for improving the navigation of the river Lee from the town of Hertford to the river Thames; and for extending the said navigation to the floodgates belonging to the Town Mill in the said town of Hertford: that is the extreme limit of the navigation as at present constructed. By this Act the trustees appointed by the 12th George 2nd, cap. 32, together with several other noblemen and gentlemen therein named, were appointed "trustees "for the making, extending, improving, and main- "taining the navigation of the said river Lee from "the floodgates belonging to the Town Mill, in "the town of Hertford, to the river Thames, and "for putting this Act in execution:" and they were empowered to cleanse, scour, deepen, enlarge, or straighten the channel of the river Lee, and to make and maintain the new cuts therein described, and to build the bridges and works therein mentioned. That was the first period of canalizing the river Lee. By this Act the navigation was declared to be a free navigation for all the King's liege people, subject to the payment of such rates and duties which were thereby authorized to be levied. Then I come to another Act passed in 1779, the 19th George 3rd, cap. 58, which was an Act to authorize the raising of certain additional tolls which are mentioned there. Then in the year 1805 an Act was passed, 45th George 3rd, cap. 69, for the better preservation and further improvement of the navigation, defining certain heights of water and giving power to the Trustees to make bye-laws for regulating the lading of barges. It was also provided that no craft should carry more than 40 tons of freight. That provision has since been repealed, and now there is no limit to the tonnage that may be carried; it sometimes exceeds 80 and 90 tons. The next Act was passed in the 13th and 14th years of the reign of Queen Victoria, cap. 109, called "The "Lee Navigation Improvement Act, 1850." The principal objects of this Act were to enable the Trustees further to improve the navigation and dispose of the surplus water. The Trustees were incorporated by the name of "The Trustees of the River Lee," and were empowered to purchase and hold, and sell, demise, and dispose of lands for the purposes of that and the therein recited Acts.

4337. What was the meaning of disposing of the surplus water?—That we may dispose of the water to companies and to individuals for a water supply. I may state here that there is a subsequent Act which vests the surplus water in two companies, namely, the New River Company and the East London Water Company.

4338. Is there any provision under that head of "disposing of the surplus water" for passing the water freely off the land?—No, that Act enables the Trustees to raise funds.

4339. In the Acts which you have mentioned up to the present moment there is no power given to raise money?—Yes; I think there is. Money has been borrowed; there was power to buy land in the Act of the seventh of George III., cap. 51, section 5. The Trustees were empowered to treat and agree with the owners and proprietors of land and property, and they were enabled to pay for that land and property either by way of purchase in a gross sum or by annual payments, and certain annual payments are still made by the trust.

4340. How was the money to be obtained?—The money to be raised was by annuities. The Trustees were enabled to create annuities for the purpose of raising money. Annuities were raised and have since been paid off. In 1850 the Trustees were empowered to raise on mortgage upon the security of the tolls and property of the trust 230,000*l.* Those borrowing powers have been exercised to a certain extent, and the money has been laid out in the improvement of the navigation and renewal of the works.

4341. (*Chairman.*) Is that the most recent Act under the powers of which you are now working?—Yes. There is an Act which has been passed since, the Act of 1855, which transferred the surplus water of the Lee to the two companies, but our own maintenance and working are under the Act of 1850.

4342. (*Chairman.*) The money which has been raised and expended has been raised and expended under the powers of the first of those Acts which you have named?—Yes.

4343. The debt, whatever it may be, is secured by arrangement under that special Act?—Yes. Then I

HERTFORD.

Mr. J. Marchant, jun.

19 Dec. 1866.

come to the Act of 1855, the 18th and 19th of Victoria, cap. 196.

4344. Is that the most recent Act?—Yes. This is called "The River Lee Water Act, 1855." By this Act the surplus water of the Lee over and above the quantity required for the purposes of navigation was vested in those two water companies respectively, subject nevertheless to such rights as might not then belong to the Trustees. The daily quantities of water reserved to the Trustees for navigation purposes and not subject to any control by the water companies are as follows: first, they may pass through their locks from the highest point at which the water companies or either of them take their supply down to and including the first lock above Fielde's Weir (called "The Upper Reach") not exceeding in any 24 hours 576,000 cubic feet per diem.

4345. The companies referred to there being, I assume, the two water companies you have mentioned?—Yes, the New River Company and the East London Water Company. Secondly, they may pass from the first lock above Fielde's Weir exclusive down to and including Waltham Town Lock (called the Middle Reach), not exceeding in any 24 hours 720,000 cubic feet. Thirdly, they may pass from Waltham Town Lock exclusive down to and including Old Ford Lock (called the Lower Reach), not exceeding in any 24 hours 864,000 cubic feet. All water below Tottenham Mill not required by the two water companies at their drawing stations is reserved to the Trustees for navigation purposes. By that same Act the two water companies are strictly forbidden without the consent of the Trustees, at any time to draw from the river so as to reduce the water in any pond of the navigation below the customary head level of that pond.

4346. (*Mr. Harrison.*) That limits your navigation?—Yes, it does, but I believe that limit has never been attained. Below Tottenham Mill the whole of the water belongs to the River Lee Trust. The priorities of rights to take the water of the river Lee are very clearly defined by this Act and are as follows: first, the right of the Trustees to the upper, middle and lower daily quantities, and such further quantity as shall be necessary to maintain the water of the navigation on a level with the head levels aforesaid; secondly, the right of the New River Company to take 2,500 cubic feet a minute; thirdly, the right of the East London Waterworks Company to take 2,500 cubic feet a minute; fourthly, the right of each company to take, *pari passu*, 500 cubic feet a minute; fifthly, the right of each company, after notice, to take, *pari passu*, any additional quantity; sixthly, the right of the Trustees to surplus water below Tottenham Mill.

4347. You have the first claim upon the water up to the limits you have mentioned?—Quite so.

4348. The companies have power to take 2,500 cubic feet per minute at the same time?—Yes.

4349. If there is a surplus beyond what you require and they require, they can each divide it in equal proportions?—Yes.

4350. To any extent that that surplus may be?—Yes.

4351. Below Tottenham you have the entire control of the remaining water, whatever it may be?—Yes, that is so. These Acts which I have cited give the whole jurisdiction, conservancy, and government of the river to the Trustees of the river Lee, and they give them a priority of right to the quantity of water necessary for navigation purposes. That exhausts the constitution and statutory powers of the trust.

4352. (*Chairman.*) What are your executive powers as a trust?—We meet monthly and dispose of all the business which comes before the Trustees; the meetings are, in fact, general meetings; that is to say, all the Trustees receive notice; they are not committee meetings, but we deal with all questions affecting the navigation other than those of nuisance; that is to say, we have not power to deal with nuisances under the Acts.

4353. Where do the meetings take place?—At Hertford during part of the year, and in London during the session of Parliament.

4354. Are the Trustees a paid body?—No, unpaid.

4355. Is there any allowance made for travelling expenses?—None whatever.

4356. Each member of the trust travels to and from each place at his own proper charges?—Quite so.

4357. Do those meetings take place essentially for the purpose of regulating the navigation traffic and business of the river?—Yes, and to receive communications from traders and parties using the navigation.

4358. What is the present debt of the Trustees?—174,287*l.*

4359. You have power to borrow to what amount?—230,000*l.*

4360. You have not borrowed to the maximum that you are authorized by the recent Act to borrow?—Not by a sum of 55,713*l.*

4361. Then the money is borrowed, I suppose, from any individuals who choose to lend it?—Yes.

4362. Have the Trustees borrowed any of it from the Exchequer Loan Commissioners?—No.

4363. Is there any authority in the Act to enable the Exchequer Loan Commissioners to lend money to the Trustees?—I think not.

4364. Upon what terms have you been enabled to borrow that money as to interest, and what is the period allowed for repayment?—At $4\frac{1}{2}$ and 5 per cent., upon terms varying from three to seven years.

4365. You have borrowing powers, and I assume reborrowing powers?—Quite so.

4366. You can pay off and reborrow to replace the the money?—Yes.

4367. Are you bound by the terms of the Act to repay that money, or may it remain a permanent debt?—We are not bound to repay it.

4368. You are not bound, when money is borrowed by the trust for water supply and other purposes, by Act of Parliament to repay it either in 30 or 50 years?—There is no limit in this case.

4369. It is borrowed upon the security of the tolls?—Yes, and other property of the trust.

4370. In the event of railway competition, or any other form of competition, or any alteration in trade, diverting traffic from the river, and reducing the income of the trust, is there any outside security to the lenders of the money?—We possess land and mills, and annuities, secured by Act of Parliament from the water companies.

4371. You have an income from the water companies?—Yes.

4372. I believe the amount was mentioned by your engineer?—Yes, 3,500*l.* I might mention just to qualify your observation, that in 15 years, from tolls alone, we have doubled our income during the period of railway competition, we have annuities secured by the Act, and we have mill property and land; a valuation of that has been made within a recent period, and it is a very large sum indeed; that is over and above the tolls.

4373. You have a profitable trade now, and one that has for many years back been growing?—Yes; this year we shall realize 1,000*l.* upon the river more than at any other period.

4374. I may ask you, perhaps, whether your traffic manager will attend to give evidence?—He will.

4375. He will, perhaps, put in the tonnage carried upon the Lee, showing the rate of increase, and also the income derived from that tonnage?—Yes, he will.

4376. Have the Trustees power to increase the rate of charge over and above what is at present paid, supposing that they resolved to do so, to meet their engagements?—Yes, they can considerably increase it.

4377. At the present time you do not charge the maximum rate that you are empowered to charge?—No; take, for example, these four items, coals, malt, flour, and sundries. Coals may be charged 2*s.* $2\frac{1}{4}$*d.* per ton, whereas we charge 6*d.*; malt may be charged 2*s.* $1\frac{1}{4}$*d.*, whereas we charge 1*s.*; flour may be charged 1*s.* $8\frac{1}{4}$*d.*, whereas we charge 1*s.*; sundries may be charged 1*s.* $9\frac{1}{4}$*d.*, whereas we charge from 1*s.* 3*d.* to

1*s.* 2*d.* We lower our tolls from time to time as the exigencies of trade or our finances admit.

4378. (*Professor Way.*) As a matter of policy?—Yes.

4379. (*Chairman.*) You are able now to offer good security for any money you may wish to borrow to improve your works?—We think so, and with a very considerable margin.

4380. In the event of your continuing to earn a surplus would the Trustees be authorized to pay off any of the mortgage bonds, or would they, instead of that, reduce the rate of tolls?—They have power to do either; they have power legally to pay off the bonds, because some of the debentures are overpaid; some parties prefer the security, and they allow them to remain. The Trustees would probably consider whether it was desirable to pay off some of their debt, or to lower the tolls for the public. As long as the trade remained in an increasing condition I presume they would pay off the mortgages in preference to lowering the tolls.

4381. In the event of the day coming when the trade of the district was found to be so profitable that they could wipe off their mortgage debt altogether, and have the whole income available, except for the payment of the salaries of their officers, does the Act point out any arrangement that might be made?—The navigation would become a free one absolutely.

4382. The tolls would then be reduced to a minimum to provide for the payment of the salaries and so forth?—Yes, there must be some revenue for that purpose, for maintenance and for repairs, but that might be met probably by the payments made by the water companies or by rentals.

4383. Can you explain to the Commission the special circumstances under which this town has been sewered and drained; has it been done by the river Lee Trustees or entirely by the New River Company?—Entirely by the New River Company, and for their own purposes; it was done under a special Act of Parliament obtained by them.

4384. Have the Trustees of the Lee been at all troubled by pollutions caused in the course of the navigation?—Yes.

4385. Have they ample legal powers to deal with parties who cause nuisances?—They have no legal powers other than the common law rights which individuals possess in such cases; they have no statutory powers to deal with nuisances. There is one section in our Act which enables them to inflict penalties upon parties who maliciously cast refuse into the river, building refuse and so on. The words are, "if any person "shall wilfully throw any gravel, ballast, stones, rub-"bish, or dirt" (*reading from the Act to the words*) "not exceeding three months."

4386. What clause do you refer to?—The 109th clause of the 7th George 3rd, chapter 51.

4387. Would the word "intent" in that clause so qualify the intent and meaning of that clause as to render it inoperative?—Perfectly so; I consider that that word "intent" entirely prevents the clause being operative.

4388. If you were to summon a man, would you not have great difficulty in proving what he "intended" to do?—It would be utterly impossible to prove it.

4389. That clause requires amendment, does it not?—Yes; I have never heard of an attempt yet being made to put it in force.

4390. (*Mr. Harrison.*) So far as the clause goes, would not the word "dirt" include sewage?—Yes, I think it might; but then it must be proved that there was a wilful intention on the part of the offender to obstruct and injure the navigation.

4391. (*Chairman.*) If the framers of the clause had been satisfied with saying that proof of having thrown solid refuse into the river should be sufficient, do you think you could have put the Act in force?—Yes.

4392. But when it puts upon you the onus of proving a man's intention it takes away the whole sting of the clause?—It does; the Trustees have very much regretted that they had not the power which the Thames Conservancy are able to exercise. I understand that they have carried those powers into operation—the powers given to them by the last Act of 1854; indeed I know they have, because I have supplied them with evidence, which has enabled them to obtain a conviction.

4393. Might I ask you whether the Trustees have discussed recently the advisability of obtaining additional legal powers similar to those which are embodied in the Conservancy Act of last session for the river Thames?—They have in reference to that and many other objects, and it is thought desirable to obtain powers for the same purpose. The Thames Conservancy, since the passing of their Act of 1864, have taken proceedings in six cases, in which they have obtained convictions under the three-mile clause.

4394. What cases were those?—One was the case of H. Tallerman, who was fined 5*l.*; a man of the name of Stevens was fined 5*l.*; another of the name of Crossley was fined 5*l.*; in the case of Denton and Jutson the case was dismissed on their agreeing to alter their pipes; in the case of Batley and Butler the case was dismissed on their agreeing to alter their pipes; the case of Messrs. Abbott was adjourned till the following Friday to ascertain the result of a wall that was in course of erection. These were cases of nuisances on the Limehouse cut, the refuse being discharged into the river Lee.

4395. Was it solid refuse that was thrown in?—It was refuse from their manufactories, liquids and solids together.

4396. The proceedings in those cases were taken under the Act that was obtained in 1864?—Yes.

4397. Are you acquainted with the clauses generally in the Act passed in the last session for the future government of the Thames?—I have read it.

4398. It gives to the conservators, after notice, power to remove weirs, to take possession of locks, to remove or lower mill dams, and absolutely to prevent the sewage of any town or place from being thrown into the river?—It does.

4399. (*Mr. Harrison.*) Did the cases to which you have referred come under your notice as having a joint interest in Bow Creek with the Thames Conservancy?—Yes, they were our complaints in point of fact. We brought the matters before the conservancy, our officers were directed to give evidence, and convictions were in that way obtained, I think, in all the six cases; they all occurred in our district.

4400. Have they taken any action out of your district that you know of, or do they do so only when a matter is seriously forced upon their attention?—I am not aware.

(*Mr. Beardmore.*) I may be allowed perhaps to say that the Thames Conservators are constantly prosecuting offending parties; not a week passes without that being done.

(*The witness.*) I might mention other cases of nuisance. One or two of these cases we took before the police magistrates ourselves, and in the case of Tallerman we failed because we had not the power which the Thames Conservancy enjoy.

4401. (*Chairman.*) Is that the general character of the nuisances you have to complain of, polluting the waters of the navigation?—Yes; beginning with Ware, and down to the effluence of the Manifold ditch which conducts the water from the sewage works at Hertford, I think I may say that the water is extremely pure, that is to say, I am not speaking chemically, but to all appearance and taste. When we get below Ware lock the first real nuisance commences at the point where the outfall of the sewage water from Hertford takes place, that is the water which is brought there and which has passed through the deodorizing works at Hertford which were constructed by the New River Company.

4402. Do you know sufficient of the character of that effluent water to be able to say whether it has ceased to be the cause of nuisance, and therefore unobjectionable?—I think it is neither one nor the

HERTFORD.

Mr. J. Marchant, jun.

19 Dec. 1866.

other, but I will say this, that it is most undoubtedly to the interest of the navigation that the water should be kept pure; that is necessary for the navigation. There must be a certain amount of solid deposit if you get filthy water, and therefore it will affect our navigation. In course of time it will silt up the bed of the river, and it does do so. We have, in consequence, to spend large sums of money in dredging out the sewage mud which accumulates in the river.

4403. Are you chemist enough to know that no disinfecting process or any treatment of that kind does anything but remove the solids; it does not touch the salts of sewage which are incorporated chemically with the water?—I do not know that of my own knowledge, but that is what I hear.

4404. (*Mr Harrison.*) After undergoing the process of clarification adopted by the New River Company is there any deposit in your navigation from the effluent water from the deodorizing works?—There is certainly an accumulation, whether it is a deposit of solid sewage which has floated down, or sewage in solution, I do not know, but I have observed that there is an accumulation of a black substance occasionally. In passing there you may see floating on the surface what appears to be at first sight floating sewage; it appears like nightsoil, but if you examine it you will find what it is; it is simply a confervoid growth which has risen from the bottom, and which has grown up from the presence of the sewage water. The sewage water seems to have fertilized the bed of the river. I have examined some of these collections and found that they were vegetable, not sewage. I suppose it is nature's method of clarifying the water.

4405. Is the water that is discharged from the works in appearance clear as it passes along and before it reaches the navigation?—I have seen it perfectly clear, and I have seen it also looking somewhat peaty, as though it had passed over peat of a brown colour; I cannot say that at all times, for instance, in hot weather, it is perfectly clear.

4406. Notwithstanding it appears to be quite clear as it passes from the works, when it reaches the navigation there is a deposit of some kind which gives rise to the results you have mentioned?—Yes, there is certainly a discolouration.

4407. After it mixes with the water of the navigation?—Undoubtedly; and I have been told by parties who have complained, that there is absolutely a smell and a great nuisance. We have received complaints from the Ware local board of health upon the subject.

4408. (*Chairman.*) The smell would probably come from two causes; first, the heat of the weather, and, secondly, the length of time during which the sewage has stagnated in the sewers before it got into the open air?—No doubt; we then come within 300 or 500 yards of the main sewer of the town of Ware, which is as abominable as it can possibly be; no attempt is made at deodorization, or any process which shall render it innocuous.

4409. It comes down as it is delivered from the town, does it?—Yes.

4410. Have you given them any notice upon the subject?—We have complained, but I may say that there is a little counter irritation in this case. They send us a complaint as to the Hertford sewage, and then we refer them to the nuisance they create.

4411. (*Professor Way.*) I suppose you have no doubt that the measures taken at Hertford to precipitate the sewage place the river in a better position than it is at Ware?—Yes, certainly.

4412. At Hertford the evil is greatly mitigated?—Yes, the work is done there as well as one could think it possible to do it by the process which they adopt.

4413. (*Mr. Harrison.*) Is any bank formed in the navigation below the point where the Ware sewage is discharged?—Yes, I believe there is one accumulated, and we shall have to incur expense in clearing it away.

4414. Is that an obstruction to the navigation?—It will become such.

4415. Cannot you under your Act proceed against the authorities of Ware on that account?—At that point there is a stream which enters the river, and it flows very rapidly there from the Town Mill of Ware, and the rapidity with which the water comes down clears away the bank, or the accumulations which are continually growing there; now and then there must be large accumulations in the river, but they are distributed over a large area.

4416. You would probably find it difficult to bring the matter home to the authorities of Ware?—Yes.

4417. (*Professor Way.*) And perhaps you could not do so until the evil had been the cause of some damage?—No.

(*Mr. Beardmore.*) I may mention that the river also, besides the millstream, has very large floods constantly coming down, and the mud gets washed away into the general stream; there is a very large amount of mud in the river generally, but not at that point.

4418. (*Chairman to the witness.*) Have you looked with any care at the recent Conservancy Act for the Thames?—Not with any very great care, but I have read it through.

4419. I suppose, if a complaint was made before any properly constituted tribunal that the river Thames was polluted by the river Lee, you could not deny it?—Unquestionably not; our great complaint is that pollution does find its way down our channel, but we have not sufficient power to prevent it.

4420. You might say that you do your best to prevent it, but you must at the same time confess you were guilty of passing the foul water into the Thames?—The fact is that our funds are not applicable to the purpose of preventing it. By their prescriptive rights the parties have been empowered to discharge, and from time immemorial discharges have taken place at different points of the river, and the law will not reach them in its present state unless they cause a nuisance.

4421. I suppose you are aware that if any person suffers from a nuisance caused by pollution from sewage, and he can prove that he suffers from it, the person who causes the nuisance can be indicted?—Quite so.

4422. We have been informed that it is by no means a simple process to obtain an injunction to restrain parties from causing a nuisance?—It is a very expensive and tedious proceeding.

4423. And when you have obtained an injunction you are sometimes no better off than before?—That is frequently the case.

4424. You may be suffering in the river Lee from town sewage, and if you obtain an injunction you may be no better off than you were before?—An injunction may be only partial in its operation, for instance, you might proceed against a board, having certain limits to its jurisdiction, and not extending over the whole area of the nuisance, and you would have to multiply your legal proceedings with very doubtful success.

4425. Are you aware that the river Lee Trustees are not alone liable to these almost futile proceedings, but that the authorities of towns and private individuals stand in the same position?—Quite so.

4426. Suits may be multiplied without any beneficial results being attained?—Yes.

4427. Have you considered the question of the future conservancy of the river Lee, and what form it might take in connexion with your trust?—I have thought a good deal about it, but I do not know whether I ought to express an opinion in the presence of the chairman, who is prepared to speak upon that subject.

4428. Will you then, as far as you can, enumerate the nuisances which exist between Ware and the point at which the East London Water Company take their water?—At Ware there are a great number of privies and drains which lie immediately over the river and which are discharged immediately into it; in a space of only about 200 yards there are a great number, about which we have complained, but we

found that the Local Board of Health were not disposed to act in the matter.

4429. If you summoned those parties before the justices I suppose their advocate would say that they had a prescriptive right?—Yes, and that is the difficulty we have to contend with. The next bad nuisance is at Tottenham; I think there is nothing between Ware and Tottenham of any importance. There is a small amount of drainage from the towns and villages.

4430. (*Mr. Harrison.*) Is the sewage of Hoddesdon carried into the river?—Yes, it is partially.

4431. Between Ware and the point from which the East London Water Company take their water are there any streams or tributaries from which any polluted water is passed into the Lee?—Yes, there is the Stort, and I believe the whole of that is turned into the river Lee.

4432. Do you find in the navigation that the water of the Stort brings down much polluted matter?—It is not observable, and it is not in the form of solids; then there is Waltham Abbey.

4433. (*Chairman.*) Have you any legal power over the navigation of the river Stort?—None whatever.

4434. You have no legal authority to pass along that stream to inspect it and see what they are doing?—No, except as one of the public might, not in any official capacity.

4435. That stream is not under your supervision?—No.

4436. The owners have an independent engineer and an independent board, and I believe it is private property?—I believe so. After we leave Waltham Abbey we reach Enfield lock.

4437. Is there any discharge of sewage at Waltham Abbey which is objectionable?—Yes, it is very bad there.

4438. Then you get to Enfield lock?—Yes.

4439. Is the sewage from Waltham Abbey let into the Lee above the point at which the East London Water Company takes its water?—Yes.

4440. So that any foul matter that comes in there necessarily forms part of the water taken by the East London Water Company?—Certainly. The next place is Enfield lock; the outfall works are in that neighbourhood, and the drainage from that district finds its way into the Lee.

4441. Is there any treatment of the sewage matter by filtration before it gets into the river?—I think not, it is all in the natural state.

4442. Is it above or below the point at which the East London Water Company takes its supply?—Above; then we come below the point of the supply to the East London Water Company below Tottenham lock. There we had first an intercepting drain or outfall, and that was constructed by the East London Water Company in pursuance of an Act that was passed in 1852.

4443. To which I believe you assented?—Yes, we were assenting parties, and for this reason: the sewage before that had found its way into the river Lee, through open ditches and several outfalls that there were into the Lee, in a worse form altogether than that in which it presents itself now. Those ditches were intercepted to enable the East London Water Company to take their supply wholly above Tottenham lock as pure as they could get it, and they passed the intercepted sewage down at the tail of Tottenham lock. I might say that it is not so bad as many I have spoken of, as the sewage is conveyed for some miles in an open drain, and absorption, evaporation, and oxidation have been going on, so that when it arrives at the Lee it is not always very polluting in its character. In hot weather it is so certainly.

4444. (*Mr. Harrison.*) The whole drainage of the land adjoining is intercepted as well as the sewage, is it not?—Yes.

4445. So that the sewage is diluted to a considerable extent?—Yes.

4446. I believe there are some tributaries as well?—Yes, at that point there is a considerable silting up of the bed of the navigation by the effluent water and the matters in solution.

4447. If the sewage matter running down the cut becomes comparatively harmless when it gets to the bottom, what is the effect upon the inhabitants of the district through which it runs?—They complain very much of it. I do not know that there is a very manifest effect produced, but there must be something. Then about a quarter of a mile below the intercepting outfall comes the whole drainage of Tottenham, Wood Green, and West Green.

4448. At Tottenham they profess to disinfect the sewage?—They attempt to do it, but the result, I believe, is utter failure.

4449. Do you think that the process is less effectual than that pursued at Hertford?—Certainly; because the Hertford arrangement is adequate to the volume of the sewage, whereas at Tottenham it is totally inadequate.

4450. You think that they do not take out the amount which they might?—Certainly; not a tenth part of it.

4451. Have you given them any notice that you should interfere with them?—We have filed an information against them in chancery.

4452. There are several places besides the lunatic asylum at Colney Hatch, all of which tend to pollute the Lee at and about Tottenham?—Yes.

4453. I believe that the Tottenham board have either threatened or commenced proceedings against certain parties above them?—Yes, they have attempted to do so. I believe last year they filed a bill against the Hornsey board, but there there is nobody to make amenable; that board is not an enduring body; it is not a corporation.

4454. (*Professor Way.*) The works at Tottenham, I believe, were made 12 years ago?—Yes; rather more.

4455. Has the population of Tottenham increased since that time?—Yes, very largely, but the works have not been increased.

4456. Do you think that that is the cause of their inadequacy?—Yes, I believe that the works have been, although in operation, decreased; that is to say, certain tanks that were in operation originally have been abandoned.

4457. I believe there were certain elevated tanks into which the sewage was lifted, and I think those have been abandoned?—Yes. As I understand the process, it involved the use of those tanks to enable them to deal with a larger volume of sewage than they now deal with.

(*Mr. Beardmore.*) They also had filter-beds in a yard, which have all been filled up.

4458. (*To the witness.*) Was it at the suit of the Trustees of the river Lee that the interim injunction was granted?—Yes; and it was to restrain the authorities of Tottenham from bringing the sewage of Wood Green and West Green into the Lee. The injunction says that they shall not increase the evil until the hearing of the cause.

4459. Was it in consequence of that, that they made cesspools in Wood Green?—I do not know; but I might mention that on the occasion of the last survey of the river, (there is an annual visit paid by the Trustees of the river to inspect the works,) we went to the deodorizing works, and we there saw the pollution passing into the river at Tottenham, below the lock, and the nuisance was then excessive, the sewage was perfectly black and abominable. That was after the institution of our suit.

4460. Have you any control over the drainage of the adjoining lands on either side of the river Lee?—No.

4461. Or any responsibility—for example, if any flooding takes place are you liable for the damage done?—I presume that if damage arose from the want of repairs and the inefficient working of the navigation there probably might be some liability, supposing that the banks were not kept up and made sufficiently strong.

HERTFORD.

Mr. J. Marchant, jun.

19 Dec. 1866.

4462. (*Mr. Harrison.*) Are there any water-marks on your navigation to which you are limited as to the height at which the water is to be kept?—There are marks up to which we are entitled to keep the water for the purposes of the navigation as against other parties, but we are not limited as to any outlay that may be necessary for the preservation of our works; we have proper side weir exits for the water. Then I come to the state of the river from Old Ford to the Thames, which is the tidal portion of the navigation, and that is rendered very pestiferous during hot weather owing to the discharge of impurities from various manufactories and works on the banks of the river there.

4463. Have the Trustees any control over those works either to prevent their establishment or to regulate them when established?—Not unless they interfere with our banks, or they require lay-byes or works and convenience; we have no power if they keep themselves at a distance from our undertaking. We find that they generally come to our banks, and then make application for an agreement for lay-byes or for a supply of water to their engines; then they come under our control in some respects.

4464. Have applications been recently made to you for leave to make wharves for the accommodation of the traffic on the banks of the river in the navigable parts?—Yes, one was made very recently at Ponder's End; large jute works are being erected there.

4465. So that they should be enabled to have their barges come alongside and discharge their loads at the wharves?—Yes, and the agreement is in course of completion. In every case when we enter into an agreement of that kind we invariably insert clauses to restrain parties from casting any pollution into the river; we make that a *sine qua non*, and we will not grant them the facilities they require unless they under take to exclude all sewage and drainage from the navigation.

4466. Have you made any arrangement with any of the boards of health or other authorities, either of London or any of the adjoining parishes in the tidal portions of the river, to prevent sewage passing in?—No.

4467. Is it not the fact that a considerable amount of sewage has been passed in from the London district to the western side?—Yes.

4468. Have you any sewage passing in from any of the areas on the eastern side; I believe there is no sewer?—I think not. Not in the Limehouse Cut, but there is the West Ham sewage which is discharged beyond the Bow Creek entrance. There are two entrances to the river Lee navigation, one *viâ* Bow Creek to Blackwall, and the other from Bromley to Limehouse, near the church, and up the canal which was constructed under the powers of an Act of Parliament.

4469. That, I think, brings you down to the Thames?—Yes. We then come within the district of the Metropolitan Board at Old Ford, and there are outfalls, what they call storm water outlets. Three or four years ago, I think in 1863, the discharge from those outlets was so enormous that the Trustees were compelled to take proceedings, and they filed an information and bill against the Board and they obtained an injunction and 820*l.* in respect of the damage done to the navigation, and the costs of the suit.

4470. The metropolitan board allowed their sewers to discharge at their overflows as you conceived improperly?—Quite so, and the court justified our view of the question.

4471. I assume that having made overflows at those points they would have power to admit the flood water under certain conditions?—Undoubtedly. The injunction that was obtained is permanent, and since then they have constructed their main outlet works at Barking, so that we do not now anticipate such an influx under any conditions as we had then.

4472. Did the nuisance take place previously to the time when they commenced their outlet works at Barking?—Yes.

4473. They had made a temporary outlet then?—Yes.

4474. (*Professor Way.*) Have they not an overflow at Bow Lane?—I think not.

4475. Does Bow Common drain into the Lee?—No.

4476. You know that there are all sorts of disgusting trades carried on there?—It is a nuisance district.

4477. Does it drain into any stream which drains into the Lee?—I would rather that Mr. Beardmore answered that.

(*Mr. Beardmore.*) It was the ancient Tower Hamlets sewer up to about the 13th of August last. It flowed under the river Lee by a pipe, but there was a storm overflow under Bow Common bridge, which I think is what you refer to; if heavy floods of rain came it flowed over into the Lee, but only on those occasions. On or about the 13th of August the metropolitan board commenced pumping temporarily at Abbey Mills from the low-level sewer, and since that date I believe the bulk of the sewage of that sewer has been turned into the low-level sewer, not because it happened to run into the Lee, where it overreached it, but it ran down into Limekiln Dock, and created an abominable nuisance at Limekiln Dock; that nuisance is very much mitigated.

4478. (*Mr. Harrison.*) When was that abominable nuisance which you speak of?—Up to August it had always prevailed.

4479. You know that of your own knowledge?—Yes. Perhaps I may explain that the nuisance of the Tower Hamlets sewer at Limekiln Dock was very much mitigated when the northern high-level sewer was carried to Barking in the summer of 1863, but the sewage has flowed ever since up to very recently, when it was diverted under the circumstances which I have mentioned, and it is now pumped by temporary engines into the high-level sewer, and so to Barking.

4480. (*Professor Way.*) The Penstock Station was the point which I meant.

(*Witness.*) The storm outlets of which I have been speaking are connected with that Penstock Station, and I may say that the repetition of that nuisance is possible, according to the construction of their works.

4481. Because they have a permanent outfall?—Yes.

4482. It could only, I believe, be possible in a very heavy storm?—I believe that to be so because the gates are set at a very great height.

(*Mr. Beardmore.*) Up to August the low part of the Hackney brook came by gates which are shut down. The arrangements are very complicated; it is hardly possible to explain them or to understand them without a plan and section.

(*Witness.*) We have recently had occasion to complain of what we thought was the inflow of a quantity of sewage from those outlets; there was no diminution in their flow at Barking Creek on the day of which we complained. The outlets are probably a quarter of a mile off, that is to say, the entrance into the Lee is a quarter of a mile from Penstock, and their theory is, that this quarter of a mile must from time to time have accumulated animals and refuse, and that when there was a flood of rain in London it ran over the gates, and simply pushed out the impurities which had flowed up these channels by the action of the wind. If that be the case there must be some preventive means; there must be a grating or something of that kind placed at the mouths to prevent its occurring again. The rust shows that the gates have never been touched for two or three years.

4483. (*Mr. Harrison.*) Is the mill property and the land which the navigation Trustees possess a security for the money which you have borrowed?—Certainly, we consider so.

4484. Are you aware that upon the Thames, the Thames Commissioners had land to the value of about 10,000*l.*, which was not considered security for the bondholders?—I conceive that their bond must have

been in a different form. We certainly understand that the whole undertaking is a security for the monies advanced. We have actual power to buy, hold, and dispose of lands.

4485. In the case of the Thames the Commissioners at any rate actually possessed land valued at about 10,000*l.*, which they said was not available for the payment of the bondholders. Your debentures appear to be terminable at short dates?—At periods of three, five, or seven years.

4486. Is that provided for in your Act of Parliament, or is it an arrangement of your own?—It is an arrangement of our own. We are not limited at all as to time.

4487. You might have the money for an unlimited period of time as the bondholders determined?—Quite so, for a shorter or a longer period as circumstances might admit. I am reminded that we have been a corporate body since 1850, under seal, and as such corporation we are able to hold lands and to dispose of them, but the Commissioners of the Thames were never in that position, so that we are superior to that body in that respect as well as in the other respects which I have mentioned.

4488. The money which is annually paid by the water companies to your Trustees is on account of powers given for the abstraction of the water from the river Lee?—Yes.

4489. Besides that have they not power to call upon you to execute works, they paying for them?—They have, for the better storage of the water.

4490. Have they exercised that power?—In one instance; the New River Company called upon us last year to reconstruct the Hertford lock. The reason was that they drew down the water frequently, as we proved by gaugings, considerably below the navigable head; they did so from time to time. We made complaints to them and threatened them with proceedings because our barges ran aground and did not get over the sill at Hertford lock. Then they said, "Well, in order to prevent your having any cause "for complaint we will ask you to rebuild your lock "and to place the sill at a lower level;" and that has been done, and we have had no further complaint from the traders on the navigation.

4491. You have benefited the navigation and you have improved the construction?—Yes, and they have kept up their water very much better since the lock has been lowered than they did previously.

4492. Shall we obtain from your manager information as to the advantage which the navigation is, not only to Hertford but to the whole district through which it passes, or have you any observations to make upon that head?—My own impression is a very strong one, that the navigation is very essential to the towns through which it passes as a highway. I moreover think that the navigation should be maintained in a sanitary point of view, because the form of a river well maintained and in good repair, the river being full and deep, must be better for the health of the districts than a river neglected and simply running as a channel for the passage of water. Barges passing to and fro causing a change of the water from pond to pond, locking every hour, I fancy, must be more beneficial than a river neglected.

4493. Does the navigation afford greater facilities for manufactories upon its banks than can be given by any railway?—Certainly. There are manufactories on the banks which have no other mode of carriage.

4494. Barges upon a navigation can stop at any point?—Yes.

4495. It is not so easy for the trucks to do so upon a railway?—Just so. There are a number of public wharves upon our navigation, and if they were abandoned it would be a very serious loss to the neighbourhood.

4496. (*Chairman.*) Do you charge a toll for carrying manure?—No.

4497. Then I presume that that is an advantage to the landowners and the farmers?—Quite so. Agricultural manure is not charged for, and that alone must be an immense advantage to the Londoners who purchase an enormous quantity.

4498. (*Mr. Harrison.*) Is artificial manure free?—Yes. If you will allow me to refer to the clause in the Act which exempts those articles you will see what is included. It is the seventh of George III., chapter 51, section 81, "Provided always, that no tonnage "rates or duties shall be due, paid, or demanded for "any boat, barge, lighter, or other vessel carrying "only oil-cakes, malt dust, pigeon dung, or manure "of any kind whatsoever on the said river or the said "new cuts or canals or any of them, or any part "thereof."

4499. So that the agriculturists on each side of the river throughout the whole length of the navigation have a beneficial interest in the maintenance of the navigation?—Unquestionably. There is a very large brickfield at Ware which has no other means of carriage except the road.

4500. (*Chairman.*) What is your present income and what rate of increase has taken place?—That, I think, will be best manifested by the traffic return, which will show it year by year.

4501. Is there anything further which you would wish to name to the Commission?—I think not, except that I will complete my list of Acts.

The witness withdrew.

Appendix No. 1. to Evidence of John Marchant, jun., Esq., Clerk to the River Lee Trust.

Statement (referred to supra, Question 4330) of Matters relating to the River Lee Navigation.

Constitution and Statutory Powers of the River Lee Trust.

stitution.

The navigation of the river Lee is managed and governed by a public trust, incorporated by the name of "The Trustees of the River Lee."

They derive their powers from various Acts of Parliament, the earliest of which were passed in the reign of Henry VI., one (cap. 5.) in the third year of his reign, (1424); and the other (cap. 9.) in the ninth year of the same reign (1430).

en. VI., c. 5. (1424.)
en. VI., c. 9. (1430.)

These two statutes empowered the Chancellor for the time being, to issue commissions for the purpose of clearing, scouring, and amending the river "Ley," which in both of them is stated to be "une des grandes rivers" of England.

The river appears to have been rendered navigable in the reign of Queen Elizabeth, and the constitution of the River Lee Trust, may be said to have been first established in that reign.

Eliz., c. 18. (1570.)

In the thirteenth year of Elizabeth (1570), an Act was passed (cap. 18.) "For the bringing of the river of Lee, to the north side of the city of London." By this Act the Lord Mayor, Commonality and Citizens of London, and their successors, were authorized to bring the said river of Lee from the town of Ware to the north side of the city of London, and by section 4. it was enacted, "That the said "Lord Mayor, Commonalty and Citizens, shall have the "whole jurisdiction, conservice, rule, and government as "well of the said New Cut River and ground of each side, "as also the royalty of the fish and fishing of the same, and "the profits of the said ground, soil, and water to them "and their successors for ever." Power was also given by this Act for the punishment of offenders and persons breaking the rules and orders provided for the preservation and maintenance of the said river.

The Lord Chancellor or Lord Keeper of the Great Seal of England was empowered to appoint and authorize by commission under the Great Seal of England, sixteen Commissioners, (namely four of the city of London, and four of each of the shires of Essex, Middlesex, and Hertford, having lands, tenements, or hereditaments of the clear yearly value of forty marks, and not being London traders,) who should have full power to treat, agree, and compound for the scouring, cleansing, repairing, and keeping of the said river Lee.

The navigation between the towns of Hertford and Ware was at this period under the control of the corporation of Hertford, but certain disputes arose between that body and the inhabitants of Ware and the New River Company as to the jurisdiction of those bodies, and in consequence of these

HERTFORD.

Mr. J. Marchant, jun.

19 Dec. 1866.

disputes an Act was passed in the twelfth year of the reign of George II., cap. 32. (1739.) "For ascertaining, preserving, and improving the navigation of the river Lee from the town of Hertford to the town of Ware in the county of Hertford; and for preserving and improving the said river from the said town of Ware to the New Cut or River made by the Mayor, Commonalty and Citizens of London; and for enabling the governor and company of the New River the better to supply the cities of London and Westminster, and the liberties and suburbs thereof, with good and wholesome water."

12 Geo. II., c. 32. (1739.)

By this Act the course of the river was defined, and certain persons therein named were appointed for the putting in execution the powers and trusts by them reposed by virtue of and in pursuance of that Act for the purposes therein expressed.

7 Geo. III., c. 51. (1766.)

In the seventh year of the reign of George III., cap. 51. (1766) another Act was passed, "For improving the navigation of the river Lee from the town of Hertford to the river Thames; and for extending the said navigation to the flood gates belonging to the town mill in the said town of Hertford."

By this Act the trustees appointed by the 12th George II., cap. 32., together with several other noblemen and gentlemen therein named were appointed, "Trustees for the making, extending, improving, and maintaining the navigation of the said river Lee, from the flood gates belonging to the town mill in the town of Hertford to the river Thames, and for putting this Act in execution;" and they were empowered to cleanse, scour, deepen, enlarge,

7 Geo III., c. 51, sec. 1.

or straighten the channel of the river Lee, and to make and maintain the new cuts therein described, and to build the bridges and works therein mentioned. (Section 1.)

Sec. 69.

By this Act the navigation was declared to be a free navigation for all the King's liege people, subject to the payment of such rates and duties which were thereby authorized to be levied.

Sec. 80.

The main source of revenue of the trust is provided by this Act which defines the tolls to be taken upon the navigation in respect of the commodities conveyed upon it.

9 Geo. III., c. 58. (1778.)

The trustees were authorized by the 19th George III., cap. 58. to raise certain additional tolls therein described.

45 Geo. III., c. 69. (1805.)

Another Act was passed in the 45th year of the reign of George III. (cap. 69), for the better preservation and further improvement of the navigation, defining certain heights of water, and giving power to the trustees to make byelaws

Sec. 10.

for regulating the lading of barges.

Sec. 12.

It was also provided that no craft should carry more than 40 tons of freight, but this provision has since been repealed by the Act next to be referred to.

13 & 14 Vic. c. 109. (1850.)

The next Act was passed in the 13th and 14th years of the reign of Queen Victoria (cap. 109), called "The Lee Navigation Improvement Act, 1850." The principal objects of this Act were to enable the trustees further to improve the navigation, and to dispose of the surplus water.

Sec. 8.

The trustees were incorporated by the name of "The Trustees of the River Lee," and were empowered to purchase and hold, and sell, demise, and dispose of lands for the purposes of that and the therein recited Acts.

18 & 19 Vic. c. 196. (1855.)

In 1855 arrangements for the supply of water to the New River and East London Waterworks Company were confirmed by the Act of 18 & 19 Victoria, cap. 196. "The River Lee Water Act, 1855."

Sec. 9.

By this Act the surplus water of the Lee, over and above the quantity required for the purposes of navigation, was vested in "those two companies respectively, subject nevertheless to such rights as might not then belong to the trustees."

Sec. 11.

The daily quantities of water reserved to the trustees for navigation purposes, and not subject to any control by the companies, are as follows:—

First. They may pass through their locks from the highest point at which the companies or either of them take their supply, down to and including the first lock above Feilde's weir (called "The Upper Reach"), not exceeding in any 24 hours 576,000 cubic feet.

Secondly. They may pass from the first lock above Feilde's weir exclusive down to and including Waltham town lock (called the Middle Reach), not exceeding in any 24 hours 720,000 cubic feet.

Thirdly. They may pass from Waltham town lock exclusive down to and including Old Ford lock (called the Lower Reach), not exceeding in any 24 hours 864,000 cubic feet.

All water below Tottenham mill, not required by the two companies at their drawing stations, is reserved to the trustees for navigation purposes.

Sec. 27.

The two companies are strictly forbidden, without the consent of the trustees, at any time to draw from the river so as to reduce the water in any pond of the navigation below the customary head level of that pond.

Sec. 30.

The priorities of rights to take the water of the river Lee are very clearly defined by this Act, and are as follows:—

First. The right of the trustees to the upper middle and lower daily quantities, and such further quantity as shall be necessary to maintain the water of the navigation on a level with the head levels aforesaid.

Secondly. The right of the New River Company to take 2,500 cubic feet a minute.

Thirdly. The right of the East London Waterworks Company to take 2,500 cubic feet a minute.

Fourthly. The right of each company to take *pari passu* 500 cubic feet a minute.

Fifthly. The right of each company, after notice, to take *pari passu* any additional quantity.

Sixthly. The right of the trustees to surplus water below Tottenham mill.

The body of trustees consists of the following *ex-officio* members, viz.:—

12 Geo. II sec. 16.

The Lord Mayor, Aldermen, and Recorder of the city of London for the time being; the Knights of the Shire for the county of Middlesex, the Members of Parliament for the city of Westminster, the Knights of the Shire for the counties of Essex and Hertford, the Members of Parliament for the boroughs of Colchester and Hertford; the Mayor of Hertford for the time being; and noblemen and gentlemen from time to time elected from the counties of Hertford, Essex, and Middlesex.

The governor, deputy-governor, and treasurer of the New River Company for the time being are also *ex-officio* members of the trust.

7 Geo. III sec. 1.

The trustees have, in execution of their powers, made new cuts and straightened the course of the navigation; they have removed locks and other obstructions; they have replaced old wooden locks with new brick and stone structures; and have otherwise expended very large sums in maintaining and improving the navigation between Hertford and London.

By the foregoing Acts the whole jurisdiction, conservice, government, and maintenance of the navigation of the river Lee has been for three centuries and is now vested in the trustees appointed under those statutes.

The trust has been regarded as one of great public importance, having for its sole object the public benefit and advantage.

Nuisances on the Navigation.

Hertford.

Commencing at Hertford there are but few cases of drainage into the river Lee, the town being sewered by the New River Company in order to purify the source of their supply below Hertford lock, the first on the navigation.

The sewers constructed by that company intercept the drainage of the town, and convey it to deodorizing works about a mile down the valley towards Ware. The sewage water after being dealt with at the works is conveyed down an open channel into the river Lee below Ware lock, about two miles south of Hertford, and just above the town of Ware.

The discharge from this channel, called the "Manifold ditch," is not generally offensive, but in the summer months during the prevalence of hot weather it is said to be so.

Communications upon the subject have passed occasionally between the Ware local board of health and the trustees of the river Lee, but the local board have the power in their own hands to deal with the nuisance if it be one.

Ware.

Within 500 yards of the Manifold ditch and discharging into the same pond of water is the outlet of the main sewer of the town of Ware, under the control and management of the local board of health. The sewage flows into the navigation in large volumes, and without any attempt being made to deodorize or purify it. A trap door is fixed at the mouth of the sewer, opening outwards by the action of the sewage.

This Ware sewer is undoubtedly a great nuisance to the navigation, and the neighbourhood of the outfall, and is one which calls for interference.

Another sewer flows into the navigation under Ware bridge, and takes the drainage of Amwell End. There is no attempt to purify the discharge of this drain.

In addition to the above, there are many privies and drains discharging into the river at Ware.

Stanstead.

There is no sewer falling into the river at Stanstead, but there are privies and drains which should be done away with.

Tottenham

There is no further serious drainage into the navigation below Ware until we reach Tottenham.

The East London Waterworks Company take their supply of water from the river above Tottenham lock.

In about the year 1853, that company constructed an intercepting drain or sewer, to intercept and divert the drainage and sewerage water from Enfield, Ponder's End, and Upper and Lower Edmonton, and part of Tottenham.

Previously this drainage found its way into the navigation through open and circuitous ditches, discharging into the river above Tottenham lock. The intercepting drain was made under the powers of the East London Waterworks Act, 1852, 15 & 16 Vict., cap. 164, (sec. 81).

It has its outfall into the Lee a few yards below Tottenham lock.

When this intercepting drain was constructed the discharge from it was comparatively innocuous, but the increase of population in the districts draining into it has caused a corresponding increase in the volume of discharge which is at times offensive. Large quantities of sewage, mud, and sand are also deposited in the bed of the Lee from the drain.

About a quarter of a mile down the river below the East London drain is an intolerable nuisance, caused by the discharge through an iron pipe into the navigation of the sewage of Tottenham, Wood Green, and West Green by the Tottenham local board of health. In hot weather the water in the neighbourhood of and for some distance below the outfall is black with filth, and the smell is most offensive.

The navigation is also injuriously interfered with by the deposit of mud along its bed.

The trustees of the river Lee have found this nuisance so intolerable that they have been compelled to file an information and bill of complaint in the Court of Chancery. An order has been obtained and is still in force, restraining the Tottenham board from making any further connexions with houses and drains until the hearing of the cause, which will be argued during next term.

ld Ford, Bow, ad Limehouse ut.

The state of the river from Old Ford to the Thames, which is the tidal portion of the navigation, is rendered very pestiferous during hot weather, owing to the discharge of impurities from various manufactories on the banks of the river there.

The Limehouse Cut is at times little better than a reeking ewer.

The trustees have endeavoured to prevent the increase of the nuisances there, but owing to the want of statutory and summary powers have only been very partially successful.

The Metropolitan Board of Works have constructed large storm-water outlets from their works at Old Ford, and in the year 1863, the discharge from these outlets was so enormous that the trustees were compelled to file an information and bill in Chancery, the result of which was a decree by the court, restraining that body from continuing the discharge, and directing the payment by them of 820*l.* in respect of the damage to the navigation by the deposit of the solid sewage in its bed, together with the costs of suit.

The mode of construction of the Metropolitan works is such as to render the repetition of this nuisance possible.

The trustees endeavoured to deal with the cases in the Limehouse Cut, but could get no relief for want of summary powers. On applying to the Thames Conservancy, who have jurisdiction over three miles of the river for nuisance purposes, that body attacked some of the cases, and obtained convictions on the evidence supplied by the officers of the trust.

This part of the river will be relieved of the drainage now discharged into it on the completion of the Metropolitan low-level sewers, which will intercept the drains of that locality.

Financial Position of the Trust.

evenue.

The trust derives its income from the tolls levied upon commodities carried upon the river; from certain annual payments for water supplied to the New River and East London Water Companies; and from the rentals of mills and other properties belonging to the trustees.

The whole revenue of the trust, from whatever source arising, is vested in the trustees, to be applied in paying the several annual payments directed to be made by the 7th Geo. III., c. 51; in paying interest upon money raised under their borrowing powers; and in improving and maintaining the navigation.

The estimated annual receipts are as follows:—

Tolls	£11,611
Water rents	3,500
Rentals of mills and other property	1,401
Sundries, including ballast	700
	£17,212

The estimated annual payments are as follows:—

Salaries	£1,300
Pensions	430
Lock-keepers' and collectors' wages	1,345
Maintenance and repairs, including materials	3,500
Mills and weirs	800
Land rents	180
Rent and taxes	600
Insurances	15
Printing, stationery, and advertising	165
Office disbursements	160
Sundries	97
Expenditure for maintenance	8,592
Interest on borrowed money, viz.:—	
Debenture loan 7,173	
Other loans 1,250	
	8,423
	£17,015

Capital. 2,630 = 4½ 4,543 = 5 — 7,173.

The amount raised on debentures under the borrowing powers of the trust is 149,287*l.*, viz., 58,412*l.* bearing interest at 4½ per cent., and 90,875*l.* at 5 per cent. In addition, the bankers have advanced 23,000*l.*, and the London Life Assurance Association the balance of a loan of 20,000*l.*, 2,000*l.*

The capital raised, therefore, stands thus:—

Debenture loan	£149,287
Loan from bankers	23,000
Ditto London Life Association	2,000
	£174,287

The trustees are empowered to raise the sum of 230,000*l.* upon the credit of the trust, so that their borrowing powers are unexhausted by the sum of 55,713*l.*

Progress of trade.

The progress of the traffic may be understood from the following statement, which shows that the income from tolls has nearly doubled itself within the last 15 years, viz.:—

	£
Tolls received in 1851	5,798
„ 1852	6,266
„ 1853	7,852

APPENDIX No. 2 to EVIDENCE of JOHN MARCHANT, Jun., Esq., Clerk to the River Lee Trust.

Copy of Notice to remove Nuisances given by the direction of the River Lee Trustees.

HERTFORD,
August 1864.

SIR,

At the annual inspection of the river Lee on the 2nd inst., the Trustees observed that considerable nuisance was occasioned to the navigation by the drainage from your into the River.

It is the imperative duty of the Trustees to preserve the river from contamination; I am therefore instructed to request that you will accept this as a notice to remove the cause of complaint from your premises without delay.

The next meeting of the Trustees will be held on Saturday, the 20th instant, by which time they hope to hear from you that you are taking active measures to comply with their requisition.

Your obedient servant,
JNO. MARCHANT,
Clerk to the Trustees.

HERTFOR

Mr. J. Ma chant, jun.

19 Dec. 186

Mr. J. Marchant, jun.

19 Dec. 1866.

Appendix No. 3 to Evidence of John Marchant, jun., Esq., Clerk to River Lee Trust, (referred to infra, Question 4829).

Abstract of the Receipts and Payments of the Trustees of the River Lee, for the Year ending 31st December 1866.

Receipts.

		Ordinary. £ s. d.	Extraordinary. £ s. d.
Tolls		11,581 5 0	
Water rents		3,441 13 4	
Sundry rents		1,060 11 10	
Loans, namely:—			
Upon debentures	£14,500 0 0		
Less debentures paid off	6,944 11 10		
		-	7,555 8 2
Sundries		412 2 7	
Ballast sold		298 4 4	
Repayments for sundry works		169 18 0	
Received from the New River Company on account of the reconstruction of Hertford lock		-	1,889 10 1
Purchase of property		-	115 0 0
		16,963 15 1	9,559 18 3

The MARQUIS OF SALISBURY examined.

The Marquis of Salisbury.

4502. (*Chairman.*) I believe that your lordship is chairman of the River Lee Trust?—I am.

4503. How many years have you acted as chairman of that trust?—I think about 15.

4504. Will your lordship please to describe the character of the trust; it is I believe an unpaid trust?—Entirely.

4505. You pay your officers?—We pay our officers, but the trustees have no remuneration whatever.

4506. They meet at stated periods?—We generally meet once a month, and at additional times if requisite. We pass our accounts in London once a year, and generally we have the benefit of the attendance of some members of the corporation, and on other occasions they also come, it is principally when we meet in London during the session of Parliament.

4507. What number of trustees is required to make a quorum for business?—I think three, but we cannot sign any cheque without five.

4508. Is there at any time any difficulty in getting a quorum to do the business of the trust?—None. I do not recollect an instance of it.

4509. The gentlemen who are nominated you find quite willing to pay that attention to the duties which is necessary for carrying on the business of the trust?—Quite so.

4510. I presume that your lordship is well acquainted with the character of the district through which the river passes?—I may say that I am entirely acquainted with the river Lee. I do not say that I am well acquainted with all the tributaries, but I am entirely acquainted with the river Lee from Luton down to Bow Creek.

4511. Is the river Lee almost becoming what one might term a necessity to the district?—An absolute necessity.

4512. What amount of traffic in tonnage is now carried on the river Lee?—I have it from 1851 to 1865, for periods of three years at a time. The tonnage from 1851 to 1853 was 215,639 tons; the tolls were 6,638*l.* There has been a regular increase in the tonnage. From 1863 to 1865 it was 340,547 tons, and the tolls were 10,259*l.* The tolls in this year have been increased most prodigiously. I am not quite sure that I can state them correct, as the accounts are not made up; 11,073*l.*, has been received up to the 15th of December, which is more than we received in the previous three years.

His Lordship delivered in the following table:

RIVER LEE NAVIGATION.—AVERAGE STATEMENT of TONS carried, and TOLLS collected per Annum, taken from Periods of Three Years during the last Fifteen Years.

Years.	Tons.	Tolls.
1851 to 1853 - -	215,639	£6,638
1854 to 1856 - -	254,051	8,046
1857 to 1859 - -	269,784	8,408
1860 to 1862 - -	310,695	9,552
1863 to 1865 - -	340,547	10,259
Tolls received to 15th December 1866- -		11,073

4513. Any scheme which seriously affected the navigation of the river Lee would, I assume, perhaps in a greater proportion affect the value of property on both its banks?—Most certainly. Very much indeed.

4514. May we consider that the property situated in proximity to the Lee, on both its banks, may be said to exceed the navigation in value and consequently in interest if affected by anything done upon the river?—It would depend upon how far you carried it; but certainly the land is daily rising very much in value all along on both sides.

4515. There are towns situated upon the banks of the Lee and its tributaries?—There are. I am not acquainted with the Stort.

4516. Has the population in the valley of the Lee been increasing of late years?—Very much.

4517. Then, of course, the trade of the district would increase with the population?—Certainly.

4518. I suppose that the navigation upon the Lee is convenient, as it takes the goods more immediately to the premises of persons situate on either bank than any other mode of conveyance yet established can accomplish?—More so certainly, and to a greater extent; but I apprehend also that the carriage of goods on the Lee is very much cheaper than that on the railroads.

4519. We have heard that the river Lee trustees carry the manure without charge. I need scarcely ask the question whether any railway company gives the same facility?—Certainly not.

4520. Then it would be depriving the adjoining landowners of a sort of property into the possession of which they have come, if anything interfered with that arrangement?—I should certainly think so.

4521. Can your lordship give us a statement of the weight of manure which has been carried for any fixed periods?—I can. In 1858 there were 22,000 tons, and in 1863 there were 109,000 tons. In consequence of the cattle plague there was a great falling off in 1864 and 1865, because we ordered no manure to go down the banks. I rather took upon myself to order no manure to go down the banks during the cattle plague.

His lordship delivered in the following tables:—

RIVER LEE NAVIGATION.

STATEMENT of TRAFFIC to and from the various Points during Eight Years—1858 to 1865 inclusive.

	1858.		1859.		1860.		1861.		1862.		1863.		1864.		1865.

*The falling off in manure in the year 1864–1865 was caused by the prohibitory laws in consequence of the Cattle Plague.

4522. (*Mr. Harrison.*) In the first of those returns can your Lordship separate the weight of artificial manure from the weight of horse manure and London manure?—No.

(*Mr. Glass.*) The artificial manure is a very small proportion; guano and rape cake are the principal things; rape cake has to be certified that it is to be used for manure, and also ashes.

4523. (*Chairman to the Marquis of Salisbury.*) In speaking of carrying the manure free you mean that you permit the farmers or other persons interested, to traverse the navigation free of toll?—Exactly so; we are not carriers.

4524. You are not carriers in any sense; you have no boats of your own?—We have some for the purposes of dredging. I think that there is nothing else; we do not carry for hire but only for our own purposes.

4525. You do not enter into competition with carriers?—Not at all.

4526. You simply maintain the navigation, and levy toll upon persons using the navigation, and you regulate the traffic?—Yes.

4527. (*Mr. Harrison.*) I observe upon the railway a number of trucks between this and London laden with manure?—Yes.

(*Mr. Glass.*) The owners of that manure must pay the railway company for its carriage. When it comes down in small quantities, perhaps the land adjoins the railway and is at a distance from the navigation. Our navigation does not extend beyond Hertford, and perhaps those trucks may be going further down, to Cambridge.

(*Marquis of Salisbury.*) I, myself, have been a large carrier of manure by railway, for my own purposes, and I think that the charge to me was 3*s.* 6*d.* a ton to Hatfield.

4528. What would the charge be upon the navigation for hauling?—That is a question which the traders must look to.

4529. The railway company are haulers as well as owners of the rates, so that it is quite possible that practically they merge any rates in the charge which they make for the carriage?—Probably.

(*Mr. Glass.*) They charge about 2*s.* to 3*s.*, according to the distance. It is generally done by the freighter; he pays for the manure and all; a man goes to the yards in London and gets a barge load of manure.

4530. I presume that your navigation has a beneficial effect as regards the farmers in the neighbourhood?

(*Mr. Glass.*) There is no doubt of it.

4531. (*Professor Way.*) But it is possible that in spite of rates not being levied on manure, if carried by the navigation, the cost might be quite as much or more than the carriage by railway?

(*Mr. Glass.*) It depends upon the barge owners.

4532. (*Professor Way.*) That does not give us any notion how cheaply the manure can be carried?

(*Marquis of Salisbury.*) I think that it is 14*d.* a ton to Hertford, that is the price of the manure altogether.

4533. The rates must be a small proportion of the carriage?—Yes.

(*Mr. Glass.*) It is about 6*d.* a ton?

(*Marquis of Salisbury.*) I used to import manure down to Hertford at 14*d.* for 40 tons, the parties furnishing me with the manure.

4534. (*Chairman.*) I presume that the trustees have had decisions as to parties polluting the water of the navigation?—To a very small extent.

4535. Do you consider that you have sufficient power to deal with the parties causing those pollutions?—I think not.

4536. Do you think that it would be advisable that some additional power should be provided to prevent this state of pollution which is growing up?—I think it very desirable indeed. The cases are rather frightful cases; there is, I think, one case of a man going up to Limehouse Cut, and dying of cholera within 48 hours; he was a bargeman from this part of the country; but there is an universal complaint of it.

4537. Have you arrangements with the two great East of London water companies, namely, the New River Company and the East London Company, for supplying water under certain conditions?—Yes, under an Act of Parliament of 1855.

4538. And you receive a certain rental from them?—We do.

4539. Do you consider that as trustees you have a moral obligation placed upon you to preserve the water pure for the use of the metropolis?—We certainly should think so; we should think it very desirable to do so.

4540. And I presume that you now, as far as your means will carry you, do what you can to prevent the pollution?—We do what we can to the full extent that we think that we have the power, or should be justified in applying the funds.

4541. But you know of your own knowledge, and also by hearsay, that impurities find their way into the river Lee, which forms a source of supply to the eastern portion of the metropolis?—Certainly.

4542. And I daresay that you have heard this autumn that cholera has prevailed very extensively in that eastern portion of London?—I have.

4543. Have you noticed that the Registrar General, whether rightly or wrongly, attributes the outbreak of cholera in some measure to the impure character of the water distributed by the East London Waterworks Company?—I have seen such a report.

4544. I presume that you are aware that that water does receive the sewage of a considerable population situate above the point at which they abstract it?—Certainly.

4545. The town of Luton is, I believe, situate near the head of the main river Lee?—The Lee rises immediately above Luton.

4546. And a large manufacturing population at Luton passes its sewage into the waters of the Lee?—I am not quite aware of what has taken place lately, but Mr. Leigh, when he bought Luton Park, made some arrangement with the town of Luton; there was a lawsuit about it, and the water is supposed to be diverted in his park.

4547. The water at Luton is dealt with in somewhat a similar manner to the mode in which it is dealt with here, the sewage is passed into depositing tanks, and the sediment is intercepted, and the effluent water passes into the Lee and goes on. Any person who calls that a purification of sewage does not understand the chemical character of the water, because it comes in to the tank true sewage, full of a solid deposit, and it simply passes out true sewage freed from the solid deposit?—I am aware that that is the fact. I was not aware what the arrangement was.

4548. We may take it all the way down. We have yet had no evidence that there is any true utilization of sewage by applying it in irrigation to land?—No; I should think that the valley is never wide enough to allow of such utilization, even if it is good.

4549. Would the application of pumping enable

HERTFORD.

The Marquis of Salisbury.

19 Dec. 1866.

you to put it in another position than that in which it would go by gravity?—I should think it very difficult, the banks are rather steep.

4550. Looking at the constitution of the River Lee Trust, is it the opinion of yourself as chairman that the trustees would take upon themselves the necessary duties, if Parliament granted them the power, to prevent these pollutions through their servants?—Do you mean from Luton?

4551. Taking the whole valley of the Lee, supposing a conservancy board to be formed, would the trustees be willing that they should be constituted a conservancy board, having proper powers and proper authorities to prevent in a practical way these nuisances which now pollute the Lee and its tributaries?—My own opinion is that they would, but they must have means to do it beyond their navigation.

4552. You have now the means of arranging with the two great water companies to receive a rental for the water which they take from you, and to carry out works by arrangement and agreement with them, they paying the costs?—Yes.

4553. Assuming that Parliament thought fit to devise some machinery by which you should be required to give notices to these towns which now pollute the streams, calling upon them to show you through their engineers the way to prevent that pollution, and either to compel them to carry out the work under your supervision, or to enable you to carry it out, and to charge them with the cost, do you think that such a form of conservancy could be made to work?—I think that it could perfectly, and the more so because the members for Hertfordshire, and Essex and Middlesex, and the members for this town, and the mayor of this town, all form a part of the board *ex officio*.

4554. Do you think that the present constitution of the board is such as would justify Parliament in placing such powers as are indicated in their hands?—I think so.

4555. What is the gross number of the trust at present?—67, that is including the *ex officio* members.

4556. What is the mode of election?—The greater portion of the members are *ex officio*.

4557. By reason of their position and holding property?—Yes; and the remainder are elected by our own board, notice being given that such a person will be proposed.

4558. Is there any check upon the acts of the trustees. Supposing that any trader upon the river Lee feels himself aggrieved, is there any superior board of appeal to which he can go for redress?—I think not; we generally have some of the principal traders upon the board.

4559. But is there any board of appeal if any person wishes to appeal?—I am not aware that there is any.

4560. In the event of a conservancy being established do you think that it would be advisable that any board of appeal should exist, such as the Board of Trade, or the Privy Council, or the Home Office?—I apprehend that there could be no objection to it whatever, but if I were to name the board I should say the Board of Trade or the Privy Council.

4561. If Parliament were to authorize powers of conservancy similar to those now exercised by the conservancy board of the river Thames, do you think that it would be advisable that the Government should have the power to nominate one or more members upon the trust as they have to nominate such members upon the conservancy board of the Thames?—I do not think that it would be desirable, because such a member must naturally be immediately the head person of the trust, and give his constant attention to it.

4562. The Government, I think, have power to nominate one or two members upon the conservancy board to act as the other members act?—I do not think that it would answer well. I would give every facility of appeal, but I think that what you suggest would impede the action, because it would be exactly as it is in London, namely, that wherever you have a stipendiary magistrate he takes the thing into his own hands.

4563. I do not anticipate anything of that sort; you would appoint your own engineer and your own clerk, just as you appoint your servants now, and would have power to pay them?—I do not think that the suggestion would answer.

4564. (*Professor Way.*) A member of the Admiralty board has been on the board for years?—He very seldom attends the meeting.

4565. (*Chairman.*) In the case of the Thames such a member attends, the Admiralty being supposed to have a direct interest, but the Admiralty has no direct interest in your navigation?—No; I do not think that is a very desirable thing.

4566. (*Professor Way.*) I presume that the object would be that in case of any point arising in which Government interference would be requisite some member of the board should be in communicafion with the officers of the Government; you know that at present the new conservancy of the Thames has that element?—I was not aware of that fact; I myself do not think that it would be a desirable mode, because it would be a party matter. Where I have known it to exist it does not seem to me to work satisactforily; it ends in an absence from interference on the part of the other members.

4567. (*Chairman.*) Your lordship is aware that the Local Government Act has been adopted by many of the towns and parishes, and townships upon the banks of the Lee and its tributaries?—I believe that it has.

4568. When the Local Government Act is put in force I suppose your lordship is aware that it sets up a local authority, and that there must be a chairman and members?—Yes.

4569. As they for the most part are the sources of pollution they would be the parties with whom you would have to interfere to prevent pollution. Do you think that it would be advisable that the chairman of those local boards should sit at the conservancy board?—Certainly not.

4570. They are the persons whom you have to keep in order, and they are not to keep you in order?—Just so.

4571. (*Mr. Harrison.*) Would you exclude the mayor of Hertford?—Certainly not; he is an *ex officio* member.

4572. But, I suppose, that he is at the head of the polluting system?—He has the advantage of being approved by a magistrate. I have had put into my hand a letter which shows how little the local boards are inclined to act. This is an answer to our application to the Ware local board on account of the nuisance created by the Ware sewage: "Dear sir,—I "submitted your letter of the 27th instant to the "board at their last meeting, relative to the drains "discharging into the river Lee near the summer-"houses at Ware, and also below Ware bridge, and I "am directed to inform you that the board see no "reason for taking any measures for the diversion "of any drains belonging to them."

4573. (*Chairman.*) With regard to the conservancy which we have been speaking about, in your opinion would this Commission be justified in making a recommendation that the trustees should be consulted by Her Majesty's Government as to the future management of the Lee, going no further than that?—Certainly; I should think it very desirable.

4574. It has not been settled yet which department of the Government shall undertake the duty of bringing in a bill, but when a bill is brought in you think that they should communicate with your lordship and the trustees as to the form which the future conservancy should take?—I think that it would be very desirable, and I am sure that the trustees would give their best attention to it.

4575. May we assume that the trustees would rather not have an entirely new board placed above them, and having jurisdiction over the valley and over the river Lee navigation?—I am quite certain that it could not

be done, and that there would altogether cease to be an attendance.

4576. If any new conservancy board were set up there would have to be paid officers, and they would, in some degree, come into antagonism with you as managers of the river Lee for navigable purposes, but having interests also in keeping the river free from impurities?—Yes.

4577. (*Professor Way.*) I suppose that we may take it to a certain extent, that you would have less difficulty in so modifying, if necessary, your trust as to make a conservancy board than the conservancy of the Thames had, seeing that in that case there were two jurisdictions, one of which had to be abolished?—Certainly.

4578. You have nothing of the kind, you stand without any sort of supervising jurisdiction?—Entirely so.

4579. (*Mr. Harrison.*) Is it quite so; have not the New River Company and the East London Waterworks Company such an interest in the water of the river Lee and in its condition, as to purity, that they would like to be represented upon your board?—By our constitution the governor and deputy-governor of the New River Company are *ex officio* members of the trust.

4580. Is there any representation of the East London Waterworks Company upon your board?—I think not.

4581. Do you think that that would be desirable?—I think that it would be introducing a new element. We have never found that the New River Company have interfered to make the water more pure, and there would be an antagonistic principle introduced between the East London Waterworks Company and the New River Company. The New River Company have never interfered except as to the formation of a storing reservoir; they have never attended a board meeting except during that negotiation.

4582. (*Chairman.*) I suppose that this Commission may understand that the River Lee Trust would decidedly object to any interference with their existing powers in the way of diminishing or crippling those powers, but that they would be willing to be consulted as to any addition to their powers for the prevention of the nuisances which have grown up in the district?—I believe that that is quite correct.

4583. Has there been any system of drainage carried out in the valley with which your lordship is acquainted?—In my own parish, in my own park.

4584. Is there much undrained land on the margin of the Lee as far as you are acquainted with it?—I should think that all the marshes are very low, and in many portions the river is above the marshes.

4585. What is the character of the works which have been carried out in your own park?—They are very rough.

4586. Is the result beneficial?—It has completely stopped the arrival of the sewage into the river. Here is a rough plan (*producing the same*). I began the work in the first instance by sinking wells at different places, but I found that my wells answered the purpose for only two or three years. About 15 years ago I made this work (*pointing to the plan*). These are the holes which I made in the valley to intercept the sewage from the river. I have a statement of the expense, and I have the quantity of sewage; about one-third of that is earth. I have the quantity which we have got out for 1863, 1864, and 1865.

4587. (*Mr. Harrison.*) Is this for the interception of the sewage from your mansion?—It is for the sewage from the town of Hatfield. The first attempt was merely to turn it into a chalk pit, and get rid of it.

4588. (*Professor Way.*) That was happily unsuccessful?—I had reason to be satisfied with it, except that I had to sink a fresh chalk-pit every two or three years, and then I adopted this plan, which does the work perfectly in that way till it gets charged; but it is a work of several years. The solid part of the sewage is stopped by gratings, and by a man who is kept to throw it up and cover it over with mould. The liquid part goes into this chalk pit by having two holes acting as a syphon; the sewage goes down into the chalk with the water, and of course the water rises up on the other side, so that no effluvium can escape so long as the thing works.

4589. (*Chairman.*) Has your lordship's attention been at all directed to the question of utilizing the flood waters of the valley of the Lee, so as to make them available for metropolitan water supply?—There is no difficulty at all about it. An excellent plan was introduced, and it was brought into Parliament, and no doubt would have been carried into effect, but there was a gentleman then at the head of the river Lee board who was frightened at the expense. I will read the notice which was given of that bill in 1850 for the session of 1851.

4590. Was that a notice given by the River Lee Trust?—No, by the New River Company; we were parties who were agreeing with them.

4591. You sanctioned it?—Yes, we were ostensibly the promoters.

His lordship read the notice, as follows:

River Lee Trust.

Amendment of Acts; Extension of Powers; Enlargement of existing Works; and Construction of new Works.

Notice is hereby given, that application is intended to be made to Parliament in the ensuing session for leave to bring in a bill to enable "the trustees of the river Lee" to effect all or any of the objects hereinafter mentioned, (that is to say) to make, maintain, vary, extend, or enlarge the following works, viz., first, a reservoir on the river Lee, commencing in Hatfield Park at or near Cecil Hill in the parish of Bishop's Hatfield, and terminating by an embankment to be constructed across the valley of the Lee, near Roxford farmhouse, in the parish of Bayford, and which reservoir and embankment will be situate in the parishes, townships, or extra-parochial places of Bishop's Hatfield, Essendon, Bayford, Hertingfordbury, and Brickendon, some or one of them; second, a reservoir adjoining the river Lee, commencing and terminating at or near Ware Mill lock in the parishes, townships, or extra-parochial places of St. John's, Hertford, Ware, Little Amwell, and Great Amwell, some or one of them; third, a reservoir on the river Rib, commencing near Stondon Lordship House, otherwise Standon Lordship House, in the parish of Stondon, otherwise Standon, and terminating by an embankment to be constructed across the valley of the Rib at or near Swangles, in the parish of Thundridge, which embankment and reservoir will be situate in the parishes, townships, or extra-parochial places of Stondon, otherwise Standon, Thundridge, Ware, and Ware-side, some or one of them; fourth, a reservoir on the river Ash, commencing at or near Widford Mill in the parishes of Widford and Ware, or one of them, and terminating by an embankment across the valley of the Ash, at or near Easney Park Wood in the parishes, townships, or extra-parochial places of Widford, Ware-side, Ware, and Stanstead Abbott's, some or one of them; fifth, a tunnel, pipe-track, aqueduct, cut, or channel of communication, from the first-named reservoir near Roxford farmhouse, to the secondly above-named reservoir near the Ware Mill lock, and which said tunnel, pipe-track, aqueduct cut, or channel of communication will pass in, through, or into the parishes, townships, or extra-parochial places of Bayford, Hertingfordbury, Brickendon, Saint Andrew's, Hertford, All Saints, Hertford, St. John's Hertford, Ware, Little Amwell, and Great Amwell, some or one of them; sixth, a tunnel and conduit, cut, or channel of communication from the thirdly above-named reservoir, commencing at or near Timber Hall in the parish of Thundridge, and terminating at the fourthly above-named reservoir, near Hole farm, in the parish of Ware, and which last-mentioned tunnel, conduit, cut, or channel of communication will pass in, through, or into the parishes, townships, or extra-parochial places of Thundridge and Ware, or one of them; seventh, a tunnel, pipe-track, aqueduct, cut, or channel of communication from the fourthly above-named reservoir, at or near Easney Park Wood, to extend across the valley of the river Lee, and terminating in the bed of the New River, near the village of Amwell; and which said last-named tunnel, pipe-track, aqueduct, cut, or channel of communication will pass in, through, or into the parishes, townships, or extra-parochial places of Ware, Stanstead

HERTFORD.

The Marquis of Salisbury.

19 Dec. 1866.

Abbott's, Great Amwell, and St. Margaret's, some or one of them; together with all other necessary cuts, sluices, pipe-tracks, channels of communication, aqueducts, embankments, tunnels, and other works for connecting the said reservoirs, tunnels, cuts, channels, and aqueducts with the river Lee and New River, both or either of them; all which said reservoirs, cuts, pipe-tracks, channels, aqueducts, embankments, tunnels, and works, will be made and maintained, and pass from, in, through, or into the several parishes, townships, or extra-parochial places of Bishop's Hatfield, Essendon, Bayford, Hertingfordbury, Brickendon, St. Andrew's, Hertford, All Saints, Hertford, St. John's, Hertford, Little Amwell, Stondon, otherwise Standon, Thundridge, Ware, Widford, Ware-side, Stanstead Abbott's, St. Margaret's, Little Amwell, and Great Amwell, some or one of them. Also to make and maintain all proper and necessary balance engines, gauges, tumbling bays, and other devices and works, on and near the New River and river Lee, at and below Fielde's weir, for correctly ascertaining the flow of water, and to remove all existing balance engines, gauges, tumbling bays, and other devices and works.

And it is also intended by the said bill to take powers to alter and improve certain parts of the course of the New River, and for that purpose to make and maintain the several works herein-after mentioned in the lines and according to the levels defined upon the plans and sections herein-after referred to, that is to say:—the first of such works, consisting of cuts or channels of communication, pipe-tracks, and widenings of the said New River, and commencing at a point about 214 yards above the bridge over the New River (numbered 4) in the parish of St. John, Hertford, and terminating at the bridge over the New River in Theobald's Lane in the parish of Cheshunt. The second of such works, consisting of cuts or channels of communication, pipe-tracks, tunnel, and widenings of the said New River, and commencing at a point about 290 yards above the foot-bridge over the New River in Theobald's Park (numbered 51*a*) in the parish of Cheshunt, and terminating at the north-east end of the reservoirs of the governor and company of the New River brought from Shadwell and Amwell to London in the parish of Stoke Newington, otherwise Newnton; with a branch pipe-track, conduit, or channel of communication, commencing at a point above 213 yards above the bridge over the said New River (numbered 82) and terminating at a point about 100 yards below the bridge over the said New River (numbered 105) in the parish of Edmonton; and also with a branch pipe-track, cut, conduit, or channel of communication commencing at a point about 30 yards above the bridge in the Seven Sister's Road over the New River, and terminating at the eastern end of the Stoke Newington reservoir of the said governor and company in the parish of Stoke Newington, otherwise Newnton. The third of such works, consisting of cuts or channels of communication, pipe-tracks, and widenings of the river, and commencing at the south-west end of the reservoirs of the said governor and company in the parish of Stoke Newington, otherwise Newnton, and terminating at the aqueduct of the said river over the East and West India Docks and Birmingham Junction Railway in the parish of Saint Mary, Islington. Fourth, a reservoir on the New River commencing at or near Clay Hill farmhouse in the parish of Tottenham, and terminating near to the bridge over the said New River in White Hart Lane in the said parish of Tottenham. Fifth, a reservoir on the New River commencing at the bridge in the Green Lane on the New River, near to the Stoke Newington reservoirs of the said governor and company and terminating at or near to the Eel Pie House Tavern, Highbury Vale, in the parish of Hornsey. All which works will be made in or pass through, from, or into, the parishes, townships, or extra-parochial places following, or some of them (that is to say), St. John's, Hertford, Little Amwell, Great Amwell, St. Margaret's, Hoddesdon, Broxbourne, Wormley, Cheshunt, Enfield, Edmonton, Tottenham, Hornsey, Stoke Newington, otherwise Newnton, and St. Mary's, Islington; and also to make and maintain all necessary tunnels, pipe-tracks, sluices, embankments, aqueducts, cuts, or channels of communication for the convenient use and maintenance of such several works, and to remove all such existing works as may interfere therewith; and also for the purpose of improving the drainage, to alter and shorten the course of a certain common sewer on Chase-side in the parish of Enfield, in the manner and direction shown upon the plans herein-after referred to, such alteration being intended to commence at a point in the highway from Chase-side to Enfield Church, near the bridge over the New River (marked No. 69), and to terminate by a junction with the common sewer in Enfield Street where such sewer crosses the highway aforesaid. The whole of such alteration being in the said parish of Enfield.

And it is also intended to apply for powers more effectually to prevent the contamination of the river Lee and New River, or either of them, or any stream, reservoir, aqueduct, or other works connected therewith respectively.

Also to form a roadway, with all necessary bridges, approaches, and works from the bridge across the navigable cut of the river Lee, near the Hertford gas-works, to the public road leading from Bengeo to Ware Park, and which roadway will pass through or into the parishes, townships, or extra-parochial places of St. John's, Hertford, and Bengeo, or one of them.

Also to vary, divert, or stop up and relinquish the Ordnance corn millstream, otherwise Waltham Abbey millstream, and the tail and waste channels leading therefrom, by constructing an embankment across the said corn millstream, at or near the point where it diverges from the old river Lee at Edmondsey Meads in the parish of Waltham Holy Cross. Also to vary, divert, or stop up, and relinquish that branch from the river Lee forming Stewartstone Mill Head and the tail waters and waste channels leading therefrom (which last-mentioned branch diverges from the main channel of the river Lee at or near the sluice at Enfield Lock in the parish of Enfield) and that branch from the river Lee and tail waters and waste channels leading therefrom forming Chingford Mill head and tail (part of which said branch diverges from the river Lee at or near Ponder's End Lock), and also forming that branch of the river Lee called Walthamstow Copper Mill head and tail, and the waste channels leading therefrom, all which streams now terminate in the river Lee at the Copper Mill stream near High Bridge in the parish of Walthamstow, and run from, in, through, or into the parishes, townships, or extra-parochial places of Cheshunt, Waltham, Waltham Holy Cross, Sewardstone, Enfield, Edmonton, Chingford, Walthamstow, and Tottenham, or some or one of them; and also to form a tumbling-bay and cut from the river Lee immediately above the Stone Bridge lock to a point in the same river immediately below such lock, and to make and maintain all such embankments, sluices, and other works as may be necessary for varying, diverting, or stopping up the said streams, channels, and tumbling-bay; and also to construct all such new works as may be necessary for the convenient use and maintenance of such new reservoirs, cuts, aqueducts, and tunnels, and such diverted or improved streams, channels, tumbling bays, and other works, and to remove all such existing works as may interfere therewith; and also to abandon and discontinue using, as the channels of such streams and branches, any portions of the existing courses or lines of the river Lee which may be rendered unnecessary by reason of the execution of the proposed new reservoirs, cuts, channels, or works, and generally to take powers to construct all such new works and remove all such existing works or other obstructions as may be necessary for effecting the objects of the proposed bill. And it is also intended by the said bill to take powers to divert into or cause to flow or proceed through or into the proposed works the waters which flow in or supply the streams, cuts, canals, reservoirs, aqueducts, or navigations herein-after mentioned, that is to say, the river Lee and the several streams, cuts, canals, reservoirs, aqueducts, and navigations connected therewith, videlicet:—The Hertford cut, Parker's cut, Hadsley's cut, Stanstead cut, the cut next below Stanstead bridge, Fielde's Weir cut, Dobb's Weir cut, Hoddesdon or Lins mill-tail, Broxbourne mill-head and tail, Carthagena cut, Waltham cut, Cheshunt mill stream, Powder mill stream, Waltham Abbey mill stream, Waltham Common Cut, Enfield Cut, Enfield Mill Stream, Edmonton Cut, Chingford mill stream, Tottenham Mill Stream, and Tottenham New Cut, Walthamstow Mill Stream, the Hackney Cut, Temple Mill Stream, Abbey Mill Stream, West Ham Waterworks Stream, City Mill Stream, Stratford Mill Streams, Pudding Mill Stream, otherwise Hunter's Mill Stream, the Three Mills Stream, the Bow Creek and the Limehouse Cut, the river Mimram, and the several streams, cuts, canals, reservoirs, and aqueducts connected therewith; the river Beane and the several streams, cuts, canals, reservoirs, and aqueducts connected therewith; the river Rib and the several streams, cuts, canals

reservoirs and aqueducts connected therewith; the New River and the several streams, cuts, canals, reservoirs, and aqueducts connected therewith; the river Ash and the several streams, cuts, canals, reservoirs, and aqueducts connected therewith; the East London Waterworks Company's cuts, canals, reservoirs and aqueducts; Sir George Duckett's Canal, otherwise the Lee Union Canal, and the streams, cuts, canals, reservoirs, aqueducts and navigations connected therewith; the Regent's Canal and the several streams, cuts, canals, reservoirs, aqueducts, and navigations connected therewith and the river Thames.

And it is also intended by the said bill to take powers to make and maintain a sewer or drain, or sewers or drains, and culverts, sluices, and other works connected therewith, for intercepting and diverting the sewage of all sewers and drains from emptying into the rivers Lee, Beane, Mimram, Rib, Ash, and Stort, or any of them, which sewer or drain, or sewers or drains, will commence on the north side of Cowbridge in the parish of St. Andrew, Hertford, and will be made and maintained, or will pass from, in, through, or into the parishes, townships, or extra-parochial places following or some of them (that is to say), St. Andrew's, Hertford, All Saints, Hertford, St. John's, Hertford, Little Amwell, Ware, and Great Amwell, some or one of them, and will terminate at or near Amwell Marsh bridge in the parish of Great Amwell. And also to take power to prohibit and prevent any drain or sewer from flowing into the river Beane below Sele Mill in the parish of St. Andrew, Hertford, or into the river Lee between the Horns Mill in the liberty of Brickendon, andAmwell Marsh lock, or into any part of the New River; all which parishes, townships, or extra-parochial places herein-before mentioned are situate within the counties of Hertford, Essex, or Middlesex, some or one of them.

And it is also intended by the saidbillto take powers to make lateral deviations from the lines of the said intended works to the extent and within the limits defined on the plans to be deposited as herein-after mentioned, and to purchase, lease, and otherwise acquire, compulsorily or by agreement, lands, houses, mills, and other hereditaments, corporeal or incorporeal, and to stop up, alter, or divert roads, railways, rivers, canals, cuts, aqueducts, tunnels, drains, sewers, reservoirs, and streams for the purposes of the said bill, and to extinguish any existing rights and privileges, which may interfere therewith; to provide compensation to the owners and tenants of mills in such manner as may be deemed expedient, and also to take power to raise money for carrying out the objects and provisions of the said bill; to levy tolls, rates, duties, and water rents for or in respect of the several purposes of the said bill; to alter existing tolls, rates, duties, and water rents, and to confer, vary, or extinguish, exemptions from tolls, rates, duties, and water rents; and also to authorize the trustees to appoint committees of their number with such powers as may be deemed expedient, and to confer, vary, or extinguish all such powers, rights, and privileges, as may be necessary for carrying into execution the purposes and provisions of the existing Acts hereinafter mentioned and of the said bill.

And notice is also hereby given that duplicate plans and sections, describing the lines or situations and levels of the several intended works before mentioned, and the lands in or through which the same are to be made, maintained, varied, extended, or enlarged, together with a book of reference to such plans, containing the names of the owners or reputed owners, lessees or reputed lessees and occupiers, of all lands and houses in the line of the proposed works or within the limits of deviation as defined upon the said plans, and describing such lands and houses respectively, with a copy of this notice, as published in the "London Gazette," will, on or before the 30th day of November 1850, be deposited at each of the following places, that is to say, with the clerk of the peace for the county of Hertford at his office at St. Albans; with the clerk of the peace for the county of Essex at his office at Chelmsford; and with the clerk of the peace for the county of Middlesex at his office in Clerkenwell Sessions House; and a copy of so much of the plans, sections, and book of reference as relates to each of the several parishes before mentioned, with a copy of this notice, will, on or before the said 30th day of November, be deposited with the parish clerk of each such parish at his place of abode, or, in the case of any extra-parochial place, with the parish clerk of some parish immediately adjoining thereto at his place of abode.

And notice is further given, that it is intended by the said bill to alter or amend, or in whole or in part to repeal, the following Acts, and any Acts therein-mentioned or referred to (that is to say), 13th Elizabeth, chapter 18; 3rd James I., chapter 18; 4th James I., chapter 12; 11th George II., chapter 14; 12th George II., chapter 32; 7th George III., chapter 51; 19th George III., chapter 58; and the Local and Personal Acts, 45th George III., chapter 69; 47th George III., chapter 72; 48th George III., chapter 8; 3rd George IV., chapter 109; 10th George IV., chapter 117; and 13th and 14th Victoria, chapter 109.

Dated this 11th day of November 1850.

JOHN MARCHANT,
Clerk to the Trustees, Ware.

In short, any attempt to divert the sewage without some reservoirs would be almost impossible, because with every diversion of the sewage you would lose a great quantity of water, which must be supplied in some way or other.

4591*a*. Then I may assume that you think that it would be necessary that any legislative powers should arm the trustees with authority to look at all points, and should enable them to devise and carry out the prevention, or assist in preventing the pollution of the river, and in providing for the increased volume of pure water which may be passed on to the metropolis?—I think so; but that I think would be a matter for a special Act of Parliament.

4592. I assume that you have heard that it has been proposed to bring in increased supplies of water to the metropolis, from North Wales by one scheme, and from Cumberland and Westmoreland by another scheme?—I have.

4593. If the river Lee itself and the waters falling into the valley of the Lea were properly dealt with, do you think that such a scheme might be more economical than going to such a distance for water for the metropolis?—530,000*l*. was the estimate given in the case of the bill of which I have read the notice, dated in 1850.

4594. (*Professor Way.*) That was for increasing the available supply of water, and for improving its quality?—Yes.

4595. (*Chairman, to Mr. Beardmore.*) I assume that an estimate was made of the probable income which would be yielded from the works so as to cover the expenditure?—(*Mr. Beardmore.*) I do not know whether that was gone into, because the companies dropped the scheme at an early date. We did not go into evidence before Parliament upon it. With the prospect of a very largely increased supply of water we no doubt reckoned on a large increase of revenue from the water.

4596. (*Mr. Harrison.*) Were the embankments which you proposed to make so as to form these reservoirs to be constructed in any case upon the chalk formation?—(*Marquis of Salisbury.*) I think that in most of these streams the embankments are already made by the millowners, and that they would only require a little raising.

4597. (*Professor Way.*) This proposal was made in 1850?—Yes.

4598. Has anything which you know of occurred in the interval which would cause a serious alteration in this plan, supposing the powers existed to put it into operation?—I should think not.

4599. You think that the plan would be now available?—Yes; of course the expense of the land would be increased.

(*Mr. Beardmore.*) The plan would have to be modified.

4600. That scheme was dropped from the want of means and power to carry it through?—(*Marquis of Salisbury.*) It was dropped, I think, from the want of means; there was no opposition to it.

4601. Supposing that your board of trustees were constituted a conservancy board, would the resuscitation of that plan in any form be possible and desirable?—I think that with certain modifications it would be very desirable. Of course I cannot speak to the details of a plan before Parliament.

4602. (*Chairman.*) I suppose that we may assume that the trust would watch very narrowly any scheme

HERTFORD.

The Marquis of Salisbury.

19 Dec. 1866.

of that magnitude and character brought in by what one may term outside persons?—Certainly.

4603. If such a scheme were brought in by any speculators wishing to utilize, as they would term it, the waste waters of the Lee for commercial purposes you would look very earnestly at it before you permitted them to obtain parliamentary powers, if you could prevent their doing so?—I should decidedly think so.

4604. (*Mr. Harrison.*) There was one point which I think your lordship raised just now, and did not give a full explanation of; it was as to the funds which the trustees of the Lee would require in case they were formed into a conservancy board such as you recommend. You said that the funds would be a difficulty. Where do you think that the requisite funds could be obtained from?—I think that the requisite funds might be readily obtained by imposing full costs and penalties wherever a nuisance was supposed to exist.

4605. Do you expect that they would be sufficient to pay for the supervison of the valley of the Lee?—As a board of conservancy has been proposed, it would only require the supervision of the channel of the Lee which we at present perform, but I apprehend that we could not embark in litigation with boards. If we required expensive alterations we should be opposed by local authorities unless we did it at our own cost.

4606. You would require a summary means of punishing those who committed a nuisance, so as not to entail much expense?—Yes; the cost of the litigation with the metropolitan board was upwards of 1,000*l.*; our funds will not allow us to carry on proceedings of that kind.

4607. (*Chairman.*) As a board having public duties, and having no pocket interest in exercising those public duties, supposing that you were placed in a position where it was necessary to raise additional funds to carry out works of great public utility, do you think that you would be in a condition to ask the Government of the day to allow the Chancellor of the Exchequer to issue exchequer bonds at a low rate of interest, you giving the security of the navigation so as to get the money at a less rate of interest than you could get it at in the commercial market?—I rather think that there is always a condition of repayment in the advance of exchequer bonds, and generally I believe it is in 30 years; there would then be the necessity of a sinking fund, which would add very materially to our expense.

4608. If you want anything like half a million the Exchequer Loan Commissioners, without any injury to any person in the State, can lend that money in the present condition of the money market at 3½ per cent.?—Just so.

4609. If you repaid that money in 30 years the annual payment would be about 5*l.* 5*s.* per cent.?—Just so.

4610. I believe that for certain public purposes, and also for private purposes, the Exchequer Loan Commissioners have been authorized by Parliament from time to time to make loans, for instance, for land draining?—Yes.

4611. For carrying on public works in Ireland?—Yes.

4612. And recently for carrying on certain public works in Lancashire, for the relief of the distressed cotton labourers?—I am aware of that.

4613. That money being repayable by annual instalments with interest?—Yes.

4614. It has been considered a very great advantage in many of these places (in Lancashire, for instance, where works have been carried out) for the local authorities to get that money at 3½ per cent., and yet Government will not necessarily lose one farthing in the transaction?—Just so; but I am not quite sure that it would not entail a loss upon the parties who would be supposed to profit by it, because the whole of the country said to be benefited by it would not have anything to do with the supposed relief.

4615. Looking at it in that view you think it better to go on as you have done and to raise any money required in the open market upon such terms as you can raise it?—I think so, and I think that it would rather tend to more economy in the management.

4616. If you have power to borrow and to reborrow it always gives you the power of rectifying your loan by the existing state of the money market?—Exactly so.

4617. If you pay off a debt which you owe to a party, which debt is at 4½ per cent., and you can borrow money at 3½ per cent, you can as a trust relieve yourselves to that extent?—Yes, and we should feel bound to do so; it would be a financial operation, whether it was wise or not wise.

4618. You do not borrow in perpetuity, but you borrow for a limited term?—Yes.

4619. Having the power of repaying the money, or of borrowing to pay off the bonds which you have accepted up to that time?—Yes.

4620. You, I suppose, accept bonds for three, five, seven, and 21 years?—We have never gone beyond seven years.

4621. But those bonds are, I presume, renewable if agreeable to yourselves and to the parties?—If they are allowed to run on beyond the period we put a condition that the debentures shall be realisable at six months' notice.

4622. Are those debentures easily transferable?—Very much so.

4623. Are they taken by trustees?—(*Mr. Marchant.*) They are made available for trustees.

4624. And they can recover their money at short notice?—(*Marquis of Salisbury.*) Yes, in three, five or seven years, and afterwards at six months notice just like the case of any other mortgage.

4625. That makes it an available means of investing money, and one which many persons are very glad to have an opportunity of availing themselves of?—Just so.

4626. And you consider that you have a secure basis for paying the interest?—I can only say that I think so, for I am a very considerable debenture holder, but of course it is a matter of opinion. We have been in great difficulties during the last year and a half; we have had very heavy works to carry on and have had very great difficulty as regards the money, but our bankers have not hesitated to advance us money.

4627. (*Professor Way.*) We have been informed that you have a surplus of profits at this moment?—Yes.

4628. Supposing that you borrowed money from the Government funds at a less interest and paid off the old debt, would not that surplus be available for the gradual liquidation of the debt?—I think not for many years, because we have still considerable improvements to make.

4629. But you would have the means of borrowing a much larger sum at a lower interest?—We might have, but I am not quite sure that we should judge wisely in going too largely into things at once. We should get into a great system of contracts. I certainly should not recommend it; I would rather go on quietly. We are now in very good condition except with reference to two or three locks, and the sills of those locks must be lowered to enable us to make the navigation throughout navigable for boats of 120 tons, which is supposed to be our limit. It was only available for 40 tons. We carried a little more than we were authorized to do, and we now carry commonly 80 or 90 tons.

4630. You are not in the same position as the Commissioners of the Thames, who, besides a large debt, required a large outlay of money to put the river into a proper state?—No. I daresay that we shall spend all the money which we have power to raise in necessary improvements.

4631. (*Mr. Harrison.*) Is there a large area of land in the valley of the Lee liable to be flooded?—I think

that a large area of land in the valley of the Lee from Luton to Hertford may be flooded; Hertford is below Luton. From Rye House downwards there is a large tract of land which might be flooded; the valley widens out.

4632. The trustees have made certain cuts, so that in portions of the valley the navigation is in the channel of the river Lee, and in other parts there are new cuts? —Yes.

4633. Have the trustees any control over the river proper, along which the navigation does not pass?—I claim it under grant from the Crown in the old river.

4634. Then the trustees at present have no power over it?—They have abandoned the navigation. It has never come into question except as a fishing right. I pay a fee farm rent to the Crown.

4635. Do you think that it is desirable that the powers of the river Lee trustees should extend to those portions of the river as well as to the navigable parts of it?—No, I do not see that any object would be gained by it; it is not a matter of very great importance.

4636. Do you not think that if the whole river were placed under their jurisdiction they might be a useful body to carry out works to prevent the flooding of the adjoining lands?—I hardly see how it would be possible, because by the alteration of their locks the river in many places is considerably above the level of the land.

(*Mr. Marchant.*) Each reach might be drained into the reach below. There is a fall of 100 feet between this town and London.

(*Marquis of Salisbury.*) That must be by the purchase of land.

4637. Do you think that the land which is liable to be flooded below Waltham Abbey would be increased in value if steps were taken to prevent that flooding? —If it were my own land I should prefer its remaining as it is. I should prefer pasture land. A great deal of it is Lammas land.

4638. Is not a great portion of it in a wretched state, in an agricultural point of view?—No, I think that they are all very valuable meadows.

4639. Might not they be made more valuable if they were properly drained?—That is a question which I must not venture to answer. I am the proprietor of some land in the parish of South Mimms where the Mimms' wash runs through; it is a celebrated place where water runs over two or three times in the course of a week and disappears into chalk-pits, and it makes the most valuable land on the farm.

4640. In the valley of the Stort, and in the valley of the Lee itself, in passing up and down the railway, I see large areas of land covered with rushes?—That may be. I do not deny it at all.

4641. Surely that land could be improved. Is it generally considered that the flooding is an improvement to the land?—We consider so, provided that the flood does not last too long.

4642. (*Professor Way.*) Your lordship would like the benefit of the water, but you would like to have it under control?—Quite so.

4643. It is a compulsory flooding at present?—Yes, but it seldom remains on for a month in the course of a year. I should imagine that 3*l.* an acre is a very common sum, and that is the best test of the value of land.

4644. I suppose that a proper treatment of the district would enable you to keep the floods out, and to use them where you wished to do so?—I do not at all mean to say that the land is not capable of great improvement, but there are a great many proprietors.

4645. (*Mr. Harrison.*) If it is capable of improvement, do you not think that any improvements which were made should be made as a whole throughout the entire length of the valley?—I should think it very desirable, but then you must obtain the consent of a vast number of owners, because the greater part of the meadows are let in small portions; some are what are called cow leases, and things of that kind. There is no reason why it should not be done, but it is a great undertaking.

4646. It is undoubtedly a great undertaking, but does not your lordship think that if a trust were appointed for the whole of the river Lee it should embrace the carrying out of the works for such an improvement?—I have not the least objection to it, but I think that Parliament would hardly trust any body of men with the power compulsorily to buy up all the cow leases.

4647. I did not intend that, the point I contemplated was to carry out drainage works for the improvement of those lands, so as to prevent the flooding and to drain the whole valley of the Lee?—I am not prepared to say that it would not be very advantageous so to do, but a general drainage is one of those things which we have tried for a good many years, and we have not succeeded yet.

4648. (*Chairman.*) Of course your lordship is aware that this Commission must report to Parliament, and that we must make recommendations?—Yes.

4649. As Chairman of the Commission I only wish to say that I assume that we shall not be considered as travelling out of our way, if we take upon ourselves to recommend that the river Lee trustees be consulted as to any form of legislation for the future management of the water of the river and its navigation, and the water supply to the metropolis, and the prevention of pollution?—Certainly. It cannot be doubted that we as trustees should be very glad that it should be so.

4650. I asked the question because you might have told me that as trustees you would not trouble yourselves with the pollutions beyond indicting the parties who committed them, and would not take upon yourselves the extra amount of duty, seeing that you were an unpaid Commission, and then we should have had to have looked about and to have made some other form of recommendation?—It is the interest of the whole of this part of the country that every possible improvement should be effected, and we as the representatives of the counties and the residents are the persons who would be most interested in carrying out such improvement.

4651. (*Professor Way.*) But your duties would then be much extended; they would not be for the river but for the whole valley?—Those are matters of detail. I do not think that there would be any difficulty in it.

4652. (*Chairman.*) I suppose that before your lordship expressed any further opinion upon this question, you would say, "Let me see what your report and what your recommendations are?"—Exactly so; but I do not think that there would be any difficulty whatever in obtaining the assistance of all my co-trustees.

4653. Is there anything further which your lordship has to offer to the Commission?—I do not know that there is anything.

His lordship withdrew.

Mr. Alfred H. Jarrett (Hertford) examined.

4654. (*Chairman.*) You are inspector of nuisances for the borough of Hertford?—Yes.

4655. How long have you been inspector?—Since the end of 1862.

4656. What are the principal nuisances which are found within the borough?—Nuisances such as are generally found in towns; nothing particular; foul closets and offensive fæcal matter.

4657. How many waterclosets are there in this borough?—I do not know.

4658. How many common privies are there?—I cannot give you that information.

HERTFORD.

Mr. A. H. Jarrett.

29 Dec. 1866.

4659. Are there more common privies than closets?—I think not.

4660. Have you had complaints made to you as to the foul smells from the sewers?—Several during the last three years.

4661. Have you, yourself, observed any foul smells from those sewers?—I have.

4662. Have you had any complaint of foul smells from the outlet works?—None.

4663. Do you occasionally inspect the outlet works?—No.

4664. Have you ever found the water of the river Lee in a foul state at any period of the year?—I have not, only what is occasioned by the atmosphere and rains.

4665. By being muddy?—By being muddy.

4666. Have you anything to do with the water supply?—Yes, I am superintendent of the water.

4667. What volume of water per day is supplied to the borough?—About 150,000 to 160,000 gallons from the new works.

4668. And what from the other works?—We pump up about 51,840 gallons per day from the old works; that makes a total of 2,201,840 gallons.

4669. What is your population here?—6,769

4670. How many persons take water—We have at present about 500 tenants to the works.

4671. How many individuals will that represent, about 2,500?—I make it about 4,955; there are between 500 and 600 persons who steal the water, who do not pay anything for the water but take it from the public taps.

4672. (*Mr. Harrison.*) Are the taps open to any one to take the water from?—No; they are put in public places, and they are paid for by the owners of property adjacent to them, and no one else has a right to take the water.

4673. (*Chairman.*) If you have 4,900 people supplied by your works, have you any idea how much each individual takes per day?—I should say that each individual consumes from 13 to 15 gallons per day.

4674. If you take 4,900 as the number of persons supplied, and 201,840 gallons as the volume supplied, you are giving more than 40 gallons to each person?

(*The Mayor.*) But there is the watering of the roads.

4675. (*Chairman.*) That is a very small quantity.

(*Mr. Jarrett.*) That is the quantity which is pumped, there are 51,840 gallons which are pumped from the old works, and if the consumption is not equal to the supply, a great portion of it returns down the waste pipe.

4676. Then you go on pumping it to let it run away again, you do not mean to say that?—I do, with reference to the old works, but not with reference to the new. We have no control because the old works are by water power, and there are no great means for storing the quantity of water which we pump.

4677. Therefore you let the waterwheel play with the water, pumping it up and letting it go away again?—We have no storage.

4678. Do you know how many waterclosets you supply?—I do not.

4679. Do you know how many houses are drained in the town altogether?—No, I do not know at present, but I can furnish you with the information at a future period.

4680. (*Professor Way.*) You said that 500 houses were supplied with water, and you put down the inhabitants of those houses at 4,000 odd?—Yes.

4681. That would be an average of more than eight people to a house?—Yes.

4682. Do you think that as many as eight persons live in a house here?—Yes, taking in Christ's hospital; I should take the whole of that establishment to be 600; we supply them with water.

4683. What other large establishment have you?—None.

4684. Taking the 600 off, there are seven to a house?—I should think that it would average that.

4685. Then the people live very closely packed together here?—I should say so usually.

4686. (*Mr. Harrison.*) Do you supply any schools with water?—Only Christ's hospital and the grammar school.

4687. How many lads are there at each of those establishments?—They vary according to the period of the year.

4688. Take the average?—I could not give it to you.

4689. (*Professor Way.*) You said 600 just now for Christ's hospital?—I take the number to be that. I should say that the whole of the establishment of Christ's hospital is close upon 600 people.

4690. (*Mr. Harrison.*) Besides Christ's hospital, do you supply any other large establishment?—Yes, the grammar school.

4691. How many lads are there in that establishment?—I cannot answer that question; I should say between 40 and 50.

4692. Are there any other establishments of the same sort which you supply with water?—No.

4693. Do you supply the union?—No, the union is out of the borough.

4694. What is the character of the sewerage works which you have carried out?—Principally in drainage, for draining the houses.

4695. Connecting houses with the main sewers formed by the New River Company?—Yes.

4696. You have not made any new sewers?—We have not done so ourselves.

4697. (*Chairman.*) Have you any further evidence to give?—No.

The witness withdrew.

Mr. W. Wilds.

Mr. William Wilds (Hertford) examined.

4698. (*Chairman.*) You are surveyor to the corporation of Hertford?—I am.

4699. How long have you been their surveyor?—About 12 years.

4700. You are also surveyor to the paving and lighting commission?—I am.

4701. Is that distinct from the corporation?—Yes. A part of the members of the corporation are *ex officio* commissioners on the other board.

4702. What do your duties consist of?—I merely take my orders from the mayor, and am chiefly employed upon the buildings belonging to the corporation.

4703. What buildings belong to the corporation?—The Corn Exchange and some other trifling property, and the old waterworks and the new waterworks.

4704. Have you anything to do with the cleansing of the ashpits and middens?—No.

4705. Do you know what number of waterclosets there are in this borough?—No.

4706. Do you know what length of sewerage and drainage has been laid down?—No. The main sewer was laid by the New River Company under their Act, and they were empowered to intercept all old drains, and to cut them off from any connexion with the river.

4707. Do you, as surveyor, devise and execute any house drains?—I am sometimes employed in my private capacity, but not by the corporation.

4708. When any persons want to drain what do they do?—They give notice to the New River Company's agent; they are bound by the Act to give 24 hours notice.

4709. Then are they allowed to break down and to connect with the sewer?—Yes.

4710. Is there any person to see that they make a proper connexion?—Yes, the superintendent at the deodorizing works attends to that matter on the part of the New River Company.

4711. Do you look after the highways and streets?

—For the commissioners of paving I survey the foot pavements, but I have nothing to do with the roads.

4712. Who manages the roads?—The stone wardens.

4713. What salary have you?—25*l.* a year from the paving commissioners, and I have no standing salary from the corporation.

4714. How do the corporation pay you?—They pay me the usual fee as an architect and surveyor.

4715. You are an architect in private practice, but you act as their surveyor when they choose to employ you?—Exactly so.

4716. Do you know the outlet works?—I have never been down to them since they were established. I have certainly been on to the ground at the beds, but I never examined the outlet.

4717. (*Mr. Harrison.*) Have any sewers been constructed in Hertford under your directions?—Yes, but very few, and to a very small extent.

4718. Discharging into the main sewers constructed by the New River Company?—Yes.

4719. Have you ventilated those sewers?—Not at all.

4720. Do you know of any others which have been constructed by the parish authorities beyond your district?—Yes, I have known others constructed, but I never knew any instance where private or lateral drains have been ventilated in any way; they have generally been trapped so as to prevent any escape of the effluvia.

4721. So that the only outlet of the gases from the branch sewers, as well as from the main sewers, is through the gully holes of the main sewers?—Exactly so.

4722. (*Professor Way.*) Are we to understand that the New River Company have not only made a main sewer, but that they regulate the connexion of the district sewers of the town with their main sewer?—The only way in which they interfere is that they require 24 hours notice, and the superintendent generally attends about the time mentioned for connecting the private drain with the main sewer.

4723. After connection, do the drains of the town come under the jurisdiction of the corporation?—No; the street drains are under the management of the stone wardens or parish surveyors.

4724. They are not under the corporation?—No.

4725. After the drains are made and connected, do the New River Company exercise any jurisdiction?—Only with the main sewers, and not with the side drains.

4726. But they require notice of the making of the side drains?—Yes.

4727. And after that their power ceases?—Yes.

4728. (*Chairman.*) Have you anything further to add?—I do not know that I have, except that with regard to the main sewers several complaints were made, and about two years ago I was ordered to devise means of flushing them, which I did, and I reported to the corporation, but it was thought too expensive, and was not carried out.

4729. And therefore they endure the nuisance instead of flushing those sewers?

(*The Mayor.*) There has been flushing with an immense quantity of water.

(*Mr. Wilds.*) They have been flushed from the hydrants, but my proposal was to throw in a large body of water at the end of the main sewers.

The witness withdrew.

Mr. John Glass (Enfield Lock) examined. *Mr. J. Glass.*

4730. (*Chairman.*) What are you?—I am traffic manager for the River Lee Trustees.

4731. How long have you been their traffic manager?—For the last 14 years. I have been connected with the river Lee trust for 27 years.

4732. Is the traffic upon the river a growing one?—It is very much so.

4733. Has it been a growing traffic in spite of railway competition?—It has.

4734. Have the railways at all tended to diminish the traffic on the Lee?—To some extent they have upon some articles, but it has increased upon others.

4735. In what has the traffic diminished?—Principally in coal.

4736. And in what has it increased?—In building materials, and grain and malt; grain of every description.

4737. Is that because you give better accommodation than the railway can give to take the articles nearer to the place where they are wanted, and so nearer to the place where they are to be removed from?—Yes; and because we can do it cheaper in very large quantities.

4738. Have you any written statement which you can put in of the progressive increase of the traffic, and the income from that traffic?—I will put in a statement for the last eight years, showing the amount of tons charged and the amount of tolls collected.

4739. This is a statement of traffic on the river Lee during the last eight years. In 1858 you carried 254,269 tons, including 22,171 tons of manure, and received 8,104*l.*?—Yes.

4740. And the last year, 1865, you carried 373,357 tons, including 23,896 tons of manure, and you received 10,431*l.*?—Yes.

4741. In 1862, which was a maximum year, I find that you carried 474,630 tons, including 119,111 tons of manure, and that you received 10,526*l.*?—Yes.

4742. It would appear that the excess of tonnage there had been in something which did not pay very much, for there is not a difference of 100*l.* between the amount received in that year and the amount received in 1865?—Just so.

(*The Mayor.*) That was manure.

4743. (*To Mr. Glass.*) And the carriage of manure was stopped after the cattle plague set in?—Yes. In the year 1862 large buildings and works were going on in the neighbourhood of Homerton at the East London Waterworks, and that caused a great increase at that point, but this year the amount of tolls received will be considerably more than in 1862.

4744. From what will that arise?—The general increase of traffic; there is no one particular thing; there are building materials of every description and also materials for brick making.

4745. Do you, in the course of your occupation, go much up and down the navigation?—Constantly.

4746. In what state should you say that it is now as regards the banks, and the locks, and the waterway?—Very good.

4747. Have you anything to do with the dredging?—Yes, a great deal; we realize a considerable profit by the dredging.

4748. Have you charge of the dredging operations?—Yes.

4749. Have you had occasion to complain of any pollutions poured into the navigation at any particular points?—That perhaps would be a matter more for the engineer; so long as the water is sufficient to carry the barges up and down I do not interfere much about the quality of it, unless there is any obstruction in the navigation.

4750. You think that dirty water will carry coals as well as clear?—Exactly.

4751. Has the water been at all offensive to you at any time?—Not above Tottenham.

4752. But below Tottenham?—Below Tottenham, very much so.

4753. That is below where the East London Waterworks Company takes its water supply?—Yes.

4754. (*Mr. Harrison.*) As to the traffic upon the

HERTFORD.

Mr. J. Glass.

19 Dec. 1866.

canal, is that traffic which you have given in distributed throughout the whole length of the canal?—Throughout the whole length of the navigation from London to Hertford, beginning at Limehouse cut, Bromley, Old Ford, part of Homerton, Lee Bridge, Clapton, Tottenham, Edmonton, Ponder's End, Enfield lock, Waltham, Cheshunt, Broxbourne, Hoddesdon, the river Stort navigation, Stanstead, Ware, and Hertford, and at all those places there is an abstract showing the different articles carried, ashes, breeze, chalk, sand for brick making, coals and coke, building materials, cement, stone, iron, and timber, gravel, linseed cake and oil, and linseed for making the cake, barley, and oats. Immense quantities of barley are taken up to be converted into malt. Wheat is taken up to the mills and ground, and sent back again as flour. Flour is carried both up and down; flour is brought from the mills, and foreign flour is carried up in casks. Beans, peas, tares, and every description of grain are carried. Immense quantities of malt are carried, last year there were 26,653 tons of malt carried from Ware only; that multiplied by eight would give you the number of quarters.

4755. (*Professor Way.*) Is that at 1*s.* 3*d.* a ton?—At 1*s.* a ton.

4756. (*Mr. Harrison.*) Besides the traffic to those places which you have mentioned, do you afford accommodation for mills and wharves in between?—Yes. The mills at Hertford keep barges (I am speaking of the flour mills), and they convey the wheat up and grind it, and send the flour again to London in a barge.

4757. Do you know of any railway of the same length with accommodation to such an extent as is afforded throughout the length of the river Lee?—There is nothing like it I should think on any railway in England.

4758. (*Chairman.*) What is the difference between breeze and ashes?—The ashes are the sifted material and the breeze is the coarse material.

4759. Then the breeze is just as you get it from the ashpits in London?—It is the coarse parts sifted from the ashes; the breeze is used for burning the bricks, and the ashes are used for mixing with them, when they make them; the fine part of the ashes is mixed with clay in making the bricks, and the breeze is put into the stack to burn them.

4760. When the dustmen cart the mass from the London dustbins, what would you call it?—The dust.

4761. When you have sifted it the one portion is called breeze and the other is called ashes?—Yes.

4762. The fine portion is called ashes?—Yes.

4763. And the coarse portion is called breeze?—Yes.

4764. (*Mr. Harrison.*) Is the return which you have put in a return for a twelvemonth?—Yes.

4765. (*Professor Way.*) It gives 373,000 tons for the year 1865?—Yes.

4766. That is in both directions, up and down?—Yes.

4767. (*Chairman.*) Can you give us a copy of that return?—I will do so. (*The witness subsequently furnished to the Commissioners a copy of the return, which will be found printed at the end of his evidence.*)

4768. (*Mr. Harrison.*) Do you find that manufactories are being established on the banks of the navigation in consequence of this accommodation which you can give them?—Very much so. In the case of any new factories established in the suburbs of London the parties generally apply to the trustees of the river Lee navigation for land on which to erect the factories.

4769. How far from Bow creek up the navigation does the establishment of factories extend?—To Ponder's End, about nine or ten miles.

4770. Therefore any interference with the navigation would not only injure the property of the navigation but would seriously injure a considerable amount of property on the bank?—Yes; the property established on the banks in old and new factories and warehouses and malthouses is immense; that property is far before the property of the trustees.

4771. When you carried the manure, before the cattle plague broke out, did you find it pretty equally distributed throughout the length of the navigation?—We put all the restrictions which we possibly could upon the manure as far as the law would allow us. We prevented its being landed on the trustees property or across the towing-path, but still a certain amount was carried up which we could not prevent; it was taken up the back rivers. I am speaking of the time during the cattle plague.

4772. Generally speaking, apart from the cattle plague, you do not discourage it?—No.

4773. Is it distributed upon the navigation right and left throughout the whole length?—It generally begins about Ponder's End and goes all the way up to Hertford to different points, Ware and Stanstead, and many parts between the towns, where the agriculturists have land; they bring a barge alongside and carry it at once upon their land; that is the case up the Stort.

4774. Then that is a very great accommodation to the neighbourhood?—Yes; in many places they would not be able otherwise to get it upon the land at all; it is too marshy to cart it.

4775. (*Professor Way.*) I see that last year you carried altogether 349,000 tons of the articles given, and 23,000 tons of manure besides that?—Yes.

4776. These 23,000 tons compared with 349,000 tons of other articles, make about one-sixteenth of the whole, which goes without charge?—Yes. I was going to enumerate the different towns where factories are established on our banks. At Enfield lock there is the large gunmaking establishment, and at Waltham Abbey there is the government powder establishment; they keep barges of their own, locked up barges, in which they send their powder to their stores at Purfleet.

4777. Do they pay you any rate?—Yes, they pay for it, but they could not send their powder except by water; it would be dangerous to the public.

4778. Do they pay you an exceptional rate for it?—They pay the highest rate which we can charge, which is 1*s.* 1*d.*

4779. (*Chairman.*) Is it your duty to make yourself acquainted with the rates charged by the railway company, and to advise your principals of what rates are current in the district for the different kinds of goods?—No, we are not carriers; the railway company are carriers.

4780. Who are the persons generally who carry upon your navigations, are they carrying companies, or proprietors owning their own barges?—Most of them own their own barges; a great many in the lower part of the district are principally lightermen, who have barges of their own, and who work by the job.

4781. Lightermen are persons who may possess from one to a hundred of these lighters or barges?—Exactly so.

4782. And they navigate the Thames as well as the river Lee?—Yes.

4783. And they take up and put down cargo according to their own freightage scale?—Yes.

4784. How do you ascertain the tonnage which they carry?—By gauging; the system is the same as is in operation on all the inland canals, such as the Grand Junction canal, and the Regent's canal.

4785. Do you compel them to have a floating gauge plate, which you can read, on the stem and stern?—No, it is in a different way; we have a gauging rod which we put on the side of the barge, which shows the number of dry inches, that is to say the number of inches from the gunwale of the barge to the water's edge. First of all we have a table made, and according to the number of dry inches and decimal parts, we find the tons by the table.

4786. The boats are registered to carry according to the depth and draught, and you ascertain the draught, and accordingly register them for the tonnage?—Yes.

4787. So far as your knowledge goes, do you think that that is a pretty fair way of ascertaining the tonnage?—It is the most correct mode that can possibly be adopted.

4788. Can you get the tonnage of a 100 ton barge within 5 tons?—Within 5 lbs.

4789. (*Mr. Harrison.*) As each new boat is introduced on to your navigation, do you put it on to a lock or pound, and load it, and see what depth it draws with each additional foot?—We do not take the depth of water, but we take the dry inches, because the depth of water is liable to fraud by putting on pieces at the bottom to make it appear deeper, and it is not always in view. We first of all put on four plates; we measure the extreme length of the barge, and then take the stowage, and divide the stowage into four, and put four plates on, two on each side. We take the dry inches before we put anything into the barge, and according to the size of the barge we have regular weights, 2 cwts. each, which we put in until we have loaded her down to 60 tons, or as deep as is necessary, and then we make a table. A copy of that table is sent to all the collectors on the navigation, and by that means we get at the tonnage as correctly as anything can be got at.

4790. (*Chairman.*) If you measure by tens of tons, the intermediate space for decimals of tons you divide into decimal parts?—Yes.

4791. If it was 4 feet 3 inches and $\frac{1}{10}$th you would know exactly what it meant, although you had not measured the tenth in the arrangement?—If we put in 8 tons we should see what the difference was, and should then divide it by 8. We find that the barges sink from 45 $\frac{1}{100}$ths to about 55 $\frac{1}{100}$ths of an inch to a ton.

4792. (*Mr. Harrison.*) I suppose that you feel the effects of competition through the haulers; if they find that they are losing their traffic by the railway company lowering their rates, they will come to you and let you know, and ask you to reduce your rates?—Yes; it is our interest as much as possible to co-operate with the traders.

4793. (*Chairman.*) Have you anything to do with the maintenance of the banks?—That is more a question for the engineer.

4794. And for the bank manager?—Yes; I have to do with that matter, but it is under the direction of the engineer.

4795. Do you know what is the net income of the trust at present for paying dividend, after paying salaries and maintenance?—No.

4796. (*To Mr. Marchant.*) Do you know whether you have a surplus income, whether you have more than you require, or less than you require?—At the present moment I believe that we have something more of revenue than of expenditure.

4797. (*Professor Way.*) Is that after paying current works out of revenue?—No; we distinguish between ordinary and extraordinary expenditure, that is to say, revenue and capital.

4798. If you have used up your capital, how do you provide for current works except by increasing your debt?—We do not; if we required more money on capital account, we should immediately issue more debentures.

4799. (*Chairman.*) You have not gone to your limit?—We have not.

4800. (*Professor Way.*) You do not use your revenue for new works?—No.

4801. (*Chairman.*) Have you a public audit?—No; we have an auditor appointed, in fact, our deputy chairman, *ex officio* auditor.

4802. Is he appointed by your own board?—Yes.

4803. You have no external authority to which you refer the account?—None.

4804. Do you not think it advisable if you had additional power, that there should be some independent board to whom you should have to refer your audit?—I can quite conceive that if you were to extend the powers of the trust, and to raise funds by means of rating, or any other means, it would be desirable to have a public audit.

4805. That is to say, that your accounts should be submitted to an independent authority, such as the Board of Trade?—Yes.

4806. And that persons who considered that they were interested, should have the power of making an examination?—I may say, that the accounts are public to this extent, that if any person interested in the navigation desired to have a copy of our accounts, or to look at our books, we should not hesitate for a moment in letting him do so; for copies he would have to pay to the clerk the charge which is mentioned in the Act. The accounts are, therefore, public to that extent.

4807. Then you have a provision in the Act by which any person directly interested in the navigation can ask to have a copy of the accounts?—Yes.

4808. (*Professor Way.*) He could demand it, at all events, he could get an order from the Court of Chancery to see the accounts?—Certainly. We have always an annual meeting in the city of London, at which the accounts are passed, and a statement is placed before the trust.

4809. (*Chairman.*) Your trust is composed of such a variety of interests, that in fact, it amounts to a public audit, because you have so many interests involved in the constitution of the trust?—That is so, the trust is, in fact, essentially a public trust; it is a public commission, the members of that commission being chosen from the localities of the different counties and boroughs through which the river passes.

4810. (*Professor Way.*) There is nothing to prevent us from getting a statement of your receipts and disbursements for the last 10 years?—Certainly not.

4811. (*Chairman.*) Are your annual accounts published, and is a printed copy submitted to each member of the trust?—Not as a rule, but if a member asks me for a copy I gave it to him, they are not sent round as a rule.

4812. You do not necessarily publish and send round the accounts?—No. For instance, there may be *ex-officio* members who have not attended the meetings for a considerable period, and we do not take the trouble to send the accounts to a gentleman who takes so little interest in the affairs of the trust, and the result of our operations; but if any member should happen to write to me for a copy of the accounts, it is sent to him immediately.

4813. (*Professor Way.*) Will you let us have a copy of your receipts and disbursements for the last 10 years?—Certainly.

4814. (*Chairman to Mr. Glass.*) Have you anything to add to your evidence?—Not that I know of, except that I wish to show that the river Lee navigation is a greatly improving navigation, and will be year by year increasing in every direction, and for this reason, namely, that London is spreading out far away, and getting towards the nearest mode of conveyance of heavy materials for building and so on. The trustees have a large quantity of land on the side of the navigation at the marshes at Homerton, in a few years that land will be all built over with large factories, which will be increasing the traffic upon the navigation. Within the last 12 or 14 years the trustees have been improving the navigation and laying out an immense sum of money in widening the locks, so as to admit barges of a larger capacity from the Thames which could not come up before, also barges which travel on the Regent's canal where the locks are wider than

HERTFORD.

Mr. J. Glass.

19 Dec. 1866.

ours. Barges of any width which traverse the Thames are now enabled to come up to those lower points where these manufactories are likely to be established. I may add that I find that at Ware and Hertford the malting trade is gradually and progressively increasing.

4815. Have you any pleasure boats upon the river in any portion of its course?—Yes, we have a great number of pleasure boats down below Tottenham.

4816. Do they pay any rate to the trustees?—Not unless they come through the lock; some of the owners of these boats pay a small sum per annum for the privilege of keeping their boats over a certain area near the towing-path, so that they should not be interferred with by others.

4817. Have you any idea what number of pleasure boats ply upon the river in the different branches?—I should think that there are 500 or 600 pleasure boats.

4818. Seeing that you have to maintain the river, should you think it any hardship if you had the right of putting a rate of 10*s.* or 1*l.* a year upon the pleasure boats?—Wo do that to a certain extent in the cuts, and I think that it would be a very excellent thing if we had power to do so on the old river between Tottenham and Lee Bridge, for those boats are a very great nuisance.

4819. You think that a person who could afford to keep a pleasure boat would not object to a moderate payment?—No.

4820. It might be a great advantage to you and might enable you to keep the river in a better condition?—Yes. They always pay for passing through a lock. They do not keep the pleasure boats for their own use, but they keep them for hire.

4821. In that case do you not think that it would be fair and reasonable that you should have the power of levying a rate upon them for a licence, an annual or quarterly payment?—Yes.

4822. If you made them take out a licence at 5*s.* a quarter or 1*l.* a year, you would have a small income from them, and it would do them no very great harm, and it would do you some good?—Yes; we do adopt that principle in the cuts and in some places below where they wish to lay alongside our towing-path, we charge them 10*s.* per boat per annum, and it gives us some little control over the matter.

(*Mr. Beardmore.*) There is no doubt that many of those boats are most dangerous and there ought to be a registration of them.

4823. (*Professor Way to Mr. Glass.*) The pleasure boats are an obstruction to the navigation?—They are a very great obstruction below Tottenham. We keep them within bounds above and have a control over them, but below Tottenham, between there and Lee Bridge, they are a very great obstruction.

4824. (*Chairman.*) Have you power to license persons for fishing?—No, we have nothing to do with the fishing.

4825. Who regulates that?—It is regulated by different parties.

4826. Private owners?—Private owners.

4827. According to arrangements which have been previously entered into?—Yes.

4828. Is there anything further which you wish to add?—There is nothing that I know of.

(*Mr. Beardmore.*) The trustees own two or three fisheries which they let.

4829. (*Professor Way to Mr. Marchant.*) Is there any reason why we should not have a return of your income and expenditure. If we are to make any recommendation we must really know what funds you have at your disposal?—It is necessary for me to have authority to give that return, and the only reason why I say that it is necessary for me to have that authority is, that the Act specifies that those persons who are interested in the navigation should have copies of the accounts; if at our next meeting, which will be on the 14th of January, I can get the authority, it will I presume be sufficient for your purpose. (*Mr. Marchant subsequently furnished to the Commissioners copies of Abstract of Accounts of River Lee Trust from* 1856–66. *The Abstract of Accounts for the year ending Dec.* 31, 1866, *will be found printed as Appendix* 3 *to his evidence.*)

4830. We have authority to call for all papers?—Yes.

The witness withdrew.

APPENDIX I. to the EVIDENCE of JOHN GLASS, Esq., Traffic Manager to the River Lee Trust (referred to supra, Q. 4767).

ABSTRACT of TRADE for the Year ending the 31st December 1865.

(Signed) JNO. GLASS, Traffic Manager, R.N.T.

HERTFORD.

Mr. J. Glass.

19 Dec. 1866.

Appendix No. 2 to the Evidence of John Glass, Esq., Traffic Manager to the River Lee Trust.

Rates of Tonnage, Table of Distances, and List of Barge Owners.

The River Lee is navigable for craft coming from the lower part of the Thames and the river Medway at Blackwall, through Bow Creek; and from the upper part of the Thames at Limehouse through the Limehouse Cut to Bromley, Stratford, Bow, Old Ford, Homerton, Clapton, Lee Bridge, Walthamstow, Tottenham, Edmonton, Ponder's End, Enfield Lock, Waltham, Cheshunt, Wormley, Hoddesdon, Stanstead, Ware, and Hertford.

The locks are now calculated to admit barges of 90 feet in length to any point, and of the following width, viz.:—

To any point short of Old Ford lock, 20 feet wide.

To any point short of Ponder's End lock, 17 feet wide.

To any point short of Enfield lock, 15 feet wide.

To all points beyond, and the "Stort," 13 feet 3 inches wide.

Junctions with Canals and Railways.

The navigation is connected with the Regent's Canal through the Hertford Union or Duckett's Canal at Old Ford, opening a direct communication with the Grand Junction and all canals and railways north of London.

It also joins the Stort navigation at Hoddesdon, extending to Roydon, Harlow, Sawbridgeworth, and Bishop Stortford.

In the Limehouse Cut there is a coal shoot where craft may load direct from the North London in connexion with the North Western and other lines of Railway. Also at Hertford, a capacious dock and wharf adjoining the Great Northern Railway.

The navigation is open for traffic at all times, night and day, except Sundays, when it is closed from eight o'clock in the morning until 6 in the evening.

River Lee Trust.—Rates of Tonnage.

Saltpetre and gunpowder	0	4	0	6	0	6	1	1	1	9	0	7	1	3	0	6	1	1

Bricks or spoil, to or from any point, 3*d.* per ton.

Coals, from Duckett's Canal to any point, or from Hertford to the Thames, not to exceed 4*d.* per ton.

Flour (downwards only), not to exceed 6*d.* per ton.

Rough iron ore, from Hertford to the Thames, 3*d.* per ton.

Empty barges, and barges not having paid toll to that amount, 3*s.* each.

Pleasure boats 1*s.* 3*d.* each, to be paid at the first lock they pass through up or down.

Flints, chalk, gravel, sand, roots, vegetables (downwards only), 2*d.* per ton.

Goods that have not paid tonnage will be charged 1*d.* per ton for wharfage, if landed across the towing path.

Barges not paying toll will be worked through the Bow Tidal Lock at a charge of 1*s.* each way.

Pitch, tar, creosote, and gas products, passing through Old Ford only, 3*d.* per ton.

Wharfage, in Hackney Marsh, for all goods except manure, 3*d.* per ton.

Wharfage, at same place, for manure, 15*s.* per barge.

Ware wharf is open free of toll except for manure, chalk, sand, and gravel, &c., which will be charged 2*d.* per ton, and 1*d.* per ton additional for each week or part of a week that the articles may lay upon the Wharf after the first week.

All articles will be charged by the gauge or actual weight o 20 cwt. to the ton.

The above tolls will be charged until further notice.

By order of the trustees,

J. Marchant, Jun., Clerk.

Hertford, June 1865.

Table of Distances between Hertford and the Thames at Limehouse, in Miles.

	Hertford	Ware	Stanstead	Hoddesdon and Stort	Broxbourne	Cheshunt and Wormley	Waltham	Enfield Lock	Ponder's End	Edmonton	Tottenham and Walthamstow	Lea Bridge and Clapton	Homerton	Old Ford and Duckett's Canal	Stratford, Bromley, and Bow

Limehouse	32	29	26	24	21	18	16	14	12	10	8	5	3	2	1

The distance from the mouth of Bow Creek at Blackwall is about one mile further than from Limehouse; and the distance on the Stort navigation from its junction with the river Lee at Hoddesdon to Bishop Stortford is 13 miles.

Mr. Alfred Manser (Hoddesdon) examined.

4831. (*Mr. Harrison.*) Where do you live?—At Hoddesdon, on the Lynch, which runs into the Lee.

4832. Do you carry on any occupation there?—I am a miller, a barge owner, and a coal merchant.

4833. Have you more than one mill?—I have two mills, one on the Lynch and the other on the Lee.

4834. Of what power are those mills?—At one mill we have a guaranteed power of 4,000 cubic feet of water per minute.

4835. Which mill is that?—That is the one on the Lee.

4836. What is your fall there?—5 feet.

4837. What is it at the mill on the Lynch?—12 feet.

4838. Does the water originate with you?—It springs on our own premises.

4839. Have you found any difference in the volume of water discharged from that spring of late years?—I have not measured it.

4840. You have not found any sensible diminution in the power of your waterwheel?—No, I cannot say that I have.

4841. It was mentioned to us at Bishop Stortford that in many cases the water power had considerably diminished. Your mills are flour mills?—Yes.

4842. Do you use the navigation for carrying your corn and flour?—Yes, almost entirely.

4843. Do you find it a convenience?—A very great convenience; the rail would be very inconvenient to me, I could not work with it.

4844. So that any interference with the navigation would be a decided disadvantage to you?—It would make the mills comparatively worthless; at one mill I should be three miles from the railway station.

4845. How far are you below Ware?—We call it four miles. Charlton mill is the first mill below where the Stort enters.

4846. Do you find any nuisance arising from the waters of the Stort, or of the Lee?—No; our foreman at the Charlton mill cottage always uses the Lee water for drinking and cooking, and so they do at the "Fish and Eels" public-house.

4847. Without filtration?—Without filtration. I do not think that our foreman has a filter. I drink the water myself, occasionally.

4848. Do you see much difference between the water now, and in former years, as to its purity?—I do not think that it is quite so pure as it was; that is speaking of above me as far as it comes down to me; below it certainly is not so clear.

4849. The benefit of the navigation to yourselves would be equally felt by millers situated upon the river, and other persons, throughout its length?—Yes, maltsters and millers, seed crushers, and every one. I consider it of very great value; in fact, it is that which makes Hertford, and Ware, and Waltham Abbey what they are.

4850. You think that the railway will not do for those towns what the navigation does?—No, certainly not. In my own case I can get a sack of flour conveyed by the navigation for 3*d.*, if I send it to the rail I must pay 6*d.*, and I must first get it to the rail.

4851. Have you any steam power?—No, there is a steam engine put up by the New River Company to make up the quantity of water which they have to supply in dry seasons; they have to supply us with a certain quantity of water, or to forfeit 10*l.* a day. We have to give them notice.

4852. When was that engine erected?—I think in 1855, just after the last Act.

4853. In how many instances have you had occasion to call upon them to use it?—That has been the case most years; it was so in last year, and the year before. I should think that it has been at work eight years out of ten.

4854. In 1864 for what length of time was it used?—I think that it was at work about two or three months.

4855. And in 1865?—About the same time. In 1864 I think that it was at work three months, and in 1865 two months.

4856. Of what horse power is it?—They call it, I believe, 40-horse nominal power. The engine pumps the water. They have centrifugal pumps; we would not allow them to put it up at the mill. The New River Company were to provide a certain quantity of water by pumping or otherwise, and we said, "Provide it by pumping."

4857. You would rather have a regular steady action of the waterwheel than steam power?—Yes, decidedly.

4858. (*Chairman.*) They pay 1*s.* every time they pump for nine pennyworth of power?—I believe that if that engine was worked up to 45-horse power it would only do about 8-horse power of work; they lose 10*d.* out of the 1*s.*

4859. Or more than that?—Yes.

4860. (*Professor Way.*) Would it not seem the most reasonable way for you to take some compensation?—We fought it out rather hard and we died hard.

4861. (*Mr. Harrison.*) What is your opinion as to the value of the navigation for the powder works, and the small-arms factory?—I do not think that the powder works could be carried on without it. The way in which they manage is to work small boats upon the cuts, and they take the charges to the various magazines, so that it is not necessary to use a cart or a truck; there is no friction and no danger, and as soon as they have 500 barrels of powder it is sent away to Purfleet.

4862. (*Chairman.*) They can isolate themselves?—Yes.

4863. (*Professor Way.*) They were put there for the very purpose of that being the mode of transit to the depôts?—Yes.

4864. (*Mr. Harrison.*) How do you think that the present river Lee trust works for the benefit of the public?—I think that it worked better when there were a greater number of men of business upon it.

4865. (*Chairman.*) Is there anything to prevent your being a member of the trust?—No, if I choose to qualify; you must have a certain amount of income derived from freehold property.

4866. (*Mr. Harrison.*) Is there any exclusion of millers from the trust?—No, I should have qualified, but I do not quite like the way in which they manage things.

4867. Would not the best thing for you to do be to get on the board and induce them to manage better?—I very much doubt that. I am the secretary of an association which has been formed, to endeavour as much as we can to keep them in their places.

4868. (*Mr. Harrison.*) How does that association act upon them?—I think that, for instance, in the case of the Regent's Canal Bill, which was brought forward two years ago, it acted beneficially; it stirred them up, and pushed them forward to do their duty.

4869. How is it that the men of business are not upon the board now?—Some years ago there was a great change in the management of things. A vice-chairman and a great number of county gentlemen were introduced, and it did not appear that there was that amount of attention paid to the wishes of men of business which there had been, and consequently I think that in most cases they declined to attend and others declined to become fresh members. We have no court of appeal; for instance, if I went to-morrow and said, "So-and-so is wrong," it is possible that I might be heard, and in all probability I should be heard, but in the event of my not getting any redress there would be nowhere for me to go.

4870. (*Chairman.*) Then do you think that there should be some superior board to whom you could appeal?—Yes, I think that if there were two or three commissioners before whom we could lay any case of complaint, in case we could not obtain redress from the board, it would act extremely well.

4871. Do you think that if the trust was to be

HERTFORD.

Mr. A. Manser.

19 Dec. 1866

extended in its operations into a conservancy board, the Government in granting that power should place some sort of check or control, or should establish a court of appeal to which persons thinking themselves in anyway aggrieved could have recourse?—Yes, I think that there should be a superior board.

4872. (*Professor Way.*) But I take it that you would not like the present trust in any form unless it was considerably modified by the admission of a large business element?—I think so.

4873. (*Mr. Harrison.*) Is the Regent's Canal Company much interested in the Lee navigation?—As a navigation I do not think that it is now, because the communication was cut off two years ago, that is to say, the communication between the Regent's canal basin and the Limehouse cut; it was cut off at the Coffer dam in consequence of their losing their bill, and having to give up property which they had held for many years, they held it for 12 years, and we got it away again.

(*Mr. Beardmore.*) A very large traffic is carried on from the Regent's canal through Duckett's canal.

4874. (*Chairman to Mr. Manser.*) Have you ever preferred a complaint which the trust has not dealt with?—I have.

4875. What was that complaint, and when?—It is now a good many years ago; it was with regard to the reconstruction of a weir, and its water-marks.

4876. Has it not been reconstructed to this day?—It was reconstructed, but I did not get what I wanted. I had no appeal; the matter was not fairly gone into to say whether I was right or wrong; the thing remained in *statu quo.*

4877. The trustees had power to deal with it in their own way, and you think that they did not consult your interests?—Yes, but I do not make a charge against them, that is not my object.

4878. (*Mr. Harrison.*) Do you admit the general statements which we have had given in evidence to-day, namely, that under the present management and since the passing of the Act in 1855, the canal has been much improved, and the locks have been made good, and the canal has been deepened so as to take barges of nearly 100 tons instead of 40, and that accommodation is given so as to encourage an increase of the traffic to a very considerable extent upon the navigation?—I believe so in every respect. I am perfectly satisfied with it, so far as regards the actual improvement of the navigation.

4879. Therefore so far as the substantial interests of the public are concerned, the present trust appears to be working well?—Yes, so far as the public are concerned.

4880. Would your complaint be an individual one?—I think that if they paid more attention to economy and exercised more care, and if instead of borrowing a large amount of money and raising these debentures, they endeavoured to be careful to improve the river out of income, which they might very properly do, it would be very much better.

4881. Do you think that if they had confined their attention to doing works of that kind, you would have had the benefit of the present improved navigation?—We perhaps might not have had it quite so quickly, but still it is progressive.

4882. (*Chairman.*) Within the last two years, did not a memorial proceed from the association, of which you are the acting secretary, and was it not sent to the river Lee trustees, begging them to reconstruct the Limehouse entrance, it involving an outlay of something like 15,000*l.*?—Yes, but I do not think that it was necessary that they should borrow the money, because I think that if greater economy had been practised for 10 or 12 years previously, that money would have been saved, and need not have been borrowed.

(*Mr. Marchant.*) We are not enabled to create a surplus capital fund. If we had a large fund in hand applicable to such a purpose, as the memorialists requested of us, we should have to reduce our tolls. We must improve the river from year to year; we cannot make a fund for 20 years, which shall repay a possible expenditure 20 years hence. If any extraordinary work, such as that of the Limehouse entrance, is forced upon us by an association, or by extensions of business, we must borrow the money by the powers of the Act.

4883. I presume that the association in their application to the Lee trust, represented what the trade required, or the trust would not have been coerced into making that outlay?—There was no coercion. When the trade represent such a matter to us we carry it out if it is needed. This memorial was a recommendation; it was not antagonistic to us at all.

4884. (*Mr. Harrison to Mr. Manser.*) Do you know the condition of the land in the valley of the Lee, below the point where your mill is?—Yes.

4885. Is it liable to be flooded much?—Yes.

4886. Is it injured or benefited by the floods?—I should think that it is not injured. I think that the water down below in the lower part of the river is so very foul, that it manures that land rather than otherwise.

4887. Does it lie for sometime upon the land?—Generally a day or two.

4888. It lies for so short a time that it does not injure the land from the water becoming stagnant?—No; the weirs for passing off the water are better than they used to be, so that the water is passed off more quickly. Those weirs I think are all under the control of the trustees. Mr. Beardmore has introduced an iron weir in place of a wooden one, so that his posts are perhaps 6 or 7 inches instead of 14, and that increases the difference in waterway.

4889. Then that is a benefit to the neighbourhood which must be carried to the credit of the trustees of the navigation?—Yes, I will give them full credit there.

(*Mr. Beardmore.*) The improved getting off of the water is due as much to the dredging as to the other works.

4890. You have deepened the reaches?—Yes.

4891. (*Chairman.*) You have increased the sectional area through which the water can pass?—Yes.

(*Mr. Manser.*) And they have raised the banks a little.

(*Mr. Beardmore.*) The sectional area in shoal places is now at least double.

4892. That would give more than double the volume of water in the same time?—Yes; the hydraulic effect as you are aware is very much larger. I should think that it is pretty nearly eight times.

4893. (*To Mr. Manser.*) Is there anything further which you wish to bring before the Commission?—Nothing, I think, except that I do hope that any recommendation which you may make may lead to some higher power being appointed to control the acts of the trustees, and to give us justice when we seek for it.

The witness withdrew.

Mr. F. Haggar.

Mr. Franklin Haggar (Hertford) examined.

4894. (*Chairman.*) What are you?—A seed crusher and flour miller.

4895. Are you a trader having goods carried upon this river?—Yes.

4896. (*Mr. Harrison.*) Where are your mills situated?—One at the north end of the town of Hertford and the other at the west end.

4897. What power do you use for crushing?—Steam and water at one mill and only water at the other.

4898. Is your water power regulated in the same way as Mr. Manser's is?—No.

4899. Have you the control of the whole of the water of the Lee?—We have the control of the whole of the water which passes down the Lee and the

Beane. One mill is on the Lee and the other is on the Beane.

4900. Have you experienced any diminution in your power on the Beane?—Previously to this year we had a considerable diminution, consequent, I imagine, upon the small quantity of rainfall in the eastern counties generally; but this year we have had an abundant supply of water.

4901. Situated as you are at Hertford, with two railways working competitively, and the navigation, do you find that the navigation of the river Lee is a benefit to you?—I am quite certain that we should be very much worse off without the navigation; it is most desirable that it should be maintained in its present efficient state.

4902. Do you convey your goods much by the navigation?—I do not convey a great deal by the navigation because I have railway communication into one mill.

4903. Have you equal accommodation to the canal?—Yes; I can carry goods either to the river or to the railway.

4904. Were you in business here before the construction of the railways?—Yes.

4905. Do you find that you have your goods carried now at a cheaper rate than you had before the railways were constructed?—I find that I have the goods carried cheaper by railway than I had by the river.

4906. And cheaper than the river would carry them now?—Yes.

4907. Do you use much coal?—I use a large quantity of coal at the seed-crushing mill.

4908. By what conveyance do you get it?—We get it direct from the north by railway into the mill. Neither of my mills is on the navigation. I have similar accommodation, inasmuch as I can carry either to the rail or to the Lee river by land.

4909. But you have not the navigation coming close up to your mill?—I have not.

4910. You get your coal direct now from the north?—Yes.

4911. Do you get it at a lower price now than you did years ago?—I had not the mills before the railway was made, at least I had not the steam power; I had the mills but not the steam power.

4912. Is either of your mills situated below the point of discharge from the works for the purification of the sewage?—They are situated above the point of discharge.

4913. Do you find that there is any silting up in the river below your mill?—Very considerable indeed.

4914. Is it more than it used to be in former years?—I do not think that it is more than it used to be, but it is very considerable; it is getting into a very bad state indeed now.

4915. Is that below your tail race or within the navigation?—It interferes with our tail water.

4916. Is a bank formed in the tail race or in the navigation?—Not in the navigation but in the tail race, before it joins the Lee.

4917. Whose duty has it been to remove that obstruction?—I and my father before me removed it for many years, and we have commenced to remove it this year; we have taken out a large quantity, when the question has arisen as to who is entitled to the accumulations taken out of the river and thrown on to the bank; that is the question in dispute at the present time.

4918. Is it of value?—Yes.

4919. That which is an obstruction to your mill by damming up the water is really a benefit and worth taking out of the river?—Yes; but it is not worth more than the expense of taking it out. What we have to pay to take it out is about the value of it.

4920. Who disputes with you the right of taking it out?—It is not the right of taking it out.

(*The Mayor.*) We dispute your right to excavate the bed of the river.

(*The witness.*) I concede that the corporation have a right to the bed of the river, but I claim a right to take out the accumulations of soil.

(*The Mayor.*) You have done more than that.

4921. (*Professor Way to the witness.*) Supposing there is an impediment and it is removed for the purpose of obtaining power, when it is got out it may be of some value, although not equal to the cost of getting it out, then a dispute may arise as to who is to have it when it is got out?—Yes, that is the question.

4922. The dispute does not arise before it is got out?—(*The Mayor.*) Yes, we dispute it; but it appears to me that it is not a question for us to decide now, the right of Mr. Haggard to do what he has done. The fact is that he has excavated down to too great a depth; he might clear away the accumulations, but not the bed of the river.

4923. (*Mr. Harrison to the witness.*) It appears that your right to remove an obstruction is not disputed, but that your right to dredge for gravel is disputed. How many years have you known the river Lee?—All my life.

4924. What is its condition now as compared with what it was formerly?—The navigable river Lee is very much improved as a navigation certainly.

4925. What is its condition as to purity?—As to its purity it must be more pure of course as the sewage of the town of Hertford does not pass into it.

4926. Do you frequently find that dead animals are passed down the river?—Yes, dogs and cats are to be seen passing down the river.

4927. What do you do with them when they are stopped at your mill?—We pass them on.

4928. That appears to be the general practice?—We could not undertake to take them out. They come down to us and we pass them on. The river Lee above Hertford is getting into a very bad state; it is being silted up very much, and I am satisfied that the river in places is quite a foot higher than it used to be above the town of Hertford.

4929. Is the river above the point where the navigation commences under any control?—None whatever, I believe.

4930. To whom does it belong, the owners of the adjoining property?—Yes; the owners of the adjoining land have the right of fishing, and I daresay they would not let anyone come to clean it out.

4931. Are there any mills above you?—Yes, but between my mill and the mill above there is a fall, an ordinary fall in the bed of the river, which is not appropriated.

4932. The bed of the river, you think, has risen a foot within your recollection?—Quite so.

4933. Has the effect of that rising of the bed been to flood the land more than it used to be?—I have no doubt of it.

4934. Is the land in fact flooded more than it used to be in your recollection?—I should say so certainly.

4935. How far up the river does the flooding extend?—I should say for three or four miles.

4936. How far up the river is the next mill above Hertford?—The next mill above Hertford is about four and a half miles.

4937. Above that point does the miller take steps to keep the channel deep?—I do not think he does, as there is this natural waterfall that I speak of, and he is not affected.

4938. Has not the raising of the bed of the river affected the water at his mill-tail?—I think not, because of this fall, which is below his mill-tail, and it is not affected by it.

4939. What is the condition of the land adjoining the Lee above Hertford?—It is principally meadow land in the valley of the Lee.

4940. Is it in good condition?—I should say that it is generally very wet. There is land adjoining the town, or within a mile, that it is not possible to walk over; there are some acres together.

4941. Do you not think there ought to be some control over the river above Hertford to prevent the silting up of the land?—Yes, certainly.

4942. (*Professor Way.*) You are a seed crusher, are you not?—Yes.

HERTFORD.

Mr. F. Haggar.

19 Dec. 1866.

4943. Is it linseed principally that you crush?—Linseed, rape, and cotton.

4944. The crushing of cotton seed has only taken place, I believe, of late years?—Within the last two or three years to any extent.

4945. Do you decorticate the cotton seed?—No.

4946. You crush the whole of the seed?—Yes.

4947. In the case of the linseed, do you steam that in the first instance?—Yes, after it has been ground.

4948. You steam it and put it into presses?—Yes.

4949. What runs out besides the oil from the presses?—Nothing.

4950. What remains in the presses is the linseed cake?—Yes; there is no refuse.

4951. Is there any from the cotton seed?—None whatever.

4952. Or from the rape seed?—None whatever.

4953. If you discharge anything into the river it is only the condensed water of the engine?—Yes.

4954. How many men do you employ?—From 60 to 80.

4955. Have you any privy accommodation on your premises for your hands?—Yes.

4956. Do they drain into sewers?—No.

4957. Does the refuse pass into the river?—Yes.

4958. Except that, no other refuse is produced on your premises?—None whatever.

4959. Would it be difficult for you to get the sewage from the privies conveyed into the sewers, so as to prevent that direct pollution of the river?—They do not come within a quarter of a mile of our place.

4960. Have you heard of what is called the earth-closet?—I have heard a description of it, but I have not seen it.

4961. Do you know upon what principle it is made?—I believe it is by using sifted earth for the refuse to fall on and to be covered over by it. I think the difficulty would be to get the quantity of sifted earth that was required.

4962. (*Chairman.*) Do you use any engine power?—Yes.

4963. What do you do with the ashes?—We burn everything up to the clinkers.

4964. You have no refuse ashes?—No.

4965. (*Professor Way.*) If you are not near to a sewer the probability is that you are near some land, and would it be impossible for you to sift the earth that might be necessary for the earth-closets requisite for 30 or 60 persons?—Not impossible, but it would be expensive.

4966. (*Chairman.*) Could not you so arrange the privies that an iron cart should receive the refuse, and then let the farmers take it away as the manufacturers do in the valley of the Aire and Calder, perhaps from 700 or 800 people?—Such an arrangement is quite possible.

4967. Would not the farmers pay for it?—I really do not know, but I am afraid they would not pay anything for it.

4968. If you were put under compulsion, and you were forbidden any longer to pass refuse into the river, would you not be obliged to do something with it?—Yes, we should be under the obligation then of asking the farmers to come and fetch it away, and therefore they would not pay anything for it.

4969. If the manufacturers in the north can get their refuse taken away into the country with profit to themselves, would there be anything unjust in saying that you should do the same thing?—Perhaps land is more valuable there, and manure perhaps is of more value than in an agricultural district like this.

The witness withdrew.

Mr. T. W. Grindle.

Mr. Thomas W. Grindle (Hertford) examined.

4970. (*Chairman.*) Do you manage the outlet works here?—Yes.

4971. How long have you managed them?—For nearly nine years, since they commenced.

4972. What weight of solid material do you get out in a week?—Not more than about 4 tons, perhaps 4 tons 10 cwt.

4973. Do you sell it?—Yes, we get 2*s.* 6*d.* a ton for a farmer's ton, about 25 cwt.

4974. Do the same farmers take it more than once?—Yes.

4975. They find that it is worth the price they give for it?—Yes; one of them has spoken for a lot after having taken it for four or five years before.

4976. Do you take it out and let it get dry?—We merely cast it out and let it drain.

4977. Does it smell in hot weather?—It does if there is any rain when the warm weather comes.

4978. Do you use lime to cause it to deposit?—Yes; lime to deposit and chloride of lime to disinfect.

4979. What weight of lime do you use in a week?—About 7 cwt. a day.

4980. How do you mix it, by hand?—It is mixed by a small waterwheel, there is a fall of about 3 feet.

4981. How much chloride of lime do you use?—About 64 lbs. such a day as this; I vary it according to what state I should fancy the sewage is in when coming down. If we have not had wet weather for a long time, I should use more, because I should know that the sewage would be in a worse state than if the sewers had been freshly cleansed out.

4982. How long have you used chloride of lime?—I should say for 3½ years.

4983. Did you begin before the cholera made its appearance?—Yes; long before that.

4984. Did you begin when complaints were made as to the foul state of the outlet?—Yes, as the people of Ware complained.

4985. You used the chloride to disinfect the sewage to a larger extent?—Yes, I found that it destroyed that nasty spongy weed that you find in a ditch, to a certain extent.

4986. What is the value of the material that you use each week for disinfecting purposes?—I should say it was nearly 1*l.* a day.

4987. What amount do you pay for wages?—About 17*l.* 10*s.* a fortnight, or 8*l.* 15*s.* a week.

4988. Do you pay 450*l.* a year for wages?—Yes.

4989. And 365*l.* for material?—I would put it at 350*l.*, it is a very little less than 1*l.* a day.

4990. Then it is about 800*l.* a year that the works cost altogether?—It is over 700*l.* a year I know.

4991. Who finds that money?—The New River Company.

4992. On the other side, what amount of income is obtained?—25*l.*, but it is not a question of taking the manure from it.

4993. It is a question of purifying, or rather of clarifying the water?—Yes.

4994. Have you had that water analysed?—Yes, several times.

4995. After it comes from the works?—Both as it enters the works and on leaving them.

4996. Have you any copy of that analysis?—It may be obtained from the engineer, Mr. Muir.

4997. Do you remember what the purport of the analysis is?—I have never seen it.

4998. Have you seen a scum rising to the surface of the river after the water from your outlet has passed in from the deodorizing works?—Yes.

4999. Does that take place more in hot weather than in cold weather?—It takes place more in hot weather, but on the purest river a scum will rise, but not that peculiar scum.

5000. Do you know anything of the sewers in the town?—I have seen connexions made with them.

5001. Have any complaints been made about the want of ventilation in them?—I have been frequently spoken to about it.

5002. Is there not a foul smell from the sewers?—There is more from the gullies than from the ventilators.

5003. It is from the gullies?—When I say the gullies, it is the grating that receives the washwater in the gutters, they are trapped.

5004. Would not that lead you to infer that the sewers require to be fully ventilated?—It is not so much from the sewers as from the cesspools or gullies.

5005. The gullies hold the sediment until it is cleared away?—No; at the time when these complaints were made it was a very dry season, there was very little or no water running along the streets, and there was a cesspool with a lot of stagnant water in it, and water will absorb any gas.

5006. The fact is, that a gully is a large cesspit to receive any sediment or deposit before it is passed into the sewer?—Yes.

5007. And the water becomes putrid?—Yes, unless it is changed; all gullies are upon the same principle, even in London. These are 16 or 18 inches, just large enough to put a scoop in. It was merely on account of the dry weather that the first complaint was made, and they did not keep a continual supply of water in those gullies.

5008. It was not gas coming back from the drain—No, there is too much water in those drains for there to be any great smell.

5009. (*Mr. Harrison.*) How are the sewers ventilated?—With an iron ventilator in the middle of the road.

5010. (*Chairman.*) Have you seen the method by which ventilators can be constructed so as to compel the gases to pass through a certain quantity of charcoal?—Yes; we have not tried that. We do not consider that we are bound to take away the smell.

5011. (*Professor Way.*) May I ask whether this is a case of divided authority?

(*The Mayor.*) The matter has been under the consideration of the corporation. The opinion of counsel has been obtained, and we are now in communication with the New River Company upon the subject.

5011*a*. (*To the witness.*) Who has charge of the drains?—The New River Company.

5012. Then the corporation have not charge of their own drains?—No.

(*The Surveyor.*) I may mention that the old drains, before the introduction of sewers by the New River Company, were made in each separate parish by the surveyor. There was no regular system about it. The fall was very little in the upper part of the town, and of course the old system was very bad. The New River Company were not bound to interfere with those old drains, but to intercept them, cut off their connexion with the river, and turn them into their sewers. In consequence of this there has never been any perfect system of drainage or sewerage, and the corporation has nothing to do with them beyond seeing that they are kept clean.

5013. You do not owe any allegiance to the corporation?—Not the slightest.

5014. You have the control of the drains?—The control of the sewers, not the drains.

5015. (*Chairman.*) When was the defect in the ventilation of the sewers first complained of?—It was first spoken about to me the year before last.

5016. That was a very hot year?—Yes, and a dry year. I may say that it was only a year before that that I had charge of the sewers.

5017. (*To the witness.*) Your sewers are ventilated in the same manner as the great majority of the metropolitan sewers by a shaft through which the gases escape in the centre of the street?—Yes.

(*Mr. Beardmore.*) Might I be allowed to explain that, when the New River Company laid down their new sewer through Hertford all the old drains had a fall to the river, and they bricked up the mouths of the sewers going to the river and made a thorough good stoppage of it, but the sewers still lie with the fall reversed; then the old gullies were also left, so that there are many things in the town which have not been altered, that the New River Company did not alter.

(*The Surveyor.*) I do not think there were any of the old drains left; they were intercepted and reversed some of them.

The witness withdrew.

Mr. William Pollard (Hertford) examined.

Mr. W. Pollard.

5018. (*Chairman.*) You wish to put in some papers, I believe?—Yes. This (*handing in the same*) is the original memorial from the corporation when they applied for 3,000*l*. to make new waterworks, and this is the counter memorial (*handing in the same*) which was agreed to and signed by a majority of the ratepayers of Hertford, and there is also the second rejoinder that we issued to the reply of the corporation.

5019. Are there any other documents that you wish to put in?—I have observed that you mentioned Mr. Ranger's visit to Hertford, and I have brought you a copy of the "Herts Guardian" (*handing in the same*), containing a report of Mr. Ranger's inquiry relative to the permission of the Lords of the Treasury to raise this money for the work to be done here. Mr. Armstrong was then acting on behalf of the ratepayers of Hertford in opposition to the corporation, but he was unable to attend at the meeting which took place when Mr. Ranger came down, and the bulk of the thing fell upon myself. That will account for Mr. Armstrong's name not being mentioned in that report, but he was acting officially for us. I have also a paper containing Dr. Taylor's report, but I have brought you a copy of it in print (*handing in the same*).

5020. Are these all you wish to put in?—Yes, the evidence is closed, and therefore I do not think I ought to take up your time, but I may perhaps say that the analysis made by Dr. Taylor resulted from some remarks that I made. You will remember that in August last the Privy Council recommended that all water should be boiled and filtered before it was used. The surveyor general to the Post Office sent a similar recommendation, and there was one also published in the Lancet. I had stated that I did not consider it advisable that the water which the public received from the new waterworks should be used without being boiled and filtered, and I believe it was in consequence of those remarks that an application was made to Dr. Taylor, and he made his analysis of the water; but it has always seemed to me that there was something very inexplicable in that report. Dr. Taylor gives a very favourable analysis. I do not say this with any idea of casting any imputation upon Dr. Taylor, but you know that the opinion of counsel sometimes varies according to the instructions that are given, and the questions that are asked. Dr. Taylor stated in his analysis that the water was pure, and I took the liberty to ask him by letter what he meant by those terms, whether he meant that the Hertford water was exceptional water, to which the recommendation sent all over the country that it should be boiled and filtered did not apply, or whether he meant that it should be filtered for making tea, or drinking cold. We have here many excellent springs of very pure water. I believe that no town is better supplied than Hertford is, and to those who drink water at their meals, it is of great consequence that we should have the best water we can get. To those who drink beer it is another consideration, because that water has been boiled. I asked Dr. Taylor with regard to what he meant by "Fit for drinking," and he said, "The words fit for drinking, "mean simply that the water is fit and proper to drink "cold. With respect to filtering, I think it proper,

HERTFORD.

Mr. W. Pollard.

19 Dec. 1866.

"under present circumstances, that all water for "drinking should be filtered if drunk cold." He furnished me with plans of the filters that he used in his own house, and after we have paid him 48*l.* 5*s.* for saying that this water is fit for drinking, he says that it is right and proper it should be filtered before it is drunk. I think I ought to add that we have some rather extraordinary evidence connected with the question of this water; it seems to me that the water from the river Lee is at times in a much purer state than at others. I fancy that the water that was furnished to Dr. Taylor for analysis was taken at a time when the river was in a purer state, and it is certain, from evidence which has been given voluntarily to me by tradesmen in the town [two of them being bakers], that the water at times is in an extremely offensive and disagreeable state. I inspected it at the request of a gentleman at the police office; it came, I believe, from the new works, and it was full of *animalculæ*. The inspector thought that the glass was not clean, and we took it a second time, and it was then full of animalculæ. Two days later I called at the house of Mr. Twaddle, who, a few days previously, had sent some water to the police office; some of it was drawn for me in a glass, it smelt disagreeably, and it had certainly anything but a pleasant taste.

5021. When do you consider the river Lee is in its purest condition; when it has the clearest water in it, or the muddiest?—I can hardly say, but I think when it is muddiest it is in the purer condition. I think I ought to say one word as to the commercial interests of the neighbourhood. I am always in direct communication with the principal merchants and millers of this locality, and I can assure you that they would regard with great jealousy any attempt to remove any further quantity of water from the river Lee for the purposes of the large London consuming companies. I believe their opinion is that your suggested reservoirs would be a very excellent scheme, if it could be carried out, in order to secure the flood water and bring it into the river at proper times, and not to admit any sewage water into the Lee at all if you can get rid of it by any other means. I have seen a good deal of Dr. Gilbert, the right hand man of Mr. Lawes, the manure manufacturer, and at his house I have met Mr. Campbell, who has been conducting sewage operations. Mr. Lawes and Mr. Campbell have both been conducting experiments at Rugby as to the town sewage, and I know that the opinion which Dr. Gilbert, who is Mr. Lawes' right hand man, and Mr. Campbell, have expressed is this, that you do not get rid of the poisonous matter of the sewage by the deodorizing process; that the refuse matter which is carted away by the farmers is comparatively innoxious compared with the water; and that the water which goes down from these works contains the quintessence of the poisonous matter. They seem to consider that you should prevent any water of that kind from going into the rivers from which water was afterwards to be supplied for drinking purposes. Personally I have had but little to do with Mr. Lawes, it has been principally with Dr. Gilbert, but I know their opinion is, that the water that comes from the deodorizing works is so poisonous that it ought not to be mixed with water from which towns afterwards draw their supply.

The witness withdrew.

Adjourned to Wednesday, 16th January 1867, at Ware.

Ware, Wednesday, 16th January 1867.

PRESENT:

ROBERT RAWLINSON, ESQ., C.B., IN THE CHAIR.

JOHN THORNHILL HARRISON, Esq. | Professor JOHN THOMAS WAY.

WARE.

Mr. N. Cobham.

16 Jan. 1867.

Mr. NATHANIEL COBHAM (Ware) examined.

5022. (*Chairman.*) You are a solicitor?—I am.

5023. Are you clerk to the local board of health for the district of Ware?—Yes, and I have been since its formation in 1849.

5024. What is the population of Ware?—Nearly 6,000.

5025. Do you know what it was in 1849 when you adopted the Public Health Act?—Not exactly, but there has not been a very great increase.

5026. Is there any official report that was made in 1849?—No.

5027. How were you able to put the Act in force—was it done without a report being made?—We went through the necessary forms to enable us to put it in force, and we adopted it in 1849.

5028. Was any inspector sent down?—Yes, Mr. Ranger came down, and he reported upon the state of the town, and as to the desirability of having a board of health here.

5029. Have you a copy of that report?—No.

5030. How long have you known the town of Ware?—For 45 years.

5031. Is the town situate on the river Lee?—Yes.

5032. Is the river navigable up to Ware?—Yes, and to Hertford, which is two miles further.

5033. What is the principal business carried on in Ware?—Malting, and there are large brickfields besides, but malting is the principal trade.

5034. Is there much manure brought either up the navigation or taken down?—There is a great deal of manure brought up from London.

5035. Is that discharged on to the towing-path or banks of the canal and river?—Yes.

5036. Is there any system of sewerage in the town?—Yes, the town is under-drained from the commencement of it to the end of it.

5037. Who laid out the sewerage?—There was some sewerage before the board of health was established, and some has also been made since under the direction of the surveyor.

5038. Where do the sewers empty themselves?—We have five sewers that empty themselves into the river Lee.

5039. Are there any disinfecting or depositing tanks of any kind at the outlets?—No, none are required as far as smell is concerned.

5040. Does the sewage go directly into the waters of the Lee?—I wish to say that the sewer that Mr. John Marchant spoke of at Hertford as the main sewer is not at all the main sewer of the town—he was mistaken in what he said—there is a sewer of about 4 feet in diameter, that was made some 45 years ago for the purpose of taking down the flood waters from the town, since that time all the under-drains in that part of the town have been drained into this sewer, but the sewer itself was made entirely to carry off the flood waters. I should tell you that in the upper part of the town originally, and as long as I can remember, there was a sort of open ditch which was washed down by the water from the Lee twice a week, of course all the filth and manure of the town were washed down the street and went down just where this large sewer is that Mr. Marchant spoke of; it went down there where the sewer is now; it used to go down the surface of the street, all the flood water that came down discharged itself into an open sewer

2 or 3 feet deep. In order to get rid of that the trustees of the Cheshunt trust made this large sewer to bring down the flood water, they took it through private property; they did not adopt the plan that they had. Under a blacksmith's shop nearly opposite to where it goes down, by Mr. Gosling's, that is a covered sewer.

5041. You take down now in a covered sewer what formerly went down in a surface channel?—Yes.

5042. Are there many waterclosets constructed in Ware?—The surveyor will give you the exact number. I think there are altogether 260.

5043. Do you know what number of butchers there are in the town?—Seven or eight.

5044. Have they private slaughter-houses attached to their premises?—No, they are not attached to their premises.

5045. Whatever killing takes place is done in private slaughter-houses?—Yes.

5046. Where does the drainage from those slaughter-houses go?—They are not drained into the river at all, the refuse is taken away in carts.

5047. Are they drained into cesspools?—Yes; one is drained into the river.

5048. Is the blood always carried away?—Yes. I have said that one is drained into the river, but the blood is not drained in, the washings of course go.

5049. If there is any drainage from any of the slaughter-houses it will go the way of the other drainage?—Yes, for that one which I have mentioned, the others drain into cesspools, but they do not allow them to overflow.

5050. Is there an inspector of nuisances for the town?—Yes, he will be here to be examined.

5051. Are there any markets or fairs held in the town?—There is a market every Tuesday, and two fairs which are held in April and September.

5052. What is sold in the market that you have every week?—It is for the sale of corn and cattle.

5053. Where do the washings from the streets and the dirt caused by the cattle go?—We have not a sufficient number of cattle here to have any washings.

5054. The cattle brought to market are not numerous?—No.

5055. What is the chief trade of the district?—Malting; it is the largest malting business in the kingdom, we have returned upwards of 200,000 qrs. of malt.

5056. What value in money do that quantity represent?—I have a return here from the collector in the district, and the figures are 256,224 qrs.

5057. What would the average price be?—78*s*.

5058. Is barley grown in the district?—There is very little barley grown in proportion here, it is brought from all the surrounding counties, Norfolk, Essex, and Cambridge.

5059. Is it brought to Ware by railway partly and by the river?—The barley is chiefly brought by the railway.

5060. Does it go away as malt by the river or by the railway?—Chiefly by river—by far the greater proportion after it is made into malt—they could not take it all away by the railway.

5061. Will any practical maltsters be here to give evidence?—Yes; the information that I have obtained was from the collector.

5062. Is there any public water supply in Ware? No.

5063. How do the inhabitants obtain their water?—They get it from pumps on their own premises.

5064. What is the subsoil?—Gravel overlying chalk in all this part of the town, lower down beyond the bridge the subsoil is boggy.

5065. Do they obtain an abundant supply of water by sinking wells?—Yes.

5066. If there are only 250 waterclosets in use, I assume that by the rest of the population cesspools are used?—Yes.

5067. Are they sunk into the same gravel that you get the water from?—Yes.

5068. You have a system of wells for water supply, and cesspools or cesspits for storing the refuse?—Yes.

5069. Are those cesspits or cesspools emptied by the individuals who own them, or is that operation considered to be a part of the duty of the board?—They are emptied at the expense of the individuals.

5070. When they choose, I suppose, to give you notice?—No, it is the duty of the inspector to take care that proper notice is given to the parties when the cesspools get full.

5071. Are they served with a notice?—Yes, if they require it, and they are liable to a penalty if the cesspools are found to be full without any notice under the byelaws of the board.

5072. Are any regulations laid down as to the time when they are to be emptied, or are they emptied indiscriminately, or at any time?—No, the parties are bound to have them emptied between 12 o'clock and 4 in the morning in properly covered carts, and the sewage has to be conveyed out of the district.

5073. Has there been any complaint of a nuisance being caused during the time when those places were being emptied at night?—It is the business of the inspector to take care that there should be no cause for complaint, and that they should use ime.

5074. Have you a cesspool at your house?—No, a watercloset.

5075. Have you ever passed by at night when the cesspools were being emptied?—Yes, I have smelt them offensively, on coming home at night from a party.

5076. You would say I suppose that generally where the matter has become putrid it is offensive, and its offensiveness would be in proportion to the kind of weather when the emptying takes place?—No doubt of it.

5077. In hot or damp weather it would be more offensive than in dry weather?—Yes.

5078. As a local board have you any public debt?—Yes.

5079. For what purpose was it incurred?—We incurred a debt for paving purposes.

5080. To what extent?—1,500*l*.

5081. Have you repaid any part of that debt?—Yes, we are paying it off at the rate of 150*l*. a year and the interest; we borrowed 1,500*l*.

5082. Have you ever discussed at the board the desirability or otherwise of having a public water supply?—We have discussed that question several times.

5083. Where do the maltsters get their water?—From wells of their own.

5084. Is it pumped up by engine power?—No, it is pumped up by hand except in one instance.

5085. Is there little or no engine power used in Ware?—None; except that the New River Company have an engine.

5086. What do coals cost you for domestic purposes in Ware?—About 26*s*. a ton, sometimes less, never so low as 20*s*., I mean delivered at 26*s*.

5087. Is any part of the town or the neighbouring district liable to be flooded in times of excessive floods from rain?—We have had immense floods, but the town of late years has not been flooded.

5088. What part of the district is generally flooded?—The meadows are flooded constantly, but the town itself is not. Years ago, and until means were applied for the better getting off the water by the trustees of the Lee, I have known Amwell End to be so flooded as to be impassable.

5089. Have you heard complaints made with regard to that flooding, as to its causing disease, or fever, or making the place unhealthy?—None; I believe that Ware is an extremely healthy place, owing to the subsoil being gravel.

5090. To whom does the land which is flooded belong?—To different owners.

5091. Not to any large landed proprietors?—No.

5092. Have you any large landed proprietors in the neighbourhood?—No, not adjoining the river.

5093. There are no large landowners owning pro-

WARE.

Mr. N. Cobham.

16 Jan. 1867.

perty in the town?—No, there are some large proprietors of land lying outside the town, but not adjoining the river.

5094. There is nothing that impedes the growth of the town?—No.

5095. By whom is the house property owned—by separate private owners?—There are a great many owners; we have no noblemen who have any control over the property, it is a great deal dispersed; the maltsters hold property of their own.

5096. Is the land generally held on leasehold or freehold tenure?—Freehold.

5097. What does land sell at in the town per square yard?—The price varies very much. When we laid out a new street, the land fetched from 50*s.* to 3*l.* for building purposes. Land is dear in the neighbourhood, from 80*l.* to 90*l.* an acre.

5098. May we take it that Ware is at the present time a thriving place?—Yes, I think so. There was more malt made in Ware last year than had ever been known to be made before. The town was very much depressed a few years ago in consequence of the failure of a bank, but since that it has recovered itself.

5099. Do you remember what number of applications have been made to the local board of health, or were made last year, for new buildings?—No.

5100. I suppose that all persons are required before hand to deposit plans and to give you notice of their intention to build houses?—Yes, they are required to deposit plans and to show what drainage is intended, and I may state that there was an instance the other day in which a London builder did not furnish any plans, and he was summoned before the magistrates and fined, but only nominally—there was no desire to press upon him because it had been evidently done without knowing what the laws of the town were.

5101. You have had considerable experience of the working of the Public Health Act, and the Local Government Act?—Yes.

5102. Have you found them of any advantage to the town?—I consider that they have been a very great advantage, the town is in a very different state now, indeed I think it would hardly be known by persons who knew what it was 20 years ago.

5103. Has there been any unpleasant interference with your affairs by the central board?—No, they have never interfered with us in any way.

5104. Have you ever had occasion to ask advice of the central board as to what it would be best to do under certain circumstances?—Never; the board here have always conducted their own affairs, quite independently.

5105. You would say then generally that in your transactions with the central board in London you have never been obstructed or improperly interfered with?—Never.

5106. Upon the whole you believe that you are better off on account of having adopted the Local Government Act?—Yes, I am quite sure that we are very much better off.

5107. What number of members do you elect on the board?—We elect three members annually; the whole board consists of nine.

5108. You have a clerk, surveyor, and inspector of nuisances?—Yes, and an officer of health.

5109. Is it unfair to ask you what the salary of the clerk is?—No, I receive 100*l.* a year, which includes all the law expenses, whatever they may be, except cash out of pocket.

5110. For that remuneration you attend the board and keep their minutes either by yourself or by one of your clerks?—Yes, I conduct all the correspondence.

5111. You transact the whole of the law business?—Yes, free of expense, except money out of pocket.

5012. What does the surveyor receive?—30*l.* a year.

5113. What do you pay the inspector of nuisances?—25*s.* a week, and he collects the rates for the board.

5114. He is both rate collector and inspector of nuisances?—Yes, for the board.

5115. What does the medical officer receive?—10*l.* a year.

5116. How often does the officer of health report to the board?—Every board day; once a fortnight.

5117. Are those reports verbal or made in writing?—In writing.

5118. If it was required, could you give us an abstract of them?—They are here to-day.

5119. Have you any suggestions to offer relative to the special purpose of our inquiry?—I may say that I do not see that it would be possible to divert the drainage of this town in any way, as the water from the maltings alone passing through our sewers in the malting season amounts to 37,000,000 of gallons, that is during six or seven months, and it all passes back into the river.

5120. What do you infer from that fact?—That I hardly know how it would be possible to take our flood water and 37,000,000 of gallons from the maltings into any place for drainage.

5121. Have you any idea what sized sewer would be required to pass off 37,000,000 of gallons in the months you have mentioned?—It is not the passing it off only, it is the stowing of it away.

5122. You are supposing that it should be dealt with and not allowed to pass into the river?—Yes.

5123. Do you know whether there is anything in that water that would make it desirable for irrigating purposes; what does it contain?—I do not know, that is rather a chemical question, but the water when it comes from the cistern is not disagreeable in itself. If it is allowed to become stagnant it vegetates, and then becomes very offensive.

6124. Is there any other difficulty that you can point out that presents itself with regard to your sewerage?—Yes, the fall through the maltings is all to the river, and I cannot conceive how you could get it away unless you made drains for the purpose.

5125. Do you see any difficulty in dealing with the sewage proper?—I see the same difficulty, because all the malting water is drained into the sewer and mixed with the sewage and the flood water.

5126. If the Legislature were to forbid you to pass foul water of any kind into the river, do you suppose that that would impose upon you a serious difficulty?—Yes, I do. I conceive that it would be one of the most unjust things that ever happened to any town. I look upon the navigation to be one of the great highways of the country, and into it this town has always drained.

5127. Are you aware what number of people are supplied from the Lee with drinking water in London?—Not at all.

5128. Will you be surprised if I tell you that something like one million of persons are dependent upon the river Lee for their supply of water for domestic purposes?—No, I should not be surprised at it at all.

5129. If health is the first requisite in the world, and if, to preserve it, it is necessary to supply the people with wholesome and pure water, is there anything you can put in the opposite scale when 1,000,000 of persons are concerned?—With regard to the schemes which have been suggested for the purpose of taking pure water to London, I do not think, as far as the river is concerned, that you can have a supply of pure water in London from any open river like the Lee.

5130. You probably think that it would be better to bring in, as has been proposed, pure water from the lakes of Cumberland, or elsewhere, and leave the Lee to be used for the purposes of navigation?—Yes, decidedly; because if you shut up the river Lee, and this town is not to have the use of it for navigation, you might as well shut up the town altogether; you would seriously injure or do away with the malting trade altogether.

5131. You are of opinion that for the interests, not only of this town, but of the district, you must preserve the river Lee as a navigation?—No doubt of it.

5132. According to your views you are to make use of the river Lee as the medium of draining the country?—No, I do not go quite so far as to say that you

WARE.

Mr. N. Cobham.

16 Jan. 1867.

are to allow all kinds of drainage from manufactories, or to let all kinds of poisonous matter pass into the stream; but as to any drainage that passes as it does from this town into the Lee, that is, malting drainage, and the drainage of the town going in as it does at so many different places, I say that there is no smell from it at any part of the town. As I stated before, the main drain, that was so spoken of by Mr. Marchant, is not the main drain, and as the drainage passes off there is no smell from it whatever.

5133. Looking at the question in a common sense point of view, if you had only the soluble portions of the sewage from one watercloset, whether it smelt or not, to deal with, do you think you could divest your imagination of the thought that it was poisonous if it was to be drunk?—I do not believe that when once the poison is in you can get it out.

5134. If poisonous matter passes into the river Lee and the water is afterwards to be drunk, do you think that ought to be so?—I say that I think it ought not to be so.

5135. That is to say, you would prevent people from drinking the water of the Lee?—Yes.

5136. You would not attempt to purify it?—I would not have the river Lee made a cesspool of, but I think that all matters that did not cause a nuisance ought to go in. I may mention that the New River Company, when they applied to Parliament for a bill some years ago, had a clause inserted in the bill to prevent the sewage of Ware going into the Lee. The board of health instructed me to oppose that clause, and I think I attended the committee of the House of Commons for 23 days for that purpose. The committee struck out that clause, and introduced a clause preserving the right of the board of health to drain into the Lee; that was in 1851.

5137. Have you seen the new Act which has been obtained by the Conservators of the river Thames?—I have not read it.

5138. I should recommend you to look at it carefully and see what Parliament has done in that case?—I will do so. The great thing that we have to contend against is the sewage from Hertford, which creates the greatest possible nuisance in this place; their sewage is brought down all together, while ours passes in at a variety of places. The board were advised with reference to the Hertford sewage to take the opinion of counsel, and the opinion of counsel was that the New River Company ought to be indicted.

5139. (*Mr. Harrison.*) They take steps at Hertford to disinfect their sewage do they not?—Yes.

5140. Notwithstanding that, you say that a nuisance is caused to the inhabitants of Ware by the sewage of Hertford?—Yes, and so much so that people cannot sit in their own summer-houses or be on the water at certain times. I have communicated with the trustees of the navigation upon this subject several times.

5141. Is there a deposit caused in the river?—The sewage creates a sort of fungus on the top of the water. The drainage of Hertford comes into a piece of still water, and when the barges pass through a lock the water that comes down is most offensive.

5142. How far below Hertford is the first lock?—At a distance of about a quarter of a mile.

5143. What fall is there to that lock?—About 8 feet.

5144. How far is it from that lock to the next?—Two miles along the watercourse.

5145. How much fall is there between the two?—I am told that there is a fall of 11 feet in the two miles. The Hertford sewage comes down what is called the Manifold ditch into a still piece of water; it passes only through one lock before it comes here.

5146. Is there any land on the side of the Lee that you think might be obtained on to which the sewage might be passed for irrigating purposes?—The New River Company had a clause introduced into their bill by which they proposed then to take the Hertford sewage right away below Ware along the river Lee, but the New River Company were not to carry that part of the bill out unless they liked, but they bought land of a gentleman who is present, for the purpose of taking the sewage of Hertford below the town of Ware.

5147. Is there any land below Ware upon which the sewage of Hertford might be applied in the way of irrigation?—Yes, no doubt there is.

5148. Do you think you could obtain that land without any difficulty?—I do not think any land could be obtained anywhere near here without difficulty.

5149. Are you aware that sewage when applied to land in that way is found to be most fertilizing and profitable?—I think it is so, but not so much after it has been deodorized; when it is taken directly on to the land I have no doubt it is as you say, but if it is first deodorized my opinion is that the virtue is taken out of it.

5150. In this case you appear to have a fall of 11 feet within a distance of two miles of the town, that is abundant fall to enable you to apply the sewage of Ware to the land?—The fall of 11 feet is above Ware, and I believe there is about the same fall between Ware and Stansfield.

5151. There is abundance of fall from Ware downwards, is there not, to enable you to apply the sewage of the town to the land without any pumping?—No doubt of it.

5152. You say that you know it is profitable, and if the sewage could be applied to land without any pumping there would seem to be no hardship in calling upon the inhabitants of Ware to apply it to the land?—I do not know where you are to go; as to the sewage from the maltings, according to the fall that there is now, you could not get that back into the town.

5153. (*Professor Way.*) I think you stated that it would not do to shut up the navigation?—The question has been asked, I think.

5154. Do you think it would be impossible, while the navigation was preserved, to improve the condition of the water?—No doubt the purity of the water would be improved if you were to shut out the drainage.

5155. Do you know of any reason why that should not be done in Ware as in other towns?—It would be attended with enormous expense to the town unless it were done at the expense of Government or at the expense of the large water companies.

5156. What should you consider an enormous expense?—I hardly know, but I hear that it would be an enormous expense to the town.

5157. You have stated that 37,000,000 of gallons of water were discharged from the maltings in six or seven months, which is something like 200,000 gallons a day?—I mentioned that quantity as being something like what you would have to deal with if you had to stow it away in any place; I mean a place to receive the sewage of the town.

5158. (*Chairman.*) I wish you to dismiss from your mind the idea of stowing away; this Commission will never recommend the stowing away of that which would grow more corrupt every day?—I am glad to hear you say so.

5159. (*Professor Way.*) There is that certain quantity to be dealt with every day, 200,000 gallons, which are only one-fifth of a million, and 1,000,000 gallons of water are dealt with every day at Croydon at this moment without any trouble?—Then you must take the large sewer that comes down the town, which is a 4-feet sewer, and that is full of water in flood times, full to the brim.

5160. (*Chairman.*) Does that sewer also convey the town sewage?—Yes, that is the one Mr. Marchant spoke about as being the main sewer of the town; it takes away the flood water and a portion of the sewage of the town only.

5161. (*Mr. Harrison.*) Does the water from the maltings pass into a part of the river that is stagnant?—It passes into a variety of places.

5162. Is the navigation stagnant?—No part of it.

5163. Is it always on the move?—Yes; Ware mill

WARE.

Mr. N. Cobham.

16 Jan. 1867.

is situated above the town, and the water in that part of the river is always passing downwards.

5164. (*Professor Way.*) There is no reason, is there, why the same thing should not be done here that is found to be advantageous when done in other towns?—No, all things being equal.

5165. Mr. Harrison has elicited from you that there is a fall by which the sewage of the town might be passed away?—No doubt there is.

5166. You have also stated that there is a larger malting trade carried on in this town than in any other town in the kingdom?—Yes.

5167. I suppose you know that in the act of converting barley into malt a certain quantity of the substance of the barley is taken away in the water in which it is steeped?—Yes.

5168. Do you think that that is likely to be injurious to land?—No.

5169. Does not it follow that the sewage of this town, plus the water from the maltings, would be better than ordinary sewage?—Yes.

5170. Does not that lead to this, that there could be no serious difficulty in dealing with the sewage of this town and possibly a great advantage?—I think there is a serious difficulty in getting rid of the drainage from the maltings and from the town.

5171. (*Chairman.*) Are you of opinion that the water from the maltings would be a benefit to the land rather than an injury if applied economically?—Yes, I think it would be.

5172. Would it not take back to the land that which would be beneficial to it?—Yes.

5173. Are there any water meadows in this neighbourhood where irrigation is practised?—None that I know of.

5174. Did you ever see waters meadows so treated?—No.

5175. You know, I presume, that there are places where irrigation is carried on by spring water?—I do not know that.

5176. I suppose you would think, that if something was put into that water to add value to it as manure, it would be more advantageous to use it?—No doubt of it.

5177. If town sewage is passed into a certain volume of water, and the refuse from the steeping of malt, which contains solid ingredients that would be beneficial to land, is also passed in, I suppose you would consider it so much better than spring water?—No doubt of it.

5178. And the only other question to be considered would be the cost of the apparatus, the labour required for putting it on the land, and management?—Yes, no doubt of it.

5179. You have never witnessed the irrigation which is carried on at Croydon, Worthing, and Norwood?—I have not.

5180. Have you never read anything about it?—Very little.

5181. Do you know what weight of hay is usually taken off a rich meadow?—I took five loads off $2\frac{1}{2}$ acres the year before last.

5182. What might that represent in weight?—It was above 36 cwt. per acre; but it was an exceedingly good crop that year, for there was hardly any grown.

5183. Are you aware that your meadow might be made to yield 10 times that weight?—I should be very glad if it could; I think it might be made to produce a great deal more by passing sewage matter on to it.

5184. (*Professor Way.*) You have no reason to believe that your town is worse situated than any other town you know of for the disposing of the sewage as has been suggested on the land?—No, if there is sufficient fall, certainly not.

The witness withdrew.

H. Butcher, Esq.

HENRY BUTCHER, Esq., (Licentiate of the Royal College of Physicians, Edinburgh,) examined.

5185. (*Chairman.*) You are medical officer of Ware?—I am.

5186. How long have you known the town of Ware?—Nearly 30 years.

5187. How long have you practised as a surgeon?—Altogether since 1828.

5188. We may assume, I suppose, that you have had very considerable experience in this district?—Yes.

5189. Are there any special types of disease connected with the district that you can name to us?—No, I think not.

5190. Do the inhabitants never suffer from ague?—Never.

5191. Or from any low type of fever of any kind?—Very seldom; not as a rule.

5192. Do the people suffer from gastric fever at all?—Very seldom.

5193. Do you meet with typhoid fever?—Hardly ever.

5194. Or typhus fever?—Yes, at times.

5195. Have you ever had cholera here?—Yes, once since I have been here.

5196. In what parts of the town have you had to to treat cases of typhus, in what class of houses, and what class of people?—The worst cases of typhoid fever have occurred up at Musley in the new cottages that have been built there. I have had one serious case lately to treat, but that may be said to have been brought from London. The patient whom I was called in to attend had been to London to visit her father; I will with your permission read an extract from the entries contained in this book; this is a report of mine, "I beg to call the attention of the board "to the extremely dirty condition of some cottages in "Musley, particularly to one which I have already "named to the inspector of nuisances. I have met "with none so filthy for a long time, it consists of "three small sleeping rooms, and up to within a few "days they have been occupied by the lodger, his "wife and three children; the tenant of the house, "his wife and two children. The wife of the lodger "is dangerously ill with typhus fever, caught proba- "bly whilst on a visit to her father in London who "died from fever about five weeks ago; a sister died "from the same cause about three weeks before, and "the mother on Friday last. I called the attention of "the relieving officer to the case on Tuesday last; "he refused to interfere, and up to this evening has "made no personal inspection, and I shall not be at "all surprised if the fever becomes of serious conse- "quence to the immediate neighbourhood."

5197. After you had made that report to the local board, did they cause the house to be purified?—I believe it has not been done yet. This was on the 10th of December, and there has been fever ever since in that house.

5198. Do not you think that in that case the board would only do their duty by taking possession, legally or illegally of that house for a short time, for the purpose of cleansing and purifying it?—Yes, and I called the attention of the relieving officer to the matter on Tuesday last being also a guardian of the union, but as I said before he refused to interfere, and up to the evening of the day when I made the report had made no personal inspection. I should explain that the relieving officer refused to interfere because the husband was said to be earning 5*s.* a day; he did not even go to inspect the house, and when the case came before the guardians, before whom I brought it a day or two afterwards, they decided that he ought to have gone to inspect the case and have given relief. If the party had been in a condition to have paid afterwards it ought to have been done in the way of a loan.

5199. Might you not compare the existence of fever in one small spot to a large farm building which had caught fire and had just begun slowly to burn, and which a few buckets of water would at once extinguish, whereas if no attempt was made to arrest the progress of the fire the whole place might be burned down?—Yes.

5200. And so if that particular house had been dealt with in the case you have mentioned, the spread of typhoid fever might have been prevented throughout the district?—I believe that a great deal might have been done, and that was my object in bringing the matter before both boards as I did.

(*Mr. Cobham.*) May I be allowed to say with respect to that report of Mr. Butcher's, that the inspector of nuisances received orders to visit the house immediately, to use disinfectants, and to see that the parties did everything that was required to be done. Disinfecting fluid was entirely at his service. I should, perhaps, add that this happened at a time when the board had adjourned for a month in consequence of the Christmas holidays.

(*Witness.*) The disease has not yet disappeared from that house, and the occupier, a woman, is still suffering.

5201. (*Professor Way.*) How long has that woman been ill?—I think I was called in about the 7th or 8th of December.

5202. And fever exists there now?—Yes.

5203. (*Mr. Harrison.*) Were you called in as medical officer of the board of health?—No, I was called in as a private practitioner.

5204. Were the parties in distress and in want of relief?—Yes, so far that there was not proper nursing provided; the woman was occupying a room with three children, and although the man was said to be earning 5*s.* or 7*s.* a day when employed, he had been ill himself some time ago with diarrhœa; some months back after coming from London at the time the cholera was prevalent.

5205. Was he at the time receiving 5*s.* a day?—Yes, and that was the relieving officer's excuse for not going. (*The witness subsequently informed the Commissioners that the illness of the above-mentioned female patient had terminated fatally.*)

5206. (*Chairman.*) Have you at any time had occasion to suspect the purity of the water that the people were drinking in places where fever and disease of any kind has been prevailing?—Yes, I have; there were three or four cases which I noticed in my reports, and in one place the water used to be very pure in one of the wells, but there has been a privy erected near it and that has polluted the water, so that it cannot be used for domestic purposes.

5207. (*Mr. Cobham through the Chairman.*) Are you aware that that well was stopped up and a new well sunk after you made your report?—Yes; I believe it has been done since.

5208. (*Chairman.*) Have you found in your experience that the use of impure water produces disease in this town?—No, I think the case I have mentioned is quite an exceptional one. The water in the wells of Ware is very good indeed. My attention has been called to the river Lee occasionally, and I have reported upon it. On the 12th of December 1864, I reported in these terms, "Last week on crossing "Ware bridge I observed the river Lee covered "with a black oily scum, which on close examination "I found was in a state of fermentation, and giving "out bubbles innumerable of gas. A large quantity "of seething and putrid mud was deposited by the "edge of the river. Whence it came I could not "satisfactorily ascertain, for on proceeding with the "local inspector to the outlet of the Hertford drain-"age all was clear and limpid." I was told by the relieving officer that the stench was very great indeed. "Still the matter, which I have no doubt, on analysis, "would be found to be of a poisonous character, might "and did most probably float from thence, that part of "the river having had time to clear itself before we "visited it." I thought, as the water there comes, as it were, upon a dead level, that it had remained there until it got agitated by barges going backwards and forwards, and that that in a great measure caused the stench. Opposite to this place there are houses, and the gentlemen occupying them have summer-houses, which they used to occupy very much. One gentleman made use of his summer-house as a study, others used to take their meals in their summer-houses, particularly their tea, but all of them, I have understood, have been obliged to give up this practice on account of the stench. I have further been told that gudgeon cannot now be found, that they have quite disappeared from that part of the river. That is all I have to say as to the condition of the drainage.

5209. You are a guardian of the poor?—Yes.

5210. How long have you acted as guardian?—I should think 15 or 16 years.

5211. Can you put in a tabulated return of the rates of mortality compared with the population?—I have gone through the reports for the last two years made by the sub-registrar of the deaths, and I find that the deaths between January 1865 and January 1867 were 231, taking the population of Ware—the population of St. Mary's being 3,400 in 1858 and of Christchurch 1,200—but the register contains also those who have died in the neighbouring parish of Thundridge. I might point to the lamentable amount of deaths among the children under two years of age, no fewer than 63 out of 231; there were 15 deaths above the age of two and under 21, 52 above 21 and under 60, 101 above 60 and up to 100; the average age of these put together is 73 and 4 months, so that Ware does not appear to be a very unhealthy town.

5212. Are the children of the town employed in any kind of occupation?—Not any.

5213. (*Professor Way.*) Are any young children brought into the town to be nursed?—No; I find that the diseases are principally catarrh and of a bronchial and rheumatic character. There is some diarrhœa in the autumn, but not excessive, and fever is generally of an endemic character; it appears in Musley and also at a place in Amwell End, where there are a number of new houses, and I never could understand why it was not included within the jurisdiction of the board of health; it is a small place which is just left out.

5214. (*Chairman.*) Judging from your past experience, do you think that if people could be induced to be cleanly in their persons, to be temperate in their lives, and could protect themselves from cold and wet when out of doors, and their dwellings were properly ventilated, you would have very little fever?—I think we should have less fever than we have; still, I have never known any real epidemic here. Scarlet fever one year was very bad, and also cholera once, but it was not so bad as it was elsewhere.

5215. When were you troubled with cholera?—I think 10 or 12 years ago.

5216. Was it in 1849 or 1850?—I believe it was about that time.

5217. Are there any common lodging-houses in the town?—Yes.

5218. Are they regulated under the Common Lodging Houses Act?—I believe so; they are visited by the inspector of nuisances.

5219. What is their condition at the present time compared with what it was before the Common Lodging Houses Act was passed?—The houses are very much cleaner; the worst one was pulled down and a very excellent house was built on its site; it is not much occupied.

5220. There has been great improvement in that respect?—Yes.

5221. Has there been in consequence a diminution of sickness?—I think there has been a general improvement in the town; we have never had anything very serious, only a few isolated cases of fever. The town has certainly been improved since the Local Government Act came into operation; the pavement of the town is better, but still the surface drainage is not what it ought to be. In Amwell End in some of the courts I have understood that the fall is not sufficient to do what is necessary. I have reported frequently upon the state of the drainage, and that has been generally the answer I have received, that the fall is not sufficient.

5222. Have you ever been called in to attend poor persons in fever-stricken and overcrowded places, at night, for instance?—Yes; in the course of my prac-

WARE.

H. Butcher, Esq.

16 Jan. 1867.

tice I have been called up at night to go and visit them, but I do not know anything special about it.

5223. What kind of atmosphere have you generally found in those dwellings?—Very close indeed. I remember some years ago in a place called Caroline Court, which is now much improved, I had some severe cases to treat, but they were quite endemic cases; they were confined to that spot.

5224. (*Mr. Harrison.*) Can you call to mind any other cases, besides the one you have mentioned, of the water being polluted?—I cannot call to mind any others just at this moment, but there were one or two pumps, I believe, which were not situated very conveniently for the traffic, and which were closed; but the people finding it inconvenient to have them closed, I believe the board of health had them reopened.

5225. Knowing of these cases, and knowing also that the town of Ware is situated upon a substratum of gravel with a number of cesspools in the town, do you not think that the water is liable to be contaminated in the way you have mentioned?—I do not think it is.

5226. Why not?—Because I think that the pump which I have alluded to got contaminated from a privy that had been erected. I have never heard of any other pump or well being rendered offensive by any drainage.

5227. Have you had the water analysed?—No, I have not. With regard to the Hertford drainage I may state that nothing can look better; it is most inviting in appearance.

5228. May not that be the case in your town as well?—I have never heard any complaints made; on the contrary, everybody has praised the water and thought it most beautiful.

5229. (*Professor Way.*) You have been asked generally whether you have as a matter of fact traced any connexion between bad water and disease, and you said, "No"?—Yes, I say that personally I have not.

5230. Do you not believe that that is possible?—Yes; but I have not in my experience found any disease arise from bad water in this town; that is to say, I could not trace it.

5231. Do you believe or not that bad water will produce disease?—I believe it will.

5232. (*Chairman.*) Do you believe also that you may have bright sparkling water that shall not be wholesome?—Yes, I believe it is so; that it may contain any amount of poison, and yet be bright to look at; there may be oxalic acid in it.

5233. Would you be surprised to learn that into the river Lee there are tons of oxalic acid poured every year?—I was not aware of that.

5234. At Luton there is a population of 20,000; and in bleaching the straw plait and dyeing it they use oxalic acid, and tons of it in the course of a year pass into the Lee?—I have understood that some went in. We might also say that the surface drainage here would tend to pollute the river Lee, because there are barge loads of manure that are brought in and put upon the soil, and of course the first shower of rain may wash that into the river.

5235. Would not that tend to pollute it?—Yes, and it does.

5236. You probably know, from your own experience, that out of 1,000 people there may be perhaps only one who is affected by a particular medicine in a particular way?—Yes.

5237. So that an infinitesimal dose of that medicine will affect that person?—Yes.

5238. And so with well poisoning, there may be a great number of people with robust constitutions who will not be affected by it?—Yes.

5239. Have you anything further to add?—No.

The witness withdrew.

Mr. G. Hitch.

Mr. GEORGE HITCH (Ware) examined.

5240. (*Chairman.*) You are surveyor to the local board?—Yes.

5241. How long have you held that appointment?—Nine years.

5242. Do you do anything else but attend to the business of the board as surveyor?—Yes.

5243. What other occupation do you follow?—I am a barge builder.

5244. You are a kind of honorary surveyor to the local board, for which you receive 30*l.* a year?—Yes.

5245. What duties do they expect to be performed by you?—I superintend all the drainage, and I have to examine all the plans that are laid before the board.

5246. For new buildings?—Yes.

5247. You examine them to see whether the parties comply with the requirements of the Act or not?—Yes.

5248. Do the board meet fortnightly?—Yes.

5249. Have you devised and carried out any sewers yourself in the town?—I have carried out some of the branches, but not the mains.

5250. If persons wish to drain their houses into the sewers, are they obliged to give notice to the board, and deposit a plan of the proposed drains?—Yes.

5251. Do you see the connexion made?—Yes, I do, or I employ a man to do it; the board expect me to do it.

5252. Do you think that the sewerage and drainage of this town are at all as complete as they ought to be?—Not in all parts.

5253. Whereabouts are the sewers discharged; have you any plan?—I have no plan.

5254. How many outlets are there?—Five altogether; four into the navigation, and one into the old river Lee.

5255. Four of them pass their contents into the navigation, and one into the old river?—Yes.

5256. Do you know how many waterclosets there are in the town?—220.

5257. In what class of houses are they principally to be found?—Principally in the best houses.

5258. Are there any waterclosets in any of the cottages?—In some instances, but they are not supplied with water, they have pans.

5259. They cleanse them by throwing down buckets of water I suppose?—Yes, there are 60 of those out of the 220.

5260. In your experience how have you found them to answer?—They answer very well if they are properly attended to.

5261. Do you consider that they are an improvement upon the cesspit?—Yes.

5262. Is it your duty to examine and report as to the position of a cesspit or cesspool and well when a new house is about to be built?—Not as to the position of the well.

5263. Take any private house that you know, and suppose that you have within the area of this room a well in one place and a cesspool in another, how far apart would they be?—I have allowed them to put a cesspit within 30 feet of the well.

5264. Are the cesspits absorbent; do they drain away or filter away the water?—No, all the new ones have been cemented and made tight.

5265. Do you think the old ones are tight?—I do not know.

5266. Have any complaints been made to you that the water of a well has after some time become disagreeable?—Yes, in one or two cases.

5267. What do you suppose the complaint has arisen from?—In the case that Mr. Butcher referred to, it arose from a privy that had been erected some years ago close to the well.

5268. The privy was contaminating the well?—Yes, I expect so.

5269. When these watertight cesspits are made in new houses, do you make overflows to take the surplus water away into the drains?—No.

5270. Then when they get full, what do you do with the contents?—They are emptied, and the contents are taken away in a cart provided by the board of health.

5271. When they are being emptied, is there much foul smell?—I do not know, I have nothing to do with them then.

5272. Are your sewers ventilated upon any principle?—Not at all.

5273. Do you think that that is a state of things that ought to continue?—No; I think that they ought to be ventilated, but that has never been done; I have never heard any complaints about it.

5274. Do you know that there is occasionally fever in the town?—Yes.

5275. Do you know whether fever has occurred in the houses that are drained, or in the houses that are not drained?—The special case that has been brought before your notice by Mr. Butcher was in a house that has no drainage at all.

5276. Have you known a fever to occur in houses where there were drains?—I cannot call to mind any cases at this moment.

5277. (*Mr. Harrison.*) Do you remember when the main drains in the town were constructed?—No.

5278. Do you think that much spring water gets into the drains?—Yes, in the lower parts of the town.

5279. You think they discharge a good deal into them besides what passes in from the houses?—Yes.

5280. Are most of the back premises and cottages connected with the drains?—Yes, most of them.

5281. All the slops I suppose pass into the drains?—Yes, all that goes in. There is a part of the town called Musley where there have been some new houses built; there are at least 10 or 12 houses which are not drained at all.

5282. What becomes of the slops from those houses?—They are thrown out on to the surface.

5283. (*Chairman.*) Do you know that your Act gives you power to give those parties notice and to compel them to drain, or you may drain for them if you have a sewer within 100 feet of the houses?—Yes.

(*Mr. Cobham.*) I may mention that the board once served notices upon all the owners in that part of the town to make a drain to join the other drains, but it was not carried out I believe on account of poverty.

5284. (*Mr Harrison to the witness.*) You are, I understand, a barge builder on the navigation?—Yes.

5285. Do you find that any nuisance arises from the river?—Never; and I live in the lower part of the town.

5286. Below the mill?—Yes; my yard adjoins the tumbling bay as it is called, and I never smell anything.

5287. (*Mr. Cobham through the Chairman.*) Have you ever known any nuisance arise from the sewer since you trapped it?—Not the least.

5288. (*Mr. Harrison to the witness.*) Have you ever had your attention drawn to the state of the river where the sewage of Hertford comes into it?—Yes, I have several times, and I cannot say that I have experienced a nuisance from it. There is a lot of scum that arises which I have noticed at different times, and that is very offensive.

5289. Have you observed any similar notice in the river at the points where the sewage of Ware is discharged into it?—I have never noticed it.

5290. (*Professor Way.*) Do you think the quantity of the subsoil water which flows through the gravel and gets into the drains is very large?—Yes, it is in places; there is a great quantity in our sewer.

5291. In fact that sewer acts as a subsoil drain?—Yes it does, as far as it goes.

5292. If that is so, I suppose, so far as one can judge, such a quantity of water would alter the appearance of the sewage and filth?—I think it would.

5293. It does not prove that the sewage does not pass down because the water is comparative bright and clear?—No.

5294. Is it the case generally throughout the district that there is a large quantity of subsoil water which passes underneath the houses?—It is so in the sewers in the lower part of the town, but not in the upper part of the town.

5295. With regard to the cesspools, do you think they drain away rapidly?—Most of the new ones are cemented and made watertight.

5296. Do you mean that the water neither gets in nor gets out?—No, it gets in, but it is taken out by the night carts; as to any of the old ones, I do not know how it is.

5297. How often are they emptied?—That is according to the size of them. I do not know about that; they never apply to me; they apply to the inspector of nuisances.

5298. Do they often require to be emptied, or do the contents drain away into the gravel?—That I cannot say, but I suppose on the average they would require to be emptied once or twice a year.

5299. What was the object of cementing some of them?—To prevent anything from the soil draining through.

5300. I suppose it is understood that the connexion of a well with a cesspit is not a desirable thing?—Yes.

5301. And yet you say there are many cases in the town where wells and cesspits are near together, and the cesspits are not cemented?—I have no doubt that many of the old ones are not cemented.

5302. (*Mr. Harrison.*) You have stated that the sewers in the lower part of the town take in a large quantity of spring water, but that those in the upper part take none?—I did not say a large quantity, but there is always a slight drainage.

5303. Are you ever called upon to clean out the sewers in the upper parts of the town?—Never.

5304. In opening the ground to make connexions have you ever found any difficulty in those parts of the sewers?—No, they are all clean, and I attribute that principally to the quantity of cistern water that runs through them from the maltings.

5305. (*Chairman.*) The river Lee flows through Ware?—Yes.

5306. Is the town built upon both banks of the of the river?—No, only on one side; the other side of the town is Amwell End.

5307. Are there any houses or other properties situate on the margin of the river?—Only the malting trade premises, besides Ware mill.

5308. Are there any privies on the banks of the river?—Yes.

5309. Does the refuse fall direct into the river?—Yes, in some instances it does; in a few of them.

5310. In how many instances do you think?—I should say from 12 to 15.

5311. Can you name the places where they are, or upon whose property they are?—There is one on what is called the back ditch belonging to Mr. Wilkins, and there is one belonging to Mr. Lawrence.

5312. Do you think there would be any difficulty in altering the arrangement so as to prevent the refuse going into the river?—Only by making a cesspool, or by draining those places into a sewer.

5313. Have you not power to give the proprietors notice to prevent that drainage passing direct into the river?—I do not know whether we have.

5314. Is there any portion of the town where the streets are paved?—Yes, the main street is all paved.

5315. What is it paved with; sets or boulders?—Berk Hill paving.

5316. What does that cost per square yard?—We get it down at about 9*d.* a square foot, but the greater part of it was done by contract; what I have done since cost about 8*d.* or 9*d.* or 10*d.* a foot.

5317. Was that the actual cost of the stone?—Yes.

5318. What does it cost to lay it down?—The board keep a man constantly employed to do their works, and he does it for them.

WARE.

Mr. G. Hitch.

16 Jan. 1867.

5319. What does it cost per square yard to lay it down?—About threepence.

5320. Are the footpaths flagged?—Yes, I mean them.

5321. I was speaking just now of the cart road?—There is no cart road that is paved.

5322. That is all macadamized is it?—Yes.

5323. What do you make it with—flint?—In the main street it is all granite.

5324. Where do you get the granite from?—From London.

5325. At how much a ton?—I cannot say exactly, perhaps 15*s.*

5326. Do you know how many square yards of road a ton will make?—No, I have nothing to do with the roads.

5327. What do bricks cost per 1,000 here?—About 35*s.*, at this time they are rather more, they are 1*s.* more now per 1,000.

5328. Are they dearer now than they used to be 20 years ago?—Yes.

5329. Do you think that bricks are cheaper because the duty has been taken off?—No, I know that we pay quite as much.

The witness withdrew.

Mr. T. Garratt.

Mr. Thomas Garratt further examined.

5330. (*Chairman.*) You were examined at Bishop Stortford, and you live at Hunsdon Mills?—Yes.

5331. I understand you wish to make some corrections in your former evidence?—Yes.

5332. Upon what points do you wish now to speak?—The evidence that I gave before was upon the pollution of the Stort, but I was asked whether I had any evidence to give upon the sources of the Lee and the Mimram. I described to you then the state of the Stort, and the evidence that I omitted to give then was that which I will now supply, viz., that a great deal of sheep washing is carried on in the spring of the year, and from that cause I have known the fish to die.

5333. In which river, or at what point is this sheep washing carried on?—I think there is scarcely a single place on any stream near Hertford where sheep washing is not carried on; it is carried on at nearly every point.

5334. In what months does the sheep washing take place?—In May and June.

5335. When the sheep are washed in the streams is there something that comes from the wool that is poisonous to the fish?—Yes, on the river Mimram some years ago there used to be at a place called Kimpton Mill, about 7,000 sheep washed, and in one year we had a great many trout in the river, and I can remember that after the washing there were 13 or 14 trout picked up dead. I believe nearly every farmer dips his sheep in the autumn, and in doing that, for every score of sheep it is necessary to use from 4 lbs. to 6 lbs. of dippings with a great deal of brimstone and arsenic.

5336. What is the object of the dipping, what does it do for the wool?—It kills the ticks and poisons the insects. The sheep get lousy in the summer time, and the dipping kills the fly, and prevents the scab, or the maggot; then that is retained in the wool until the spring comes when the sheep are washed before shearing; it improves the growth of the wool but it is certainly then washed off. On the Stort I washed some sheep this last spring, and after that I saw the gudgeons and small fish quite sickly on the top of the water.

5337. Are there any other points that you wish to speak to?—I told you I think that at Welwyn and Whitwell there is scarcely a house where the privies and waterclosets are not drained into the river.

5338. And the sewage goes down with the water?—Yes, the Mimram is the clearest stream that runs into London if it is not polluted. I have lived upon it for 20 years, and I never yet saw it overflow its banks; it rises through veins of chalk, and it would be one of the finest trout streams were it not for the pollution from a tan yard at Whitwell that used to run in; the lime used to kill some of the trout.

5339. What number of barges pass Hunsdon Mill down the Stort, or what number did pass during the years 1862, 1863, 1864 and 1865?—I receive a toll for every barge that goes down the river Stort. The proprietors of the barges send me a toll of 1*s.* for the journey of every barge, less 2*d.* for collection, which makes it 10*d.* In 1862 there were 720; in 1863, 732; in 1864, 745; and in 1865, 757 that went the journey up and down. I believe there were about 10 or 12 more that came up from the Lee as far as Roydon, or Roydon station.

5340. What is the size of the lock above your mill?—It is 92 ft. long, the width at the bottom is 14 ft. 6, at the top 36 feet. I have always complained that there was a great waste of water on the river from there being no Commissioners; every dispute between the millers and the proprietors should be settled by the Commissioners, but some years ago the Commissioners died; they allowed them to die off, and no fresh ones were appointed, it was under the 32nd Clause of their Act that the disputes between the millers and the proprietors were to be settled by the Commissioners. I have complained several times to the Stort proprietors about the great waste of the water, for I consider that each lock takes much more water than it ought to do.

5341. Have the locks any side walls?—The Roydon Mill has, but the Hunsdon Mill is made wide at the top and tapering down. Under the Act of Parliament they are bound to compensate me for the full loss of my water. I mean through the Commissioners, but as they have allowed the Commissioners to die off, I have no resource, no claim, unless they appoint Commissioners. It was stated by one of the witnesses at Bishop Stortford that the millers were under a penalty of 20*s.* for refusing to comply with the navigation orders, but it is 40*s.* through the Commissioners as provided in the 6th George 3rd, Chapter 78, Clause 8. This is a private navigation and has nothing to do with the Lee.

5342. Have you anything further to state?—No.

The witness withdrew.

W. Parker, Esq.

William Parker, Esq. (Ware), examined.

5343. (*Chairman.*) Where do you reside?—At Ware Park in this parish.

5344. How long have you known Ware?—For 35 years; I have lived here for 25 years.

5345. Do you know the condition of the river Lee?—Yes.

5346. Are you officially interested in the Lee?—Yes, I am a trustee.

5347. Do you attend the meetings of the Trust?—Yes.

5348. The river Lee I assume is managed principally as a navigable river by the trustees?—Exactly so.

5349. Is it any part of your duty to preserve the water of the Lee pure for domestic purposes in London?—In a very recent Act of Parliament there is a clause to prevent draining into the Lee, but it has been found very difficult to carry out that power.

5350. Do you know that drainage is still passed into the river?—Yes.

5351. Is it not desirable that that should be miti-

gated or prevented?—For the navigation I do not think that the drainage into it is objectionable.

5352. Do the trustees receive any beneficial income for the water supplied from the Lee to the metropolis?—The water of the Lee in its present state has been sold to the New River Company and to the East London Waterworks Company.

5353. Is there a sort of rental paid for it?—Yes, for certain given quantities.

5354. Taking that as a precedent, and assuming that it is necessary further to purify that water for consumption in the metropolis, might there be an equitable arrangement come to, if Parliament empowered the trustees to effect certain improvements, the expense of which the water companies of London were willing to meet, and would the trustees undertake to discharge the necessary duties?—I have no doubt of it.

5355. You are an unpaid body of trustees?—Yes.

5356. Your servants are paid?—Yes, and that is all; it is very much like the old system of turnpike roads, we are an unpaid body, and we meet in order to see that the navigation is kept in repair.

5357. (*Mr. Harrison.*) I presume you look upon the navigation as a benefit to the whole country?—Yes.

5358. (*Chairman.*) Do you consider that it confers a money value upon the estates which lie adjacent to it in the different districts through which it passes?—Yes.

5359. And that it confers a benefit upon the property situate in this town?—Certainly.

5360. Then the whole property of the town has a value, a portion of which is represented by the accommodation afforded by the river Lee?—Very largely so, and I believe that the town would be destroyed if the Lee was annihilated.

5361. As a navigable river?—Yes.

5362. Are you aware nevertheless that this town deriving such large benefits from the Lee pollutes the river by draining its sewage into it?—The river Lee is a natural drain or sewer.

5363. It is a natural watercourse to which all the waters of the district flow down?—Yes, on both sides.

5364. Cannot you imagine an arrangement by which an interception might take place, and the sewage of a town like this might be prevented from flowing into the Lee?—I think it is very desirable that it should be done, and I think it might be done by having intercepting sewers on each side of the river.

5365. If the trustees of the Lee had adequate powers given to them by Parliament, and an equitable arrangement was made by which the necessary funds were furnished, do you think there would be any difficulty?—I do not think so.

5366. You could preserve the navigation, and you could vastly improve the town without doing injury to any person?—I believe that the town would not be improved unless there was a better water supply.

5367. Is not that question rather for the inhabitants of the town?—It is a question of cost. When this district was put under the control of the Board of Health I was chairman of that board, and the question, of course, came before us in every aspect, not forgetting, of course, the expense, and we employed an eminent engineer to survey the district with a view to a water supply and drainage, but the cost appeared to be so great that it was really thought it would ruin the town.

5368. A good water supply, I presume, you will admit, is essential for the health and comfort of the inhabitants?—Yes.

5369. Do you not think, if it could be proved that the inhabitants might be supplied with water, say, at 10*s.* per annum, to be delivered by high pressure and constant service into any room of a house, that the well and the pump would be an extravagant mode of doing it, compared with a supply within the house at 10*s.* per annum?—I think it would be desirable to obtain such a supply, and to get rid of the well.

5370. If it can be shown that waterworks might be established in this town, and that water might be delivered within the four walls of a dwelling at the price I have named, would it not be most desirable to obtain it?—Yes.

5371. Every gallon of water weighs 10 lbs., which involves extra labour for servants, and we know that a pump and a well are liable to contamination from many sources?—Yes, there are in this town many distinct wells; it is a poor town, and there is a large number of the labouring population in it; the cost of supplying them with water is nothing at all; it is more the cost of shoe leather.

5372. If you could furnish to the inhabitants of those cottages an abundant supply of water at 1*s.* a quarter, less 25 per cent. if paid by the landlord, the well and the pump would become a nuisance?—Yes, but I have no doubt there would be great difficulty in raising the necessary capital for the works. No doubt it would be beneficial, if the money was forthcoming, to raise 15,000*l.* or 20,000*l.* for this town; but if that were attempted to be done you would drive many of the inhabitants out of it. We should have to levy 1*s.* or 1*s.* 6*d.* in addition to 3*s.* or 4*s.* for poor rate.

5373. You probably heard it stated this morning that fever is prevailing in several parts of the town, that typhus fever, typhoid fever, measles, and scarlet fever have occasionally prevailed, and that there is a large infantile mortality?—Yes.

5374. I believe you are deputy-chairman of the quarter sessions?—Yes.

5375. Does that bring you into collision with cases of pollution or of nuisances caused in the county?—No, nothing except what has occurred under the late cattle plague arrangements. We have had occasion to prohibit the passing of manure.

5376. While you acted as chairman of the local board in Ware what were your practical difficulties in carrying out sanitary works; had you to discuss at the board what you must or not do in order to avoid getting into a dilemma, as the Hitchin people did?—Yes, I think our great difficulty was a want of funds and a proper outfall. We had the district surveyed, and I was very anxious that a reasonable sum should be raised in order properly to supply the town with water, but the sum that it was found would be requisite was so great that the board generally objected to it, and the inhabitants particularly. I do not believe they would have returned any member to the board who would have been favourable to carrying out that scheme.

5377. At what rate of interest did you borrow the money that was laid out in sewerage?—5 per cent.

5378. That, with a sinking fund, I suppose, would bring it up to nearly 7 per cent.?—Not quite so much.

5379. If Government could be induced to lend money for sanitary purposes at 3½ per cent., and take it back by annual instalments, extended over a period of years, would that be a relief to you?—Yes, no doubt of it.

5380. We know that ratepayers are sometimes alarmed about rates, because they do not see the advantage to result from money being advantageously laid out?—Quite so, but really my opinion is this, that those who get a better commodity should pay something more for it—that is to say, if the river Lee trustees have sold the water of the Lee to the London water companies, and in future should get by arrangement a better supply of water, they should pay something more for it. I think that that would be fair and equitable.

5381. (*Professor Way.*) Provided there is no right on the part of any person to foul the water?—I hope we shall not get into law, but I do not think this district will give up their legal right.

5382. The question is, whether the people have a legal right to foul the water of the river?—They have a prescriptive right to use the river, that is what

WARE.
W. Parker, Esq.
16 Jan. 1867.

I understand. Then again a concentrated drain is far worse than drains which enter at different points; we see that exemplified in this district by the drainage of the New River Company coming in and poisoning the water most terribly with what I may call the concentrated essence of the sewage from Hertford.

5383. A number of outfalls merely have the effect of distributing the nuisance so far as the people residing near are concerned, but what do you say as to the people who reside many miles below; would the number of outfalls here make any difference to them?—Yes, a great deal more water comes in with the foul matter.

5384. If a certain quantity of sewage is poured into the river 20 miles above, does it matter whether it comes in through five pipes or 20?—That is the question.

5385. It appears to me to be a distinction without a difference?—I think there is a difference.

5386. Do you think that you have a prescriptive right to throw what dirt you like into the river Lee?—No, but I think I have a right to use a drain as it has been used from time immemorial.

5387. You think that you have not only a legal right, but a moral right?—If I thought it was injurious so to use it, I think I should not have a moral right.

5388. (*Mr. Harrison.*) I believe the law is that no length of time can legalize a nuisance?—Yes, I think it is so.

5389. Therefore you can never gain a prescriptive right to commit a nuisance?—Yes, but the question is, what is a nuisance?

5390. (*Chairman.*) I believe you are the proprietor of large brick-fields in this district?—Yes.

5391. Do you employ the river largely for carrying purposes?—My tenant does.

5392. Do you bring the materials up from London, the breeze, and so forth?—Yes.

5393. And are your bricks taken down?—Yes, in very large quantities.

5394. What do you get per 1,000 for them?—There is such a variety of makes; the price varies according to the kind of bricks.

5395. Do you know the character of the land in the neighbourhood?—Yes.

5396. Do you remember any plans being prepared for storage reservoirs in this district?—Yes, very elaborate plans were got up by Mr. Rendel.

5397. Did you form any opinion as to the advisability of constructing those storage reservoirs?—I thought it most desirable that reservoirs should be constructed.

5398. If the water companies could construct them, I assume that they might have comparatively pure water for the supply of London?—Yes.

5399. Instead of taking the water of the Lee?—Certainly.

5400. Do you know the sites upon which those reservoirs were proposed to be made?—Yes, I know two or three of them. I think one was in Hatfield park, the intention being to stop the water of the Lee.

5401. Would the Marquis of Salisbury allow that to be done?—I think it would be a question with all of us, a question of compensation, and whether the reservoirs were made ornamental or not, and so as not to be left entirely dry at times, and so on.

5402. It would be a question whether the embankments were so constructed, and in such a position, as to be safe?—Certainly.

(*Mr. Marchant.*) The Marquis of Salisbury was a strong promoter of the scheme.

(*The witness.*) I may mention that I am chairman of the Regent's Canal Company, which is a very large navigation in point of tonnage, and the whole of the water which is supplied to that navigation, except what comes from the Grand Junction Canal and in very dry seasons from waterworks companies, is storage water; there is one reservoir covering 220 acres, and capable of storing 70,012,000 cubic feet of water.

5403. Could you obtain from your engineer a return as to the tonnage which is passed along that canal, and as to the volume of storage water?—Yes, without any difficulty. I could give you the revenue now, but I will furnish you in writing with the length of the navigation, its tonnage, the area covered by the reservoirs, the cubical capacity of the reservoirs, the annual volume of water used, and the area of the gathering grounds. The valley of the Lee from which all these rivers come is like a sponge; it contains a vast quantity of water, of excellent quality, and if the river was deepened, and the storage water used for the navigation, I think, then, that the spring water might be taken to London, and the navigation be entirely supplied from the reservoirs.

5404. You think that the spring water should be preserved for the supply of the metropolis, and the navigation proper should be supplied from the catchment reservoirs?—Yes.

5405. All you want is water in the navigation to work the lockage?—Yes.

5406. (*Mr. Harrison.*) Still, I presume, you would not approve of the towns discharging their sewage and other refuse into the navigation?—No; but, as I have said before, you must consider the money question. We are very poor in this district.

(*Mr. Mylne.*) The trustees' scheme of 1851 contemplated storage reservoirs of 994,000,000 cubic feet. The reservoirs were to be on the Ash and the Rib—one in Amwell marsh, two on the Lee, one above the other, on Roxford farm, and the other above Hatfield park, and a small one near Ware mill lock, which is not included in the 994,000,000 of cubic feet. The Ash and the Rib were to hold 500,000,000 cubic feet.

5407. Would those reservoirs receive chiefly spring water which would be almost entirely free from pollution?—They were to be catchment basins for a certain drainage area, taking in the surface water and spring water.

5408. Do those areas contain a very sparse population as compared with other districts?—I do not refer to the Lee Proper. There is Luton and Dunstable.

5409. Was it part of the scheme to divert the sewage of Luton?—I do not recollect the details of that scheme.

(*Chairman.*) To what amount of tonnage do you restrict your tenant?

(*Mr. Rydon.*) It would come to about 25,000 or 28,000 tons that I am to pass up and down annually.

(*The witness.*) I have made a private cut of my own for other purposes, which would perhaps bring 10,000 tons out of the river Lee into my own ground at my own expense.

5410. Upon that cut you would probably convey something like 10,000 tons per annum?—Yes.

5411. Making about 35,000 tons in all?—Yes.

5412. (*Mr. Harrison.*) You probably know that there are at the present time upwards of 40,000,000 of gallons of water taken in from the Lee to London daily for drinking purposes by different water companies?—Yes; this may be so.

5413. That forms a very large proportion of the whole supply given to London. From the Thames they take only 48,000,000 of gallons?—Yes; this may be so.

5414. Therefore the Lee is one of the most important sources of supply to London?—Yes.

5415. Do you think that the formation of reservoirs such as you have mentioned, which would hold 994,000,000 of gallons, or about 25 days supply, would be the best means of providing a supply at present for London?—No. I think that the river ought to be deepened. I believe that the whole valley is like a sponge, and that the water does not get away.

5416. What steps do you think it would be advisable to take to put the river Lee under good management, so that it might be made in the highest degree beneficial to the public, both for the navigation, and for a

supply of water?—I think there should be a good engineer to manage it, that the navigation should be deepened, and the locks enlarged, in short, that Mr. Rendel's plan should be, to a great extent, carried out. I would lessen the number of the locks, lower the bed of the river, and save the water that would otherwise go away by evaporation and in other ways.

5417. Under what kind of management would you place the whole valley of the Lee in order to attain those ends?—It is a difficult thing to say what it would be best to do.

5418. Are you at present one of the trustees of the river Lee navigation?—Yes.

5419. Do you think that the river Lee trust would be able, with extended powers and adequate authority, to carry out a system of the kind?—I should say that there ought to be a joint management. I think this, that those who have an interest in affairs of this kind, generally manage them better than those who have not. Some of the members of the New River Company are *ex-officio* trustees of the river Lee trust.

5420. Do you think that the whole valley of the Lea is in an unsatisfactory state?—Yes, I think it is.

5421. Would you be inclined to carry out a system of drainage throughout the valley as it exists?—Yes, and get rid of many of the mills. Many of them in Hertfordshire are extremely detrimental, not only to land, but to the value of property where the water is headed up.

5422. Is it at times the fact that water so headed up by mills injures a larger amount of property by flooding, there being a want of drainage, and does more damage than the mill itself is worth?—That is a question I cannot answer, for it is very difficult to ascertain the injury that is done to land by these heads.

5423. (*Chairman.*) Do you know that there are certain mills which do inflict injury upon the adjoining land, and do impede the drainage of the valley?—I should say that every mill in the county more or less does so. I do not know of one that heads up the water and does not injure the land adjoining.

5424. Are you not of opinion that we have glided into an age when steam may fairly be said to have superseded water power?—Yes, I think so.

5425. And probably it would be much better to sweep away the mills and substitute another form of power, water mills being now out of date and things of the past?—Certainly; and it is very much the fact of railroads passing nearer to modern mills which has made the older mills valueless, cartage to any station being too far.

5426. In the primitive state of the country, when there were few roads, and land had a very small value, and when people had comparatively no knowledge of artificial power, mills were a necessity?—Yes.

5427. They were put up to grind corn and make flour for the people of that period, but now machinery and the means of rapid communication by railways enable you to bring flour from distant parts, and the necessity for a mill no longer exists?—That is very much so.

5428. A mill now blocks the drainage and injures the adjoining land, to what extent you cannot say?—No.

5429. You can say that it blocks the drainage and injures the adjoining land?—Certainly.

5430. (*Mr. Harrison.*) Do you think that the river Lee trust might be re-constituted, and a board be formed that should at once improve the whole value of the Lee by carrying out drainage works, maintaining the navigation, and provide at certain points, to be carried away by water companies, a large supply of pure water for London?—I think there is quite material enough to carry that out.

5431. How should you say that funds might be raised to carry out those several objects?—Funds would be raised by showing that the scheme would be a profitable one.

5432. If you were to carry out drainage works, it would be necessary to have taxation in some form or other?—Yes.

5433. Upon whom would you levy the tax?—I think it should be divided in portions—for instance, I should say, if a town was drained, a third of the amount should be contributed by the town drained, and two-thirds by the London water companies who would get a better supply of water, and so divide it into small sums. Again, if you could show that the land was benefited, I would place a small tax upon the land.

5434. (*Professor Way.*) Your point seems to be, to exact from the metropolis some contribution towards purifying that water which you have made impure, and the more impure it was the more they must pay?—No, I do not mean that.

5435. You seem to argue that you have a right to make the Lee impure?—It is impure; and let me mention, that there was a negociation of a business-like character carried on between the East London Water Company and the New River Company, and they made a bargain, and surely if the bargain had been, you must first purify your water, we should have said, very well, let this arrangement stand over for a time, and we will ascertain what the expense will be, and when we have done that, we will make you pay for it accordingly.

5436. The question is whether anybody has a right so to use the water as to abuse it and pollute it. If you say that you have a right so to use the water, there is an end to the question?—But we do not do it.

5437 I presume that none of the people here would wish to represent through this Commission that they consider they have a right to make the Lee impure?—Yes, they do. I maintain that we have a right to drain into the river Lee.

5438. And a right to make it impure?—No, I do not say that.

5439. The opinion which you have expressed you would probably not apply to another river in which you had no interest?—I think it would be a question for the House of Commons as to what sort of Bill should be passed to deal with those matters.

5440. It is not a question of principle with you, it is a question of pounds, shillings, and pence?—We must consider the expense.

5441. (*Mr. Harrison.*) With regard to the constitution of the river Lee trust, do you think that that trust represents local interests as fully and as sufficiently as you would wish?—Yes.

5442. (*Chairman.*) If you had such important duties entrusted to a board as those connected with the conservancy of the river Lee and its tributaries, do you think it would be advisable that its numbers should be unlimited, or that its jurisdiction should not be clearly defined?—I think the question is whether these gentlemen are competent to carry out an Act of Parliament.

5443. If there is power to elect 500 people to qualify, the question is whether the Board would be as well managed by 500 persons who could so come in as it would be by 50 who came in by right, and could not be interfered with by any greater number?—I think the question is, is it advisable to limit the Board in its arrangements; we appoint committees and sub-committees.

5444. Are you a county magistrate?—Yes, and I am deputy-chairman of Quarter Sessions.

5445. Do you ever appoint any public officers?—Yes.

5446. Do you as deputy-chairman of Quarter Sessions attend pretty closely to your duties?—Yes.

5447. At the sessions or at any other meetings, how many magistrates on the average attend?—For the county business I should think probably 30 or 40.

5448. How many magistrates are there in the county?—I really do not know.

5449. 300?—Probably 150.

5450. Have you sometimes appointments to make in the county?—Yes.

5451. When you have an important appointment to make, how many magistrates usually attend to vote?—The post of Chief Constable I believe is the most

WARE.
W.Parker,Esq.
16 Jan. 1867.

popular thing in the county, and I believe all the magistrates muster then.

5452. You mean I suppose that those magistrates who transact the ordinary business of the county are not left to make appointments themselves, for those who seldom or ever come near at other times assemble numerously upon those occasions?—Yes, the Chief Constable is the constable for the whole county, A great deal of the county business is done at the Petty Sessions.

5453. Is the fact that the men who from their constant attendance transact the business of the county are over-ruled in the appointment of so important an officer as Chief Constable by gentlemen who never attend except on that occasion?—No.

5454. (*Mr. Harrison.*) Does not this matter require a little qualification, that although there may be only 30 or 40 magistrates who attend the Quarter Sessions usually, you will find five or six magistrates probably attending each of the Petty Sessions where they have to some extent the local management of the police?—Yes, of course that is so.

5455. Therefore the magistrates who attend each of the Petty Sessions are interested very materially in the appointment of Chief Constable?—Yes, and if there is any business connected with any part of the county—the county bridges for instance are an important question—then the Quarter Sessions are attended by every magistrate in that locality, and it is of great use and advantage for those gentlemen to give us their opinions, we are very glad to hear the opinion of the gentlemen living in the locality in which the business is required to be done.

5456. (*Chairman.*) Do you not find any practical inconvenience from having so large a Board in the transaction of business?—No, the only difficulty is this, that at times we do not get the same number of magistrates in attendance as we should like.

5457. (*Professor Way.*) Is not that a practical difficulty?—That is one. The chairman makes a point of attending and also the vice-chairman, and some others do the same.

5458. You have been asked by Mr. Harrison whether in the case of some conservancy body being formed for the valley of the Lee, the existing body of trustees would be fit and proper persons to perform the duties of such a Board?—Yes.

5459. Is it a fact that the Lee trustees at present consist of 60 or 70 members?—Yes.

5460. Are some 23 or 24 of them aldermen of the city of London?—Yes, all the aldermen of the city of London are *ex-officio* members.

5461. Are the other *ex-officio* members principally members of Parliament?—All the other *ex-officio* members are members of Parliament.

5462. How many members of the River Lee Trust altogether are interested in the land and property of this district, are the aldermen of the city of London so interested?—No.

5463. Are the county members interested in the land and property of the district?—The borough members are.

5464. Supposing that 24 members of the trust are aldermen of the city of London, and some 30 more consist of the members of Parliament for this district, some who are not members for this district, and others, what interest do you think preponderates?—The river Lee Navigation commences at Hertford, and we have the Marquis of Salisbury, the Mayor of Hertford, and we have two or three traders and the Ex-Mayor of Hertford. Mr. Squires is a trustee having a very large mill on the stream or two I believe. I come next to Mr. Baker who lives higher up above the navigation; he is a trustee, and his son also is a trustee.

5465. How many aldermen of the city of London have any interest in the matter?—I do not know that any of them have, but they come down sometimes.

5466. Have they any right to interfere in the business of the trust?—Only as *ex-officio* trustees.

5467. They form rather a large element in the trust?—Yes, then adjoining me Mr. Gosselin, a landowner, was a trustee. Mr. Puller is a trustee, and his son also; Mr. Page, the largest maltster in England, is a trustee, and in fact I do not know of anybody who is not a trustee, if he is thought to be a desirable man. The last trustee appointed was Mr. Baxendale, who lives about two miles from the river.

5468. Is it a fact that 30 members of Parliament are *ex-officio* trustees?—(*Mr. Marchant.*) I think you may take the number of members of Parliament at 10, they are only the members of the counties through which the river passes, and they are parties who live in the counties through which the river passes.

5469. (*Chairman to the witness.*) Do you think that the business of the trust would be worse managed if the number of the trustees was reduced to about 15, if the present trustees were made simply an elective body, and not an executive body, and that the first requisite for an acting trustee should be qualification by property, or interest in the district, or the navigation up to a certain sum; and above all things that he should be resident?—I think that that would be an improvement.

5470. So that the present body should elect the representatives who were to be the executive?—Yes, I dare say it would be better done then.

5471. (*Professor Way.*) Supposing a new arrangement was about to be made for the control and management of the river Lee, would there be any possible reason why 24 out of 60 or 70 members should be aldermen of the city of London and *ex-officio* members?—I should not think that necessary at all.

5472. (*Chairman.*) If Parliament should think fit to create an acting body of trustees, limiting their number, and putting more duties upon their shoulders, do you not think it would be just that Parliament should provide that at all events the members of the body should be repaid all expenses out of pocket like the Thames Conservators, for example that 1,000 or 2,000*l.* a year should be divided amongst the executive body who did the actual work of the conservancy, and not as a payment for services rendered?—You know better than I do, that if it comes a question of payment, you do not get the best working men from the men who are paid, on a trust of this sort.

5473. I do not mean men who are paid, but you are aware that in railway companies and other large companies an annual sum is voted to defray the expenses of the working directors?—Yes.

5474. Why should you be called upon to give up the whole of your time for the public of London to furnish a water supply, to look after the navigation, and the interests of the landholders above and below you, as well as your own small portion of it for no equivalent. How could the public expect you would do so heartily if you had to put your hand into your own pocket every time you attended a meeting?—It is part of the system of England that there should be a number of gentlemen so engaged, and I should be very sorry to see the duties of the magistrates of England put into the hands of those whom we paid for attending to them.

5475. (*Professor Way.*) The object of my questions was to ascertain whether your Trust was really a body which represented the interests connected with the river Lee, and whether, if any legislation should take place, we as commissioners would be justified in saying, we believe that the trustees would be the proper persons to carry out that legislation. For my own part I cannot see why 24 aldermen of the city of London out of a body of 70 should have any right to vote?—I may state that they do not attain that position without being men of very sound sense and having good heads upon their shoulders; and such men are extremely valuable.

5476. I presume it would be your object that the members of such a body should really represent the interests connected with the river Lee?—Yes, with regard to payment that is another question, or whether

there might not be a paid chairman, you would have to throw a great responsibility upon somebody, and if you could throw a great responsibility upon any individual, I think perhaps you might pay him.

5477. In the case of the river Thames, Parliament takes the conservancy as it exists, and makes its arrangements for the future treatment of that river, and if Parliament is to deal with the river Lee it may turn its eyes upon the present trustees as a fit and proper body to manage the river Lee. We are simply asking you whether you think, without considerable modifications, they are an eligible body for the purpose?—In my opinion they are quite capable of doing it, and as capable as anybody that can possibly be found.

5478. (*Chairman.*) One great question is, the question of numbers?—Yes.

5479. And when we are looking forward to the future, and we see that certain additional duties will have to be put upon some board for the preservation of the navigation and to maintain the purity of the water, the question is who is to constitute that board?—I have given you my opinion with regard to the present trust.

5480. You are chairman of the Regent's Canal Company?—Yes.

5481. Are the gentlemen who serve on the board and conduct the business of the Regent's Canal paid?—Yes; we receive 1,000*l.* a year among 15.

5482. (*Mr. Harrison.*) There are two questions here, first, whether you think the present trustees represent fully the local interests connected with the Lee, and secondly whether the same trustees would be a proper constituency to whom should be entrusted the power of electing a good working board say, of 15 or 20 members, and in order that they should not be out of pocket, whether a sum like 1,000*l.* a year to cover their expenses, might not be allowed?—I think that the body from which they are elected cannot be improved.

5483. (*Professor Way.*) For the present purpose, or for any future purpose?—For any purpose; for the navigation of the river Lee, or for any other purpose that might be entrusted to them. I think I stated before that there are some of the directors of the New River Company who are *ex-officio* members of the trust, the governor, the deputy governor, and the treasurer, they do not attend.

5484. Do you think that there is enough water in the valley of the Lee, not only to supply the navigation, but if properly managed to distribute a much purer supply of water to the inhabitants of London?—I think so.

5485. (*Chairman.*) Is there anything further you would wish to add?—Nothing else occurs to me at present.

The witness withdrew.

Mr. Albany Bond (Ware) examined.

Mr. A. Bond.

5486. (*Chairman.*) Are you inspector of nuisances in this town?—Yes.

5487. How long have you held that appointment?—About 3½ years.

5488. What duties have you to perform as inspector of nuisances?—I have to go round and find out any nuisances that may exist upon any premises, or within the district, and report them to the next meeting of the board.

5489. What power have you to interfere and to cause a nuisance to be abated, supposing that you find a nuisance very offensive?—Then I order it to be removed at once.

5490. Do the Board furnish you with funds to purchase disinfectants?—I have had them from Mr. Cobham, the clerk. We have them by order of the board.

5491. Do you obtain as much as you want?—Yes, as much as is required.

5492. With regard to the cesspits and cesspools, if you find them to be the cause of nuisance, what course do you take?—I call upon the parties to have them emptied.

5493. How are they to do that?—We provide them with a soil cart for the use of which they pay 2*s.*

5494. Where is the refuse taken to?—It is taken towards Ware Park and towards a brickfield; that is, it is removed out of the district.

5495. Do you sell it to farmers for manure?—No; there is a hole at the place I am speaking of, and a man covers it over with lime.

5496. But is it not useful as manure?—I should say so, but nobody cares about it here.

5497. Supposing you find there is fever in a house, what course do you take?—I generally take some of the disinfectants or chloride of lime, and have the rooms whitewashed after the patient gets better.

5498. Have you any other duties to perform besides those you have mentioned as inspector of nuisances?—Yes, I collect the rates.

5499. What do the rates amount to in the pound?—The present rate is 1*s.* in the pound.

5500. Do you mean 1*s.* in the pound for the half year?—Yes.

5501. Will the rate be 2*s.* in the pound for the whole year?—The present rate is 1*s.* in the pound, but I do not know what the next rate would be.

5502. How much does the 1*s.* rate produce?—About 800*l.*

5503. And the 2*s.* for the year would produce 1,600*l.*—Yes.

5504. Will you be good enough to explain for what purposes the rate is collected and applied?—(*Mr. Cobham.*) It is for the repairs of roads, and paying off the borrowed money, which is a very heavy item; also for the lighting of the town, to pay the salaries of the officers of the board, for any drainage that may require to be done, and also for paving.

5505. Does the 2*s.* in the pound cover all the local rates that are collected?—(*Mr. Cobham.*) It does, and it would do more than that; but the fact is that we were about to make some drainage works, and we were going to have 500*l.* borrowed by the board, but these works appeared to require such extensive plans that we thought proper to abandon the idea, and the rate was increased in place of borrowing the 500*l.* When I say the board, I mean the board in London. We increased the rate one penny in the pound by three rates, and by that means we avoided the repayment of the money we intended to borrow; therefore a 2*s.* rate is really more than the board want under ordinary circumstances. I think Mr. Bond has been rather misleading you as to the removal of the night soil; the truth is that the board charge 2*s.* for the use of the cart, and for the cart alone, but those who have the use of the cart may employ what men they like, with the exception of one man; they must pay one of the men, but they have a perfect control over him. They take the soil away, but we say they must take it out of the district, and when they have done that, they may do what they like with it. I believe that they sell it occasionally. I happen to know that when they can find a customer they do sell it.

5506. Is there anything further that you wish to add?—No.

5507. (*Mr. Harrison to the witness.*) What kind of place is it into which the night soil is tipped?—It is a gravel pit; the gravel has been taken out and it is filled up with soil, and then covered with lime.

5508. Is the soil ever removed from the pit again?—No, not generally.

5509. What is the size of the pit?—There is a hole here and a hole there just as they can get it in.

5510. Are these holes which have been made for the purpose of taking away the gravel?—Yes.

WARE.

Mr. A. Bond.

16 Jan. 1867.

5511. And in this way you fill up the gravel-pits?—Yes, with the soil.

5512. Do you find that you can go on tipping into one of these holes a large quantity of night soil for a considerable time?—Yes, perhaps it has been there for 12 months, and has subsided, and then they go again and fill it up again.

5513. Where are these holes situate with reference to the town?—They lie towards the Park.

5514. They are at a higher level, are they not, than the town of Ware?—Yes.

5515. Does the gravel bed into which you throw the night soil extend downwards, and join the gravel bed on which the town is built?—Yes, it does join it; it is on the borders of the road near the cottagers' gardens.

5516. As inspector of nuisances to the town do you consider that the operation you have described may become a nuisance to the town by the sewage draining towards the town through the gravel?—I should not think it would; time may perhaps produce an effect.

5517. You say that this has been done until the pit gets nearly full; then in the course of a year it will sink down, and the pit is ready to receive another supply?—Yes; and so they go round.

5518. The rains of summer, and the water that percolates through the gravel will have taken all that night soil somewhere or other?—Yes.

5519. Is it not quite possible that it may have been brought down again to the town of Ware?—It might have been so; but I am not sufficiently versed in such matters to be able to say.

(*Mr. Cobham.*) I feel perfectly certain that it does not do so. It goes away from the town nearly in a solid state in the first instance, and the next thing is that there happens to be a field of clay adjoining the gravel between the point where it is put into the pits and the town.

5520. In which direction would the gravel pit drain?—There seems to be a bed of gravel for some length, a very great bed of gravel. Mr. Parker's pits are on the one side, and the sewage is put in in such small quantities that I believe there is nothing to apprehend.

5521. (*Professor Way to the witness.*) Are there any vegetables grown near the town for the London market?—No, I think not; not to my knowledge.

5522. Is any manure brought from London to Ware?—Yes, occasionally by the river we have some.

5523. Can you at all account for the night soil being considered so valueless here that you have to throw it into a pit to get rid of it?—No; but no one will have it.

5524. Can you account for its being considered so valueless?—I cannot; if it was allowed by the board, I think that some of the farmers in the district would be very happy to have it on their land.

5525. But the fact remains that this quantity of sewage is thrown into pits just to get rid of it?—Yes.

5526. We have been often told in the course of our inquiries that the liquid part of manure is of no value, and that it is only that portion which remains in a solid state which is useful?—I believe that they are both of value in a certain sense.

5527. Is it not a curious fact that the stuff conveyed to these pits should not be considered worth buying for manure?—Yes, I have thought so.

5528. Do you think it probable that in consequence of these cesspits, whether they be cemented or not, being open to the water, the sewage gets so washed and diluted that it becomes of no value?—I do not fancy that that is the case.

5529. (*Mr. Harrison.*) The surveyor stated that the new cesspits which are formed are cemented, but that a great number of the old ones are not in that state?—Yes.

5530. Have you occasion frequently to call upon the persons owning the old cesspits, to clean them out?—Yes.

5531. Do they fill them up to the top?—Yes.

5532. How often are they emptied?—Some of them once in 12 months, some once in two years, and some according to the state in which they are; it is according to the height it is up to.

5533. Do you know that any of them into which refuse is thrown constantly are never cleaned out?—No, I cannot say that.

5534. How long have you known one of them to be used without being cleaned out?—Three or four years.

5535. (*Professor Way.*) Supposing that this sewage is not worth a farmer's purchase or even his acceptance upon any terms, and it has therefore to be thrown into the pits to be got rid of, does not that seem to indicate that something must have happened to diminish its value?—I am not able to answer that question.

5536. If it has been so impoverished as to be valueless, is it not plain that its value has gone somewhere else, for instance, into the sub-strata?—I suppose it may have done so.

(*Mr. Cobham.*) I may mention that the farmers used to bring a waggon and take it away when they where under no restrictions; or when a privy was emptied the contents were carried into the river Lee. When however they had to come under restrictions, and the night soil had to be removed between the hours of 12 and 4, that seemed to do away with the practice entirely; the farmer wanted a longer time to do it.

The witness withdrew.

Mr. A. Brown.

Mr. Alfred Brown (Ware) examined.

5537. (*Chairman.*) You are a miller I believe?—Yes.

5538. Where is your mill situate?—In the town of Ware, close to the railway station.

5539. What water power do you employ?—I have a steam-engine, and I draw water from the Lee for the purpose of the engine.

5540. What power do you use?—16-horse.

5541. What weight of coals do you use in a week?—I burn a variety of coals; sometimes I have sea coals and sometimes I use Midland coals.

5542. What weight of coals do you consume in a week?—I do not know exactly.

5543. Do you know how many hundred-weight you burn in an hour?—At a guess I should say that I consume perhaps eight tons a week.

5544. How many hours do you work?—Night and day at times.

5545. Is your's a high-pressure engine?—Yes, a high-pressure condensing engine of 16-horse power.

5546. How old is it?—It has been erected about 16 years.

5547. What did it cost you originally?—It is not my own, and I do not know exactly what the cost was, but I think the engine and machinery cost something like 1,600*l.* or 1,700*l.*

5548. How many pairs of stones do you work?—Five pairs.

5549. How many dressing machines?—Only one.

5550. What do you do with the ashes?—We make none, the coal is all burned down to clinkers.

5551. What amount of traffic in weight passes over the river Lee to and from your mill?—The Lee is very useful to me; it acts as a check against the railway company, and it is likewise useful to me as it enables me to get wheat from vessels lying in the Thames. The barges go alongside the vessels, and it is loaded from the vessels into the barges.

5552. You get the wheat up in that way, grind it, and return it in the shape of flour?—Yes, at times we have foreign wheat for the purpose of mixing with the country wheat from the neighbourhood.

5553. Do you suffer from the foul state of the river Lee at any time?—No, I have never done so. I draw

WARE.

Mr. A. Brown.

16 Jan. 1867.

water from the Lee for the engine; I have a well close by the engine, but that is so silted that I cannot use it; it cuts up the buckets and pumps, and I therefore draw water from the Lee on purpose.

5554. Are there any fish in the Lee opposite to your mill?—A great quantity of small fish; you may see thousands of them all round the place where the condensed water flows into the Lee; these are small fish, the large fish come up there after them.

5555. Are there any special points that you wish to mention to the Commission?—None that I know of.

The witness withdrew.

Mr. Henry Beningfield (Ware) examined.

Mr. H. Beningfield.

5556. (*Chairman.*) Are you a resident in Ware?—Yes.

5557. Do you carry on any business here?—Yes; I am a surveyor and auctioneer.

5558. Upon what particular points do you wish to give evidence?—Relative to the report which I have seen respecting the flooding of the Rye Meads at Stanstead. I noticed it in reading the evidence of one of the witnesses who was examined at Stortford. It was stated that the Rye Meads were now about to be enclosed, and that arrangements were made for their drainage. The question was specially put, and being somewhat concerned in the enclosure, I thought it would be advisable for you to know that such arrangements had not been made, that the valuer acting under the enclosure has received no instructions whatever to drain the Rye Meads, but simply to apportion them out to various parties. No arrangement whatever has been made for the drainage of the Rye Meads.

5559. Then, I suppose, if they are to be drained, that must result from some subsequent arrangement?—Quite so.

5560. Are there any other points that you wish to mention?—You may probably have noticed how immensely they do get flooded, and the fact is, that the water remains there longer than on any others, and I may explain that that arises from three different causes, first of all, the construction of the railway has very much limited and prevented the water from running away, but the greatest reason is the Stort river. There is no escape for the water from the Rye Meads, except under the Stort, and it simply goes through a small hole, that is formed, I believe, by a hollow tree, and all the water passes through it in that particular way.

5561. Therefore you think I presume that a comparatively small expenditure would give relief to a very large area that is flooded?—Yes. I may mention also that there is no exit from the Stort in case of flood, except that which passes through Roydon mill; any surplus water is thrown back as back water, and runs through the old back river, and so is thrown on to these Rye Meads.

5562. To whom do the Rye Meads belong?—The land is Lammasland, and it belongs to a variety of persons.

5563. I suppose it would be allotted to several people?—Yes. I believe that no effective drainage can be carried out unless the parties can agree upon some one plan. The valuer has applied for power to drain the meads, but the parties interested would not give their consent. This is all I have to mention.

The witness withdrew.

Mr. John Marchant, jun. (Hertford), further examined.

Mr. J. Marchant, jun.

5564. (*Chairman.*) You have some documents which you promised to furnish the Commissioners?—Yes, I produce an "Abstract of the receipts and payments of "the trustees of the river Lee" from the year ending 31st December 1856, and downwards to the year ending 31st December 1865. I have also appended a statement showing the result of the operations of the trust upon the revenue account, to show that the operations have been successful, and that we have not expended more than we were warranted in doing (*handing in the same*). Evidence was given at Hertford by Mr. Manser in which he seemed to reflect upon the management of the trust, and seemed to think that we ought to have in hand a large surplus to pay for any extraordinary expenditure. I show by the papers handed in that we have not overrun the expenditure. I will also put in an "Abstract of trade for the year end-"ing 31st of December 1865, showing the amount of "tolls received at different points upon the river" (*handing in the same*). I also produce the form that we adopted in the year 1864, to serve upon every person whom we found creating a nuisance in the navigation (*handing in the same*). We sent a number of these forms to different parties, but having no parliamentary power to carry them out, we found that they were insufficient.

5565. (*Professor Way.*) Will you be kind enough to state whether the trustees are changed from time to time?—Not by rotation, a change is caused only by death, unless on the ground of nonattendance for a certain period, that will disqualify.

5566. Are the members removed if they become disqualified in that way?—In practice they seldom return to act.

5567. How often is the body really changed?—It is difficult to say, because it is principally by death, almost entirely by death, that any change takes place.

5568. (*Chairman.*) Will it be fair to ask you whether you have formed any definite opinion, and that you wish to express, as to the constitution of the trust?—My opinion is distinctly this, that a certain limited number of trustees, or a limited body of any kind will generally act better than a body unlimited in numbers. The points which you have elicited to day from the witnesses go quite to this opinion, that you ought not to have so large a number that a majority can come in and swamp the rest upon any question by being whipped up at a particular moment. Such a power I think ought not to exist.

5569. In your opinion would a limited and properly defined body be better fitted for active work than an unlimited and ill-defined body?—As a general principle, I should say, yes; but we have not found any practical difficulty with the trust, it has worked marvellously well. I believe there were days many years ago, perhaps 30 years ago, when, if certain questions were coming on, there was a whip up, and those who were interested in the questions to be decided won the day as against the judgment of those who were not so particularly interested. I have heard my father say that there were days when 50 trustees were brought to a meeting by a whip up for particular purposes, and that is certainly not a condition of things which I think is desirable.

5570. You do not think it would be right that the acting working trustees, upon whose shoulders the burden of the business usually rested, should be, if some important arrangement was about to be made, overwhelmed by the votes of trustees who were usually dormant?—No; and if now such a thing were likely to happen, I should challenge the right of a trustee to vote, because I know that if he has absented himself for six months, he is undoubtedly disqualified.

The witness withdrew.

Adjourned.

Victoria Street, Monday, 4th February 1867.

PRESENT:

ROBERT RAWLINSON, ESQ., C.B., IN THE CHAIR.

JOHN THORNHILL HARRISON, Esq.

LONDON.

B. Denton, Esq.

4 Feb. 1867.

BAILEY DENTON, Esq., examined.

5571. (*Chairman.*) You are a civil engineer?—Yes.

5572. You are very largely engaged in drainage and other engineering works?—Yes.

5573. Has your practical experience been extended beyond England to Scotland or Ireland?—Yes; I have recently reported on the large estate of Connemara, in Ireland, belonging to the Law Life Society, and I have had many foreign works to report upon, both in Italy and France.

5574. How many years have you been in practice as a drainage engineer?—20 years.

5575. Have you any idea as to the acreage you have dealt with in round numbers, within a few 1,000 acres?—I should think something like half a million, in some way or other.

5576. I suppose I may take it for granted that in that area your experience has been in soils and subsoils of very varying and diverse characters?—No doubt; although my practice has not been so much in town sewerage, yet, I have had a share of that business also.

5577. Besides land drainage, I believe you have been consulted and concerned in carrying out river improvements?—Yes, considerably; district drainage, as I should term it.

5578. Including the improvement of river and streams?—Yes.

5579. I believe you furnished us with information about that in the evidence you gave before?—I did.

5580. Do you frequently find that land drainage to be properly carried out, involves the dealing with streams and rivers, and occasionally more or less with mills?—Decidedly, and in the evidence which I gave before this Commission with respect to the Thames Proper, I explained in what way the drainage of land was very much prejudiced by the condition of the rivers and tributary streams, and by mills. I also explained, I think, that there was a great prejudice against mills, which might be overcome if the proper treatment of rivers was well understood. I believe that drainage may be made the means of very much improving the water supply of this country, and by a proper division of the main valleys into subordinate districts, the mill power may be very much increased. In some instances the improvements I should suggest would involve the destruction of mills, but in many others it would lead to the improvement of the power of the existing mills, and to the establishment of new ones, which, in the aggregate, would amount to much more water power then now exists.

5581. In your land drainage operations, have you adopted and carried out what is termed deep drainage?—Uniformly.

5582. Does that mean deep draining of from four to six feet?—It means starting with a minimum of four, to suit the depth to the difference of subsoil, and in many instances I have gone from 10 to 15 feet deep for the main under-drains.

5583. Besides being acquainted with the valley of the Thames and the valley of Lee, are you acquainted with the other water sheds of England, such as the Severn or Yorkshire valleys?—I might almost say that my operations have extended nearly to every river shed in the country, because that is very nearly the fact. I know of very few rivers upon which I have not carried out some operations.

5584. Have you noticed in the public newspapers that in the last month or three months there have been very destructive floods, especially in the northern parts of Yorkshire?—Yes.

5585. Without pressing the matter further, is it your opinion that that state of things is a disgrace to us as a civilized people, and that we should have now to suffer such enormous destruction from floods in that part of the country?—No doubt, but the difficulty of dealing with it is immense, from the circumstance that the injury is accruing and is cumulative, and what may be a correct mode of dealing with it to-day may not be sufficient to-morrow, the addition of water from under-drainage very much affecting the question. I am also led to the conviction that under-drainage, which is various in result, is nevertheless so uniform in producing a benefit of one sort or another, that it is certain that all the wet lands of this country will be drained in the course of time. With the under-drainage of land, which should have the effect of reducing floods, there is necessarily an improvement of outfalls, by straightening and deepening and keeping clear the watercourses; and although the water of under-drainage is detained in the soil as the rain passes from the surface to the 4-feet drains, yet what is collected from the under-drains with that which flows over the surface to the outfalls, is so quickly discharged by the improvement of those outfalls, that the effect upon the rivers is great, and it will be greater every day.

5586. Are you aware that until this autumn it was a very popular opinion, at all events it was all through the Aire and Calder district, that floods had diminished; evidence was given day after day to that effect, and the witnesses seemed to anticipate that they would never have any more. But while this Commission was sitting, floods came that damaged them to the extent of thousands of pounds?—I am aware that that idea, founded upon ignorance, did prevail, but I have done my best to correct that impression, although my influence is very small.

5587. Do you really think that the under-draining you have spoken of affects so seriously the question of river flooding as to account for the damage which has been done by them?—I do not say that it accounts for it wholly, because there are many other causes, for instance, the silting up of rivers from the influx of sewage, and various effects which it will be necessary to take into account to explain it; but that the discharge from under-drainage now proceeding and accumulating every day does throw down the water at a greater rate than it did before is quite certain, although I admit at the same time that if we could deal with the under-drainage only, the floods would be diminished.

5588. Are you sure that it sends the water down more quickly in all cases than it did before?—Yes, as far as observation enables me to judge of it.

5589. Take as an example 10,000 acres of a retentive clay soil under-drained to the extent of 4 or 6 feet, and more or less porous, are you certain that from that area the flood water is sent down more quickly than it was before it was drained?—I should observe that I have gone very carefully into this matter and made experiments, which have been published in the Royal Agricultural Society's Journal, and I think I have shown to demonstration that the efflux of water out of a soil by under-drains is, after a repetition of rain for several days, almost uniformly half the fall in 24 hours, I therefore deduce from that, that if there are outfalls properly made to discharge that efflux into the river, and in addition to the water that passes

through the soil there is a large quantity of rainfall which never does enter the soil, which must in rapid rains and great falls pass over the surface without entering it; then the discharge of the under-drains, plus the surface discharge quickly let down as it is into the rivers by improved outfalls must lead to a great accumulation of water in the main valleys.

5590. (*Mr. Harrison.*) I think you mean that when the soil is thoroughly saturated from the surface to the drains, and so saturated that the rainfall subsequently runs off the surface simultaneously with the full discharge from the drainage pipes, then, after a continuance of rain the discharge into the river is greater than it was before the drainage was carried out?—Decidedly; but allow me to explain, even by repetition, what I would say upon this point,—when clay becomes full to repletion, that is, when it can hold no more, the water falling upon the surface acts in two ways, first coming upon the water in the soil it presses out and takes the place of the latter which is directly discharged and about amounts, as I have said, to half the rainfall; and secondly, that which cannot enter flows off the surface and goes away by what I call land gutters, and passes to the tributaries of the rivers, and by those down to the main valleys. Let me say again that this is a very important philosophical question; if the outfall discharged the water of under-drainage only, I think, upon the whole, floods would be diminished, that is to say, the number would be reduced, though when the rainfall exceeds a certain limit they would be increased in quantity of water.

5591. You mean, I think, that this excessive discharge into the rivers only occurs on rare occasions when there has been such a continous rainfall for days that the soil is thoroughly saturated, and there is a discharge from the surface simultaneously with that from the drains?—Exactly.

5592. That does not occur after most heavy rains?—Perhaps not.

5593. (*Chairman.*) To return to the river Lee, have you considered that river in all its tributaries with any particular view to the improvement of the streams, the water supply, and the land in the valleys?—Yes, I have, and the extent to which I have gone will appear from the evidence I propose now to give.

5594. You are aware that the Lee is a navigation for a considerable portion of its length?—Yes.

5595. That it also is a very large source of water supply to the eastern part of the metropolis?—Yes.

5596. The water of the East London Waterworks Company and the New River Company being entirely drawn from the Lee and its tributaries?—Yes.

5597. And that the East London Water Company and partially the New River Company are in some degree concerned with the navigation works, that is to say, that the water which they take has been used for navigation purposes before it comes to their lowest point of abstraction?—Yes.

(*Mr. Beardmore.*) That would apply to the New River Company to a very small extent.

5598. (*To the witness.*) Will you be good enough to describe the points to which you wish to draw our attention?—I should preliminarily observe that I was led into the question of the drainage of the valley of the Lee at the instigation of some of the landowners of the marshes of East and West Ham, including what is called Plaistow marsh. The plan which I now produce was prepared with a view to the formation of this area (*pointing to the plan*) into a district for its drainage which I have partially explained in the paper you have before you.

5599. (*Mr. Harrison.*) The object was to drain it so that it should become capable of being built upon?—Yes.

5600. What is the level of that surface (*pointing to the plan*) as compared with Trinity high water-mark?—The section that I propose to put before you, and which you may find useful will explain that particularly. This (*pointing to the section*) is the surface of the marsh, and this is Trinity high-water mark, that (*pointing to the same*) is Ordnance datum.

5601. The whole of this area appears to be several feet under Trinity high-water mark?—Yes; in fact it occupies something like a mean between the two, Trinity high-water mark and Ordnance datum.

5602. What is the difference between the two?—12 feet 6. The views entertained by the landowners at West Ham in consultation with me were, that this was a district essentially valuable for dwellings for the labouring classes, not valuable for a high class of buildings; that it was also peculiarly available for the establishment of obnoxious trades which we wish now to expel from the metropolis.

5603. Is it not now being built upon for that purpose?—No, I know of no buildings on the great part of the marsh, but that this is the right view is proved by the fact that at the present moment there is a bill before Parliament for the consolidation of the various gas companies of the metropolis. I believe it will be brought forward or encouraged by the Metropolitan Board of Works, whereby the manufacture of gas will take place in the parish of North Woolwich, adjoining the outlet of the northern outfall of the main drainage of the metropolis, with a frontage to Gallions reach, and with a line of gas pipes following as nearly as possible the line of the main drain which I have proposed for the drainage of the district, and over which I have proposed also to construct a road so as to open up this wide and large area.

5604. That line is about midway between the northern outfall sewer, and the northern edge of the Victoria Docks?—Yes. I bring these objects before the Commission because I really think they are worthy of consideration in any scheme of drainage that may be carried out. This area comprising 1,800 acres of land is particularly suitable for the dwellings of the lower classes and for the location of obnoxious trades.

5605. (*Chairman.*) You are aware perhaps that all this district of West Ham and part of Plaistow has been sewered?—I am quite aware of that, still the larger part of the land there remains in its primitive condition.

5606. (*Mr. Harrison.*) Are you aware that in the agreement or arrangement made for an outfall at West Ham at this spot (*pointing to the plan*) it was always fully intended that the sewage of West Ham should be carried eventually to a lower part down the river?—I was not aware of that.

5607. Is the drainage of the West Ham area coincident, to any great extent, with the area you have pointed out?—It is. I believe that the lowest part of the 1,800 acres I was first proposing to deal with is somewhere here (*pointing to the plan*) in the West Ham meadows.

5608. So that the natural fall is rather up the river Thames than down it, at that particular part?—Yes, the fall of the surface is contrary to the arterial.

5609. Could you make use of the West Ham sewerage system so as to continue it eastward over the remainder of the area, carrying your outfall to the northern outfall sewer near West Ham, and pumping the whole of the sewage into the northern outfall?—I consider it unadvisable to raise the sewage of this district into the northern outfall. I have considered that the Metropolitan Board of Works would object to it, and on grounds of my own reasoning I consider it objectionable. But I wish to state that while this was under consideration, the information sought regarding West Ham led me into communication with Mr. Marshall, of Stratford, the engineer to the local board of West Ham, and he suggested to me that with other parishes of the valley there should be a combination, and that a larger work should be the result; that my original plan, in point of fact, should give way to a more extensive system of drainage. Following that suggestion I was led into communication with Mr. Marshall, no relation, but one of the same name, the engineer of Tottenham, and the design

LONDON.

B. Denton, Esq.

4 Feb. 1867.

I first made was altered to suit the whole drainage of the valley. I think it right to mention that, because we desired to suit the interests of the various parishes. The original scheme that I had formed has very much suffered thereby, for what we might have done has literally now been stopped by the difficulty of dealing with a number of parishes. The result of this joint consideration of the matter was that without altering the site of the drain I proposed for the Ham marshes, but increasing its size and altering its character, it was prolonged up the valley to the Walthamstow marsh ,and from thence took the shape of a fork, passing to the east and west of the river and the navigation. This (*handing in the same*) represents the whole section of the valley; that is the Stratford sewer (*pointing to the same*) of which I believe Mr. Rawlinson was the originator. That is at the point where the sewer which I propose crosses the main sewer from Stratford (*describing*). This is the invert of my proposed sewer, which has a fall of two feet to a mile. meeting Mr. Rawlinson's sewer which is just below Ordnance datum, and therefore more than 12 feet below Trinity datum.

5610. Through the lower part you propose, as I understand you, to put your sewers at such a level as to intercept the sewage of West Ham?—Yes, and then to come on, first by an inclination of two feet to a mile, then by an inclination of three feet, and rising to five, up to a point which I considered was at that time the highest point to which the low-level system of drainage, that is, the lifting system, would apply.

5611. As far as the sewers extend, they would not at all affect the question of the East London water supply?—They would not affect it in any way except this, that in a bill which I believe the East London Water Company have now before Parliament, they propose to extend their reservoirs at the Copper mills, and the sewer that I propose would pass under the intended reservoirs though outside the existing ones.

5612. As far as keeping out sewage from the river Lee, your scheme as you have explained it, would not at all improve the condition of the East London Company's water?—No; they have an intercepting sewer there (*pointing to the section*), and the reservoirs are fed from the water above the point to which the low-level system would apply.

5613. The water is taken from a higher point than the highest of your low-level sewers?—Exactly so, but the district that I would include in those works extends as high as Waltham Abbey, with a view to dovetail into the system the intercepting sewers from those higher grounds marked on the map, the intention being to apply that sewage for irrigation, or for any other mode of purification that might be deemed best, and to allow the overflow from those works of purification to return into the Lee; but in no case would the discharge of the sewage water into the river be above the point of abstraction by the East London Company or the New River Company. I assume that under any circumstances that would be prevented, or rather that the water companies will extend their works upwards to the point where the sewage is radically intercepted. I have prepared a statement of figures showing the cost of the proposed works, and I am prepared to give them to the Commissioners if they think it desirable. The point of discharge would be at the same point as the North London main drainage, and I have provided in my estimate for making a reservoir at Barking creek to hold one million and a half of cubic feet, upon the assumption that 8,000 cubic feet would be brought down if the low-level system were made to this point (*pointing to the plan*) and that it would be there lifted.

5614. (*Chairman.*) What would become ultimately of the whole of the waters brought down there by that system?—My idea was, that the Metropolitan Board of Works might possibly take the sewage into their system of reservoirs with a view to the sewage being carried on for utilization beyond, but failing that, I proposed, as I have just now said, to have an independent reservoir, and that it should conform to the same arrangement as the works of the Metropolitan Board.

5615. With regard to the times of discharge?—Yes, and whatever was done with the sewage.

5616. (*Mr. Harrison.*) If they were obliged to carry it on to the land, you would do the same, and if they discharged it into the river you would do so also?—Yes, with this advantage; that the sewage from the district I propose to form by an amalgamation of the parishes up the valley of the Lee would not be so impure as the sewage of the metropolis; that is, there would be more water in it.

5617 Are you aware that the Thames Conservators have a bill before Parliament this year to obtain similar powers below Staines that Parliament gave them last year, to prevent any sewage being thrown into the river?—I was very glad to see the notice of that bill, but I do not know whether to read it as extending to the river Lee; if so, all the large tributaries of the Thames will be under the conservancy of the present board. I can hardly fancy that they would stop us at Barking creek when there does not appear to be any other way open of discharging it. It must be a very great improvement to discharge it there than where the Stratford sewage is at present discharged, near the mouth of the river Lee.

5618. By this system you would do good thus far, that you would divert all the sewage from near Waltham Abbey downwards on each side of the river Lee, and discharge it at Barking creek, or pump it for irrigation lower down in Essex?—Exactly so.

5619. You would relieve the Lee from all the pollution of the district?—I have divided this plan of mine into three parts, the first being that which must be lifted, and which I call the low-level system, and which is represented by the darker colour on the map; the next is the part from the uppermost margin of the low-level district up to Waltham Abbey; or it may be continued to Feilde's weir, of which the drainage on each side may be intercepted, and after being purified by irrigation or otherwise discharged into the river. But I have assumed that water will not be taken out of the river between those two points for domestic purposes, but above the highest point, Feilde's weir.

5620. Is your scheme one embracing the whole of the valley, or is it merely confined to the lower part?—The scheme that I laid before, or desired to lay before the united parishes for adoption, extended from Barking creek to Waltham, but that consisted, as I hope I have explained in the paper, of two characters of work; the low-level system into which all the sewage must go, and the medium system where the higher land sewage would be intercepted and applied in irrigation, if irrigation should be deemed the best.

5621. You do not propose to deal at all with the towns of Luton, Hertford, Ware, and Hoddesdon?—I have in view the continuation of that plan as I think I have stated in that paper, as far as a united system would facilitate the utilization of the river water for domestic purposes. The third part of my plan was this, to intercept the sewage from Feilde's weir to Hertford, and even to Hatfield on the one side, and to Bishop Stortford on the other, and having intercepted the sewage perfectly bya system of intercepting drains to discharge that sew- age below Feilde's weir.

5622. On to the land?—Yes; for irrigation, or it should be used on its way from Bishop Stortford to Feilde's weir, to run the effluent water into the river in its clarified condition, but below the point of abstraction for domestic use.

5623. Will your scheme appear before Parliament of that general character that you represented just now?—Not so; one of my great motives for desiring to give evidence before this Commission was to show that if that scheme of low-level drainage in connexion with an intercepting system, and the application of the sewage to irrigation is carried out from Barking creek to Waltham it may be continued to Bishop Stortford and Hatfield by an extension of works of a similar character whereby the water of the Lee may be utilized to a very large extent, more than it is at present. I

see Mr. Beardmore present, and I am not at all sorry to promulgate my views in his presence. I consider that a system of interception might be carried out from Feilde's weir upwards by the fork, that is, to Bishop Stortford on the one side and to Hertford and beyond on the other, and that reservoirs or a reservoir might be constructed of very large dimensions below Feilde's weir. I consider that the section which you no doubt are familiar with, the section that was printed of the river Lee, called a profile of the Lee, shows that this can be done very clearly. I consider that a reservoir might be made of large dimensions below Feilde's weir, and the water conducted from above the weir into this reservoir. I do not look to that reservoir as the only means of storage for the Lee, because I am well aware that there are many places in the tributaries of the Lee where reservoirs may be constructed. I know intimately what was proposed by Mr. Rendel in 1849–50 ; I saw great objections to several of his reservoirs when I was consulted on the subject, and when I propose supplemental reservoirs higher than Feilde's weir I am not proposing exactly those which Mr. Rendel proposed. There were some, I have reason to know of those which he did propose, which might be still adopted, while others might take the place of those that were objectionable.

5624. Below Feilde's weir do you get on to the London clay ?—You get upon a drift of the London clay.

5625. Is your objection to reservoirs above in consequence of their being in the chalk formation ?—It was proposed to raise the water in the valleys to a height above the margin of the clay, that is, to where the chalk was exposed, so that the water would be absorbed by the chalk, and of course drop down to the subterranean level of the water in the chalk—that was my objection at that time. The cost of the system of drainage as proposed up to Waltham, including the main sewer and its two branches, a reservoir at Barking creek, engines, and a pumping station, would be 252,000*l.*

5626. Did that include the main sewers ?—Yes ; and the reservoir, which was a costly item.

5627. No tributaries whatever ?—None whatever, but the whole drainage is so laid out as to intercept all the tributaries now existing, or which might exist in the subordinate drainage of places on either side, such as Tottenham, Edmonton, and part of Hornsey.

5628. You would divide the area of the Lee into three sections, utilize the upper part as the gathering ground for the rainfall, and the streams for carrying the water to a certain point; you would form intercepting sewers to Bishop Stortford, to Ware, Hertford, and other towns, and carry the sewage from them to below Feilde's weir ; there you would utilize the sewage upon the land, and after irrigation pass it into the navigation below the point from which the water companies would draw their water ?—Yes.

5629. At the lower part, not being able to irrigate you would carry it in the low-level sewer to Barking creek, and there dispose of it in the same way as the Metropolitan Board would do ?—Yes.

5630. Do you know the valley sufficiently well to say whether there is land in the district between Tottenham and Feilde's weir that would be suitable and sufficient for irrigation ?—It is impossible I think to find a better site for irrigation than is to be found in the valley of the Lee, with this reservation, that there will always be amongst the residents on the sides of the valley objectors to any irrigation; but viewing the suburbs, and having due regard to the character of them, I believe that no place will be found where irrigation could be carried out less objectionably. With regard to the soil, I cannot call it a stiff clay, but it is a stiff loam, and it would require to be under-drained, both for the sake of purifying the sewage as well as benefitting the land when irrigated. There is every capability of doing it, owing to the rapid fall of the river itself when you get above Enfield marsh. The river, I think falls something like 5 feet in a mile, or between four or five, so that the drain has only to be carried a little more than a mile to discharge the water of drainage after the sewage has passed through the soil.

5631. (*Chairman.*) Have you any idea what area of marsh land there is to be found in the valley of the Lee and its tributaries above Stratford ?—I have not calculated that.

5632. You know that there are many thousands of acres of land now comparatively useless because it is water logged ?—It commands a good rent as it is, but it might command, if it were irrigated and drained, a very much larger rent.

5633. Does it command as much as 1*l.* per acre ?—It now lets, I should think, at someting like 50*s.* or 3*l.* an acre.

5634. (*Mr. Harrison.*) Looking at it apart from the value it has from its nearness to London, and looking at the intrinsic value of the land, is there not a large area in the valley which is capable of very great improvement ?—Very great subordinate improvement, were it provided with a sufficient outfall.

5635. An outfall of this kind would be the most efficient way of obtaining the improvement it requires, that is good drainage ?—There is no doubt that up to a certain point, say Enfield marsh, there is no other means of draining the land—I speak of from Barking creek to the lower end of Enfield marsh—but with a system of low-level lifting drainage. Above that you may drain the land by ordinary land drainage, and I believe that there is every capability of applying the sewage to irrigation.

5636. Do you not believe, looking at the Lee as a whole, that there should be a scheme proposed embracing all those points to be carried out as a whole throughout the river Lee rather than any partial work ?—My notion is decidedly what you express, and I only proposed a part rather than the whole because I considered that if we had the large figures that would be involved in so large a work it would not be entertained at all, and, therefore, my idea was at the time to limit the work to Waltham Abbey, but that what was done in such a way should be conformable to a more extended scheme hereafter. I would add, that in the plan that I proposed, which extended up to Waltham, I added to the works which I have already stated would cost 252,000*l.* intercepting sewers from the higher ground to lead the sewage to the lands which I propose to irrigate, and a further system of subordinate outfalls by which the irrigated lands would be drained into the river at a lower point, so as not to carry the water into the sewers, and the cost of that work would be 52,500*l.*, to which I added for the expense of lands and easements 20,000*l.*, making the total cost of the low-level system, in connexion with the interception of the high land sewage as far as Waltham, 324,500*l.*

5637. (*Chairman.*) Have you at all considered the rateable value of the property to be dealt with, and the rate in the pound per annum that it would take to pay the interest upon that money ?—I have calculated it, and I have stated it in the paper before you.

5638. With a view to getting rid of that burden would you prefer to pay it in 30 or 40 or 50 years ?—I recommended, particularly in this report, that it should be extended to 50 years.

5639. Would you propose to borrow a loan from the Exchequer Loan Commissioners at a low rate of interest ?—That was part of the scheme ; and the reason why I stated 50 years was, that the works were designed for prospective benefit rather than an immediate one, and, therefore, it was only just that the term should be lengthened one.

5640. (*Mr. Harrison.*) So as to let the property as it became improved pay for the improvement which had increased its value ?—Just so.

5641. (*Chairman.*) Have you entered into any question of profit and loss, taking the value of the lands to be dealt with now, and taking the probable improved value after dealing with them, and after the expenditure of the sum of money you have named ?—No. I looked upon the outfall as essential, not for the drainage

LONDON.

B. Denton, Esq.

4 Feb. 1867.

of the land, but for the sewerage of the inhabited portion.

5642. Therefore it would be a matter the cost of which you could reasonably call upon the towns to meet, because they are now polluting the whole area by their sewage, and those works would enable them to sewer more completely, and not to commit an injury upon their neighbours?—Just so, and for another reason, that any improvement of land would not involve objectionable water, any discharge from the land being, under the present circumstances, a great improvement to the sewage discharged from the inhabited portions, there would be no objection to its being discharged into the river.

5643. (*Mr. Harrison.*) Are you going to appear before Parliament with a scheme in connexion with Tottenham and other towns?—At the present moment we are at a standstill; plans were prepared for deposit and they were deposited. Notices were given, and the parishes had a meeting at which they determined to do nothing, but consider it further on the ground that if through any report emanating from this Commission, or from compulsion, they were bound to combine in the general outfall, that Parliament would suspend the standing orders, and give them the power of doing so. Therefore, the result of the meeting of the parishes was to suspend our proceedings, and the consequence has been that the original scheme for the Ham marshes has been sunk in the indifference of the parishes to their present emergency.

5644. (*Chairman.*) We may assume that this inquiry has rather retarded than facilitated your operations so far?—It is so.

5645. (*Mr. Harrison.*) I suppose the result of our inquiry, if it ended in a more general scheme, would be beneficial?—It would exactly fit my notion of what ought to be done. I should mention, passing from the low-level drainage to the highest part of the district, that in my practice I have had to deal with two or three works which bear very closely upon the question before us, for instance, I have just finished the drainage of an estate immediately above Luton; it is but a small quantity of land, but there is a very large and constant discharge of water. The works have been in my hands something like 18 months, and I can speak with some certainty as to the large quantity of water that has been discharged from those lands. They are the property of Mr. Crawley, and the works consist of a system of under-drainage running up the valley here (*pointing to the plan*). The quantity of water delivered at that point I believe would go a great way towards supplying the whole of the town of Luton. I cannot state it positively, because I have never measured it; but I consider there is half a million of gallons discharged daily from that drainage area alone. I believe that the people of Luton are now considering some mode of pumping the water from the chalk, and the difference between that proposal and the utilization of Mr. Crawley's water would be, as we have seen in the Thames, that the pumping would draw the surface water down into the ground to be pumped up again.

5646. (*Chairman.*) Suppose you had to deal with the sewage of Luton, seeing that you have a choice of going up or down, the land being equally favourable both above and below, should you go up or down?—In the case of Luton I believe you have an exception to that which I consider the best plan generally, which is to go down and to discharge by gravitation. Here is an exceptional case, the ground round Luton is of an absorbent character, and would be very grateful for the sewage that might be spread over it; and the height of the hills is such that when the sewage penetrated them and found its level down into the soil, the water that could pass through the soil would return to the river in a pure state. I mean chemically pure as well as clarified.

5647. You think that there are exceptional circumstances at Luton that would induce you to irrigate the upper part of it rather than the lower?—Decidedly. Luton is surrounded by high lands of various characters, there is chalk, sand, and clay, and whatever sewage was pumped above Luton would, from the physical state of the country, pass into the soil and find its way ultimately into the springs without any injury to the river itself.

5648. If you could get an area of land sufficient to absorb all the sewage that you had, a couple of miles below, to which it could be conveyed by gravitation, might not that be cheaper than pumping it to the land above?—Yes, cheaper; but of course it would be disadvantageous to use that water after irrigation for domestic purposes. I have taken some pains, speaking only as one of the multitude interested in the question, to discover whether water, after passing through land or over land by irrigation, enters the river in a condition fit to drink, and the result of all the attention I have bestowed upon the point has been, that it is not fit to drink. Now, I do think, that Luton, standing at the head of the Lee system, might be compelled to pump its sewage to a height that should result in the passage of that sewage through a depth of soil which should lead to its discharge in a chemically pure condition into the river.

5649. Do you know what they do at Luton with their sewage now?—I do not.

5650. You do not know what it costs them to deal with it?—No.

5651. Do you know what the sewage consists of at Luton?—No, not precisely.

5652. You are not aware that there are tons of oxalic acid which go into the river every year after being used in bleaching the straw, and many tons of acids of different kinds, and sulphur, and in fact that there are exceedingly deleterious ingredients mixed to a large extent with the sewage of Luton, and coming from the neighbourhood of Luton?—Then I consider that an additional reason why the sewerage of Luton, if it is to be utilized at all, should be utilized in such a way as that the discharge should enter the river after every possible means had been taken to purify it. I do not think that any utilization of the sewage by irrigation in the valley can lead to the result we desire, which is a chemical purification of the water.

5653. (*Mr. Harrison.*) You think that its passage through a great depth of chalk or soil would so chemically purify it as to make it unobjectionable?—I do think so; but I do not speak from sufficient knowledge to be able to affirm it without some slight doubt, but it is very slight.

5654. (*Chairman.*) At present the authorities of Luton are compelled to filter the sewage of the town, and they are doing it at an annual expense of many hundreds, by a series of sediment beds. The sewage is treated by lime, and it is allowed to stand in open shallow reservoirs until deposition takes place, then the effluent water runs away into the Lee, and the mud is wheeled away?—Can anything be worse than that, except the simple discharge of the sewage at once into the river. Passing from Luton, which I referred to, because I consider it is one of the difficulties in utilizing the upper streams of the Lee, I will just mention another case on the Stort, showing the absolute necessity for strict supervision, and the necessity for complete interception of sewage water. I was called upon by one of the Courts to inquire into the discharge of sewage from some dog-kennels belonging to the Reverend Mr. Arkwright. He was master of the Essex hounds, and his dogs were dressed with arsenic, as I believe is the custom for mange and other skin diseases. The dogs were occasionally fed with glandered meat by accident, at any rate glandered horses had found their way to those dog-kennels. This was near the Stort, some six miles above its junction with the Lee. It was found that the drippings of horse flesh when glandered, and the arsenic from the washing of the dogs, found their way into Harlow brook and poisoned the horses that drank out of the brook. The consequence was that Baroness North brought an action against Mr. Arkwright for the damage that her tenants had suffered, and particularly one Mr. Barnard, and the Court ruled that the practice should be discontinued, and I was called upon

to see whether the discontinuance was perfect. Mr. Arkwright, finding that the Court had given this order, adopted various plans of purification and filtration, and even irrigation also; Dr. Voelcker, at my instigation, accompanied me to the spot and obtained some of the water and analysed it; although perfectly clear to the eye, and so satisfactory to all appearance, that I was very nearly drinking some of it, it was found on analysis to be as chemically impure as ever. Again, to convey to you what information I possess with regard to another tributary of the Lee, viz., the Mimram, I may state that I have just devised a scheme for draining the small town of Welwyn, and there there is no mode that I can see of dealing with the sewage, except by filtration, and discharging it into the river lower down, the difficulty being that it is not a town sufficiently large to warrant any expensive works, and the consequence is that without some very rigid rules as to the interception of the sewage, and conveying it down to a distance where it could be used for irrigation, I at present see no means of carrying out that drainage satisfactorily.

5654*a*. (*Mr. Harrison.*) Can you tell us the area of the upper portion of the river Lee which you have marked above Feilde's weir?—I cannot.

5655. Do you know the population of that area?—I do not.

5656. The principal towns are Luton, Hertford, Ware, and Bishop Stortford; what others are there?—There is Hoddesdon and Harlow and Sawbridgeworth; but there would be no difficulty in intercepting the irrigated sewage from Bishop Stortford to Feilde's weir, nor from Feilde's weir to Hatfield, though it might be considered best to lift the sewage and apply it at a high level.

5657. It is your proposition that Luton and Welwyn and other towns and villages similarly situated should be obliged to pump their water on to a high level, so as to purify it before it passes into the Lee?—I mentioned Luton as being a town where some special mode of arrangement should be adopted; as to Welwyn, I mentioned that merely as illustrating one of the many difficulties there are in dealing with these cases, but it is not an insuperable one. If a system of interception was generally carried out, that is, by combination, there would be no difficulty in dealing with it; but to deal with Welwyn without combination, certainly it would be too small, and in a very difficult position. Reverting to the question of storing water, there is no doubt whatever that if proper storage reservoirs are constructed there is no difficulty. I know I am speaking in the presence of those who appreciate it, and I do not hesitate to say, from a long acquaintance with valley drainage, and of the soil which exists in those valleys, that many places might be selected for the construction of reservoirs. I remember very well investigating the plan which was proposed by Mr. Rendel, and being struck with one reservoir which was to be made in Lord Salisbury's park, at Hatfield, I have noticed since a capability that exists in several parks to carry out what Lord Salisbury would have been glad to have seen carried out there. I refer to Pansanger, where there is a capability of storage, and to Brochet, Luton Hoo, and Welwyn Hoo, though there would be objections by some owners to drawing down the water. Again on the Rib near Wade's mill, and above Thundridge, I believe, there is a capability of constructing reservoirs, but, as I said before, they would have to be specially constructed, partly in the ground, and partly above; but not in connexion with those porous grounds which would allow of the escape of the water as fast as it got in.

5658. What was the extent of the reservoir that you proposed below Feilde's weir?—I took 610 acres as that which I considered would allow of a reservoir being made to hold a reserve of 20,000,000 gallons a day for 182 days, that is assuming the mean depth to be 22 feet.

5659. Have you gone into the probable expense of that reservoir?—No; not with sufficient accuracy to mention it; but I should tell you that looking at that, occupying 610 acres, and extending the supplemental reservoirs on the tributaries to 300 acres, and allowing 100 acres for banks and spoil, I considered that the whole would be done for half a million of money, exclusive of the cost of the covered conduit to bring the water down to the pumping stations.

5660. What volume of water have you calculated you could impound in the upper reservoirs?—Half as much more, making 30,000,000 gallons, in addition to that which is now obtained by the East London and New River Companies.

5661. Is there any other point upon which you wish to give us information?—I should certainly like to add, by way of explanation, that in the scheme which I have endeavoured to explain to you, we have made the extent of area tributary to the river Lee after irrigation, and after the water has been clarified by it, as large as possible and that of the low-level district as small as possible. I do not know whether you have observed it, but it is a very interesting feature in the consideration of this subject, that the New River expresses a tangible contour line to illustrate this division. You will find here (*pointing to the plan*) that it is 100 feet above Ordnance datum; it rises up a little, very imperceptibly, about 1 in 10,000, and you cut off that land (*pointing to the plan*) which can be made subservient to an irrigating system. I just observe upon that ot show the extent of land which might be made tributary to a system of irrigation on the Lee; of course it would extend lower than the New River as it approaches nearer to the place of distribution; but that line (*pointing to the plan*) conveys to the mind a very clear line of demarcation. Again, let me observe, as to a point upon which perhaps I was not explicit enough that with regard to the intercepting drains which I should propose as a means of keeping the river above Feilde's weir pure enough to drink, they would be open drains. I should not propose any covered drains where irrigation clarified the sewage, or else the expense would be very greatly increased.

5662. Would you take the sewage of Hertford, Ware, Hoddesdon, and the sewage of Stortford down the valley of the Stort in an open drain?—In open cuts after irrigation.

5663. You propose to take the sewage of Hertford, Ware, and Bishop Stortford and other towns to this mid-area, and there apply it?—Yes.

5664. Then until it arrived at Feilde's weir, you would carry it, in a close sewer?—No. I have not explained myself upon that point. I am assuming that the sewage of those various towns and villages would be applied for irrigation as it passed on its way towards Feilde's weir; if it were not purified by any system of irrigation, I am not prepared to say but that a covered conduit would be better than an open one.

5665. You would apply the sewage of Hertford, Ware, Bishop Stortford, and all the villages and towns on the river Lee and its tributaries, to land in the most convenient places adjoining to those towns; but you would intercept the effluent water from the irrigated fields, and carry it down in open ditches to below Feilde's weir?—That is precisely what I meant.

5666. Where it might be applied to the land, or be passed into the navigation?—That is the plan. If there were places where the sewage could not be used for irrigation, I cannot say at this moment that it would be better to convey it by a covered channel than an open one. The object would be to keep the cost of the works as low as possible.

5667. Is there any other point that you wish to mention?—Mr. Rogers Field, who is here, has taken some pains in getting out details, but perhaps they will be surplusage at this moment; he is perfectly willing and able to answer any question as to the way in which the quantity of sewage that we propose to discharge at Barking creek has been arrived at, and the details of the cost, if you wish to examine him upon it.

The witness withdrew.

LONDON.

B. Denton, Esq.

4 Feb. 1867.

The witness subsequently forwarded to the Commission the following letter:

22, Whitehall Place, London, S.W.,
April 16th, 1867.

GENTLEMEN,

MR. BAZALGETTE has addressed a report to a committee of several parishes on the river Lee in which he says that the sewage of the whole valley, including East and West Ham and Leytonstone, as shown by colour on a map appended to his report "can be conveyed by "gravitation to Barking," and that "no portion" of the district between Hertford and Stratford is suited for irrigation by sewage.

As this is in direct contradiction to the evidence given before your Commission on the 4th February last by Mr. Field and myself, I am desirous of an opportunity of placing before you, if it be not too late, proofs of the accuracy of the statement then made, and of the plan and section submitted to you upon which was based a proposal to form a drainage district of the whole valley, to comprehend a low level in conjunction with a high level system of works and lifting of a portion of the sewage.

You will observe in Mr. Bazalgette's report, that he proposes to remove the whole of the sewer of the Lee Valley to Barking Creek, there to be either utilised by the Essex Reclamation Company or discharged into the Thames, by both of which modes of disposal the water containing the sewage will be lost to the navigation and mills of the Lee.

It is unnecessary for me to remind you that, if the benefits of irrigation shall turn out to be greater than the cost of lifting, the sewage will be readily utilized by agriculturists on the high grounds within the Lee watershed with the twofold advantage of fertilizing the district from which it is derived, while helping to maintain the river system by the return of the effluent water after utilization. I think too it is equally unnecessary to point out to you that there are many reaches of low land on the sides of the Lee to which sewage may be applied with advantage by gravitation, owing to the rapid fall of the river (see section) which will afford a ready means of underdraining the lands to which the sewage may be applied. By removing the sewage of the Lee valley to Barking Creek on the other hand, and delivering it over to the Essex Reclamation Company for application, no part of that sewage can be applied to land without lifting, mixed as it will be with the sewage from Tottenham which can only be discharged at a lower level than the surface of the land.

Should your Commission be unable to hear me in further explanation of the data upon which my evidence was based owing to the time that has elapsed since I gave it, I have to beg you will allow this letter to appear in the appendix of your report as a reiteration of the following conclusions:—First, that it is utterly impossible to form a district of the whole of the Lee valley, the drainage of which shall be discharged by gravitation at all times of tide; next, that the sewage of Tottenham itself cannot be wholly discharged above high tide without recourse to mechanical agency; and last, that there are special capabilities in the upper part of the Lee basin for the utilization of the sewage of the different towns discharging into the river profitably and without objection, if the river be placed under a proper conservancy, having due regard to drainage, water supply, navigation, and mill power.

I have, &c.,
(Signed) J. BAILEY DENTON.

To the Rivers Commissioners.

Mr. R. Field, C.E.

Mr. ROGERS FIELD, C.E., examined.

5668. (*Mr. Harrison.*) You have been engaged with Mr. Bailey Denton in devising this scheme of interception?—I have.

5669. Have you entered to a considerable extent into the particulars of that scheme?—I have.

5670. I see that one of the main drains on the fork passes the towns of Tottenham, Edmonton, Enfield, and other places?—Yes, at least provision is made in the scheme for the drainage of all these towns.

5671. Are you aware of the difficulties that those towns lie under at present, as to carrying out a complete system of sewerage?—I am.

5672. Are you aware that Tottenham is, at present, lying under an injunction not to extend its sewerage system, which it proposed to do; and Barnet, which is an extensive parish, has been discharging its sewage into a cut that was made by the East London Water Company?—Yes.

5673. An injunction has been obtained to prevent the authorities of Barnet from discharging any more sewage into that cut?—Yes, I am aware of that.

5674. Would this scheme that Mr. Bailey Denton has devised and explained to the Commissioners get over the difficulty in the case of Tottenham?—Entirely.

5675. Are the sewers sufficient to carry off the sewage from the extensive districts to the west of the Lee, in case it becomes covered with a dense population, such as appears to be growing rapidly upon it?—The sewers shown on the plan are calculated with reference to the population merely of the district that is distinguished here (*pointing to the plan*) as being the low-level; the sewage of the high-level district is intended to be utilized for irrigation, and the effluent water discharged by gravitation into the river Lee or navigation. I may explain, in reference to the principle upon which the sizes of the sewers were determined, that the population according to the census of 1861, of the low-level district extending from Enfield to Barking creek, may be taken at 68,000, and the present population will be about 94,000; the area is 26½ square miles.

5676. If that was built upon, and so densely populated as the parts now occupied by the poorer classes of London, what would be the population upon it?—We have allowed for a different density of population in different portions of the district; for instance, the first portion, consisting principally of East and West Ham parishes, contains an area of 10¾ square miles, with a population in 1861 of 41,000, and I have considered it might have eventually a population of 200,000. Going upwards, I consider the district would not be populated to anything like the same extent, and I have therefore taken about three times the population of 1861.

5677. Why should the district not be largely populated?—Because it is getting further away from London, and judging by the rate of increase that has already taken place in West Ham, the population has doubled itself in 10 years, in the parishes above it has only increased from 20 to 45 per cent. in 10 years.

5678. The lower part is nearer to the river and Victoria docks?—Yes; in calculating for the other portions I have allowed about three times the population of 1861, amounting in the gross to 280,000 for the entire low-level district, the present population being 94,000 on an area containing 26½ square miles.

5679. Have you any facts as to the area of land in the valley of the Lee which is applicable for irrigation? The intermediate district you calculate can be brought in and the sewage applied to the land; the population is an item of importance, and also the area of land to which the sewage could be applied?—The present population of the high-level district up to Waltham may be taken at 55,000.

5680. What is the prospective increase that you expect?—That point has not been gone into further than to ascertain that there were capabilities for irrigation for any probable increase of population. There is a long and wide tract of level land here (*pointing to the plan*) which would be available for irrigation. It is considered that it would not be advisable to irrigate below the point B at the upper end of Tottenham marsh; but there is a considerable extent of land from B to C, near Broxbourne, which might be available, and would give an ample area for irrigation, several thousand acres.

5681. Would that land be so close to dwellings, towns, and villages as to be a nuisance?—An ample area, I think, would be found here (*pointing to the plan*) that would be sufficiently distant from the villages, so that irrigation would be perfectly feasible; the populated parts are not nearer to the river than a mile.

5682. Are there any other points that you wish specially to explain?—I may explain as to the principle on which the works were designed, that it was considered advisable to make the sewers of sufficient capacity for the maximum volume that they

would eventually have to take, but that the engine and reservoir need at present only be constructed of a small size with reference to the population for the next 8 or 10 years, as they could be enlarged when required. The estimate therefore includes sewers calculated for the maximum population stated, and reservoirs and engines only for half the maximum population.

5683. (*Chairman.*) Do you remember what your engine power is to be?—The full engine power that would be required would be 370-horse, and we propose to provide, 200-horse power for the present.

5684. What would be the lift?—It would vary from 12½ to 30 feet; when the sewers were running full the lift would not exceed 24 feet, and the maximum power required is calculated for this lift.

5685. What volume of sewage would you have to lift for 24 hours, or for an hour?—The maximum flow, including rain, that would have to be lifted ultimately would be 8,000 cubic feet a minute, half of this, or 4,000 cubic feet per minute, is what we have provided for in the first instance.

5686. (*Mr. Harrison.*) This scheme is one just beyond the limits of the metropolitan district, and devised to carry out a general system of intercepting sewerage for the whole of the suburban districts of the metropolis that now drain into the Lee, and to which the system of irrigation cannot be applied?—Precisely. The low-level district has been confined strictly to those portions from which it was considered impracticable to utilize the sewage by means of irrigation. Of course the precise limits of this district could only be defined by an accurate survey, but they have been arrived at approximately for the purposes of calculation. I think another point on which you wished for information was the rateable value of the district. This is a little over 600,000*l.* for the entire district below Waltham, including both high and low level.

5687. What was the rateable value of all the lower portion?—I have not got that separately.

5688. Is this lower limit (*pointing to the plan*) the portion which you intend to rate for the execution of the works.

(*Mr. Bailey Denton.*) No, it extends to the whole of the tributary area from Waltham to Barking creek; for instance, we should bring in Hornsey, which lies immediately about the New River, which I have spoken of as giving a contour line, dividing that part of the district of which the sewage could be utilized from that which must go to the low level for discharge.

The witness withdrew.

Adjourned *sine die*.

Lee Valley and Ham Marshes Sewage.

Memorandum as to Data on which the Project is based.

The valley of the Lee from the Thames to Waltham Abbey was proposed to be divided into two districts, a Low-level District and a High-level District. The sewage from the Low-level District would be intercepted by a deep main sewer and branches which would convey the whole of the sewage of the district to Barking Creek, where it would be raised by steam power into a covered reservoir similar to the present one of the metropolitan Board of Works, thence to be discharged into the Thames, or dealt with in any other way in which the metropolitan sewage may eventually be treated. The sewage from the High-level District on the other hand would be used for irrigation, and for this purpose would be intercepted by a series of main sewers and conveyed to various points on the meadows adjoining the Lee, the effluent water being discharged by gravitation into the river or navigation.

The following observations refer only to the Low-level District:—

Area and Population of Low-level District.

Names of Parishes.	Area within District.	Approximate Population within District.		Increase per cent.	Approximate present Population.	Prospective Population provided for.
		1851.	1861.			
	Square Miles.

Total - -	26½	40,567	67,896	—	94,000	280,000

Sewage provided for.

The volume of sewage is taken at five cubic feet per head per diem, and it is assumed that half this amount will flow off in six hours, giving a maximum flow of double the average daily flow.

Rain provided for.

The amount of rain provided for varies with the nature of the districts. In the Stratford and Ham Districts, which are for the most part below the level of high water, provision is made in the sewers for a quarter of an inch of rain *flowing off the ground* in the 24 hours, and it is assumed that the whole of the area capable of being built upon will be populated. In the districts above Stratford it is assumed that the rainfall will, to a considerable extent, be discharged into the river by the natural channels, independently of the sewers, and that storm overflows will be constructed in connexion with the sewers, so that only one eighth of an inch of rainflow per diem is provided for, and a deduction is made from the whole area for the portions it is considered will not be populated.

The table on p. 192. gives the details of the prospective population, sewage, and rainflow provided for in the different districts, and the calculated diameter of circular sewers capable when running full of discharging such sewage and rainflow. The sewers provided for in the estimate are somewhat larger than the sizes given by calculation, and an allowance is made for their being, where desirable, egg-shaped instead of circular. There would of course be intermediate changes of dimension between the points specified in the table, so as to graduate the sewers to the work they have to perform.

Engine Power required.

The maximum prospective sewage and rainflow is 7,941, or say 8,000 cubic feet per minute. The lift will vary from 12½ to 30 feet, but the maximum lift will not occur at times of maximum flow, when the main sewer is running full, which it will be at times of maximum flow; the lift (to the top water of the reservoir) will not exceed 24 feet. The engines must therefore eventually be capable of raising 8,000 cubic feet per minute, 24 feet high, or an aggregate power will be required of (say) 370 HP. It is proposed in the first instance to provide 200 HP.

Reservoir.

Assuming that the reservoir must be capable of holding six hours maximum flow of sewage and rainfall (which exceeds the provision made in the metropolitan reservoirs), a capacity will eventually be required of 2,880,000, or say 3,000,000 cubic feet. It is proposed in the first instance to provide a reservoir of one-half this capacity, or 1,500,000 cubic feet.

(Signed) Rogers Field,
6, Cannon Row, Westminster,
March 15th 1867.

INDEX.

[*Numbers* 3236–3336 *are repeated in the Evidence: when in the Index the reference is made to the numbers as used the second time, the numbers are distinguished by an asterisk.*]

A.

Armstrong, Mr. (of Hertford):
Evidence of, 4176–249.

Ash:
A tributary of the Lee; has a steep fall, and diminishes in volume rapidly in time of drought; considerable quantity of clay in valley, 816.

Ashes:
Not a ton thrown into Lee in course of a month, 763, 3581–5; at Mile End are sold for 550*l.* annually, whereas if mixed with nightsoil they would cost 2,000*l.* to remove 3307–13.

B.

Bailey, Mr. (of Luton):
Evidence of, 1601–43.

Barnard, Mr. (of Stortford):
Evidence of, 2447–545.

Barnet, Chipping:
See evidence of Surveyor to Local Board, Mr. Cakebread, 3950–73. Population, 3,000 in number, 3953. Under Local Government Act, 3952. Sewerage: none; cesspools usual; sewage liquid finds its way by various ditches into East Barnet Brook, and so into Lee, 3957–69. Water Supply: none public; private pumps; hill full of water, 3960–1.

Barnet, East:
See evidence of Mr. Baxter, 3974–4015. Population, 900, 3975. No local government, 3974. Cesspools usual, 3976. Sewage passes by ditches to intercepting drain in Angel Lane, and thence into Lee, 3979. Estate of British Land Company, with 500 houses, properly sewered; sewage from four sewers is strained of its solids and then poured into brook, 3985, 4001–3; contents of fifth sewer, being sewage of 50 houses and 200 inhabitants, passed into a cesspit in green sand, 3987–90, 4008–15. Sewage Irrigation; land generally residential and valuable, 3991–3, 4004–7.

Bates, Mr. (Secretary to East London Waterworks Company):
Evidence of, 1–65.

Baxter, Mr. (of East Barnet):
Evidence of, 3974–4015.

Beardmore, Mr. (Engineer to the River Lee Trust):
Evidence of, 659–915.

Bed:
Of river above navigation silted up, 4928–34.

Bishop Stortford. See *Stortford.*

Bleaching of Straw Plait:
Materials used: oxalic acid, salts of tartar, salts of sorrel, pearlash, brimstone, 1677, 1722–3, 1996–2000. Amount of materials used by one firm, 1724–32. Out of 1,000 gallons of water, perhaps 300 used for bleaching, 1739–40. Refuse valueless, 1741; passed away a dark brown liquid, thick with refuse soap and soda, into sewers, and so into river, 1733–5; most poisonous, **1752–4.**

Bond, Mr. (of Ware):
Evidence of, 5486–536.

Brewery:
Refuse from, passes into Stort, 2506–11.

Brown, Mr. (of Ware):
Evidence of, 5537–55.

Busk, Mr. (of Edmonton):
Evidence of, 3710–94.

Butcher, Mr. (of Ware):
Evidence of, 5185–239.

C.

Cakebread, Mr. (of Barnet):
Evidence of, 3950–73.

Cesspits. See *Barnet, Luton, Stortford, Tottenham, Ware.*

Cheshunt:
Population 6,592 in number, 523; increasing fast, 655.

Cobham, Mr. (of Ware):
Evidence of, 5002–184.

Colney Hatch Asylum:
2,000 lunatics and 400 attendants, 3718–21. Sewage from, ground of litigation to Edmonton Parish, 3717, 3738–40. Sewage irrigation tried on a very small scale, and found expensive, 3722–34. Land difficult to be had, 3787. Water supply from well, 3772.

Conservancy:
Necessity of, entire valley in an unsatisfactory state, 5420. Litigation constant, and a hardship, 897; and see *Litigation.*
Duties of, to prevent pollution of streams, 103, 434, 767–71, **3332*–5*, 3540–3,** 3754–6. To provide for arterial drainage of valley, 782, 886, 2527–8, 2612–16, 4941, 5421–29. Powers of Thames Conservancy Bill of 1866 might be followed, 447–51. Powers must extend over whole of Lee Basin, 3334*, 3769–70.
Proposed constitution of. 1. Not Lee Trustees, but a new body comprising representatives of all interests, navigation, both Water Companies, Metropolitan Board of Works, Essex Commissioners of Sewers, parishes, traders, &c., 458, 462–4, 471, 565–70, 5419, 5430. Lee trust does not comprise a sufficient element of business men, 4866–9, 5459–68; and there is no appeal, 4871. 2. *Secus,* Lee Trustees fitted to be conservators; satisfactorily represent local interests, 5441; are qualified to do the duty, 4551–3, 4573–8, 5482–3. After first outlay upon works between Tottenham and Stratford a small working staff would be sufficient, 897, 905. Bill of 1850 proposed to give to Lee Trustees powers and duties of conservators, **4591** [Paper.] Lee Trustees would object to a conservancy independent of their own body, 4582, 4602, 4649. 3. Lee Trustees might elect a small body to be conservators, 5469–70; or an appeal might be allowed from them to some Government department, 4560, 4871; but undesirable to add Government nominees on the trust, 4561–7. Lee Trustees ought not to be a drainage commission above Hertford, 882–3.
Proposed payment of expenses of, a tax on towns, water companies, and benefited area; area benefited easily definable, 898–901, 5433. The water companies would willingly contribute, 449–51, 1321–7. Tax to be levied not by Lee Trustees but by local authorities, 902–4. Conservators themselves should be unpaid, 5472–6.

Cumberland, Mr. (of Luton):
Evidence of, 1807–69.

D.

Davis, Mr. (of Luton):
Evidence of, 2021–46.

Davis, Mr. (of Stortford):
Evidence of, 2767–889.

Delano, Mr. (of Tottenham):
4119–40.

Denton, Mr. Bailey:
Evidence of, 5571–667.

Drainage, Land, (effect of):
To diminish flow, 2531–45; to increase flood in case of prolonged rainfall, 5585–92; not much required for subsoil of upper end of Lee Valley, 795–7; *secus,* much land waterlogged at lower end of valley, 782–91. In Stort Valley, 2278–83. Arterial Drainage required, 782, 886, 2527–8, 2612–6, 4941, 4521–9, and see *Flooding.*

[*Numbers* 3236–3336 *are repeated in the Evidence: when in the Index the reference is made to the numbers as used the second time, the numbers are distinguished by an asterisk.*]

Dredging:
Done systematically by Lee Trustees, 753; more and more required in lower parts from influx of sewage, 751–3. In upper part ballast sold, 777*a*, 4747–8.

Dyeing: Of Straw Plait at Luton.
Materials used: logwood, sulphate of iron, cuba fustic, yellow wood, camwood, Brazil wood, indigo, sulphate of indigo, sulphate of copper, shumach and madder, 1677, 1974–90. Amount of materials used by one firm, 1976. Wood dyes used in chipped form and solid refuse burnt, 1975–82; liquid refuse amounting to three-fourths of total volume of water used is passed into drains and thence into river, 2006–7. Much dyeing carried on at private houses, 1755–6.

E.

East London Waterworks Company:
Witnesses examined:
Secretary to the company, Mr. Bates, 1–65.
Engineer ,, Mr. Greaves, 66–658.

I. Constitution.
II. Right to abstract water of Lee.
III. Point of intake.
IV. Pollution of river above intake.
V. Treatment of water.
VI. Quantity and quality of water.
VII. Distribution.
VIII. Miscellaneous particulars.
IX. Supply during outbreak of cholera in 1866.

I. Constitution:
Acts of Parliament prescribing, 532–3 [Paper], Paragraphs, 7–15; 534. Capital, 4–7: dividend 6 per cent. on stock, 4½ on shares, 9; annual dividend limited to 10 per cent. except to make up arrears, 17–18.

II. Right to abstract water of Lee:
Fixed by Act of 1855 (18 & 19 Vict. c. 196, Sec. 11, 27, 30). Lee trustees entitled to a fixed volume for use of navigation; the two water companies entitled to residue (as far as Tottenham) in certain priorities, 4501–2 [Appendix No. 1].

III. Point of intake:
Originally in 1807 the tidal water in Old Ford; after 1825 Lee bridge, 35; since 1852, a point a little higher called Higham Hill, the parallel of Stonebridge lock between 3 and 4 miles below Enfield, 73–5: the point is a long way above tidal influence, and separated by two locks and mill falls, 964; the point is not in navigation but in old river, which diverges from navigation several miles higher up, near to Ponders End, 823–4.

IV. Pollution of river above intake:
(1.) By sewage from Luton, Hatfield, Hertford, Ware, Hoddesdon, Broxbourne, Cheshunt, Waltham Abbey, Waltham Cross, and Enfield highway on the Lee; from Welwyn and Whitwell on the Mimram; from Stortford and Sawbridgeworth on Stort. See *Pollution*. Not by sewage of towns on Lee between Ponders End and point of abstraction, which is intercepted by Catchwater Dyke constructed by the company and conveyed into Lee below point of abstraction, 82–5, 3758–64.
(2.) By refuse from bleaching and dyeing of straw plait at Luton. See *Bleaching* and *Dyeing*.
(3.) By refuse from maltings at Stortford and Ware. See *Malting*.
(4.) By sheepwashings, 5332–6.
(5.) By tanyard, 5338.

V. Treatment of water:
(1.) Conduit water drawn from river to settling reservoirs by open canal 1¼ mile long with puddled sides, unformed bed, and slight fall, 107–116*a*. Canal cleaned out two or three times a year, 970–2; would not be better for being covered, 359. No screen between conduit and river, so floating refuse would enter conduit, 128–33. Bathing prevented in conduit, 134*a*–6. From conduit water is passed into reservoirs at Lee bridge.
(2.) Storage reservoirs. Five reservoirs covering 120 acres, and capable of holding 170,000,000 gallons, or about six days' supply, 548, 615–22, 628, 974–9; therefore enabling the company to dispense with taking the first flood water which is thick, 90–5, 613–34; but not with taking polluted water when river is low after a long summer drought, 529–31. Reservoirs made in 1861, and yet no great deposit, 974–9; company is applying to Parliament for power to increase reservoir room, 94–5, 218–9.
(3.) Filter-beds. After subsidence in reservoirs, water is passed through filter-beds. Filter-beds occupy 12 acres, 103*a*, 437; made of fine sand, 438, 643–50; all in use at once, 104; usually cleared once in six weeks, but that depends upon amount of turbid flood-water or of summer vegetation, 117–37, 141. Filtering process never interrupted, 990–1.
(4.) Service reservoirs &c. From filter-beds part of water pumped immediately into mains at Lee Bridge, 291–4, 395, 992; other part passes by covered conduit of cast-iron, two miles long, to covered service reservoirs at Old Ford, 362–8, 374–5, 394–5. These service reservoirs occupy 2½ acres, and are emptied daily into mains to extent of one-third, 936–8. The mains of both Lee Bridge and Old Ford works join each other promiscuously throughout area supplied by the company except as to two portions of high elevation, 381–2; but the waters of the two mains might have travelled over a long distance before mixing, 398–9. Both works must be in operation at the same time; not power enough in Lee Bridge works to serve upper elevation, nor in Old Ford works to supply whole district within the proper time, 377–8; usually for lower district night-work done at Lee Bridge; day-work at Old Ford, 384. Engine power 1,000–1,200 horse, 186; height to which water is lifted, 194.

VI. Quantity and quality of water:
Volume pumped 20,000,000 gallons daily, 193. 90,000 houses supplied, 19. Proportion of waterclosets to each house, 916–8, 658–9 [Appendix No. 1.] Quality of water, see analyses, 658–9 [Appendices No. 3 and 4.]

VII. Distribution:
Partly constant—Mains permanently charged, and from these about 1,200 large consumers, traders, &c. have a constant supply by meters, 235, 319, 322; also some poor tenants also who are found to consume from 12–15 gallons daily, 108–20. Chiefly intermittent, under fixed arrangement, generally for about 20 minutes every day, 1008–15; but no Sunday supply, 236–50. In case of small cottages, company prefer to deal with landlords, but arrangements made by landlords to receive water frequently insufficient or else wasteful, 236–50, 3217–22, 3314–35. Total supply insufficient; company could sell twice as much if they had it, 214–8; but Lee will not yield enough, 226–8. Company are applying to Parliament to draw from Thames, 219.

VIII. Miscellaneous particulars.
Water for fire-extinction supplied gratuitously, 26; usual head of water, 256–261. Hospitals and parishes supplied at half rates, 26. No incrustation in mains, 268–70; no pollution from gaspipes, 277–85; dead ends of pipes occasionally foul, 263–5; fractures in frost time rare, 271–7.

IX. Supply during outbreak of cholera in 1866.
After Act of 1852 two open reservoirs at Old Ford went into disuse, and were never regularly refilled since 1855; they nevertheless remained filled, partly by overflow from upper filter beds when choked, partly by soakage, 143–4, 177–85, 931–2; also were adjoining to tidal portion of Lee, where are exposed mudbanks exhaling foul gases, 927–8, 940–7. Communication between open reservoirs and closed reservoirs of filtered water at Old Ford possible up to autumn of 1866, 165–74; then cut off; before that, open reservoirs were very rarely drawn upon to supplement covered reservoirs of Old Ford; this done in 1864 with no bad effect, 557–9. In 1866, just before outbreak of cholera, a small quantity thus taken from open reservoirs, 145–64, 556; and thus the district in which cholera raged was during the day supplied from Old Ford covered reservoirs, which contained some water from open reservoirs, mixed with body of filtered water, 401–8, 3154–63; but in cholera district there were other nuisances enough to account for cholera—exposed mud-banks, ditches full of stagnant sewage, crowded dwellings, and polluted wells, 405–17, 465–8, **828–49**, 1037–49, 923, **3190–239**. Could main pipe from Lee Bridge to Old Ford, as it passed under River Lee, have taken in any polluted water through a fracture from open reservoirs? 3162–79. Could there have been any infiltration through subsoil from old reservoirs to new covered reservoirs? 165–74; in spring of 1866 the larger of open reservoirs was emptied by steam power, and after some weeks was found to be full again, partly from rain, partly from infiltration from adjoining open reservoir or from river, 950–63.

[*Numbers* 3236–3336 *are repeated in the Evidence: when in the Index the reference is made to the numbers as used the second time, the numbers are distinguished by an asterisk.*]

EDMONTON:
Witnesses examined,
Chairman of Local Board, Mr. Busk, 3710–94.
Surveyor to Local Board, Mr. Gosset, 3795–854.
Population about 10,000, 3777. Health fair, 3743. SEWERAGE, none but a few short sewers, 3800–2. Not more than 200 waterclosets, 3813. CESSPITS usual, cleaned out by occupiers, 3742–4, 3776; cost, 3828–48; cost to community, 3751. Local Board are being sued by Tottenham Local Board for a nuisance, 3543; are suing Tottenham Local Board for the nuisance of Wood Green sewage, which the Lee trustees will not suffer to be added to Tottenham sewage passing into Lee 3778; are suing Colney Hatch Lunatic Asylum for fouling brook, 3717, 3738–40; have been at litigation with Enfield for a like reason, 3741. WATER SUPPLY, partly from New River, partly by private wells, 3746–51, 3820–4. Water of wells ochrey, 3748; according to analysis not bad, 3849; is it liable to infiltration from cesspools dug in same gravelly subsoil? 3533–7, 3785–6.

ENFIELD:
Witness examined:
Surveyor to Local Board, Mr. Ironside, 3855–949. Population now between 12,000 and 13,000, 3860–1. Rateable value, 3921. SEWERAGE, town of Enfield and town of Ponders End, containing together about 6,000 inhabitants, drained; parish of Enfield not drained, 3873–8, 3919–20. Cost of sewers, 3902–4. Sewers partly ventilated, but free from foul air, 3891–9. Sewage from sewers led through settling tanks, 3881–9; solid matter strained out but of little value, 3908–18; effluent liquid passed into Catchwater dyke and thence into Lee, 3881–9, 3937–44, 4440–1. Local Board a few years ago placed by Edmonton under an injunction not to commit nuisance by sewage, 3905–7. WATER SUPPLY, partly from artesian well at Ponders End, partly from land springs which give a hard water, 3866–72. Water laid on to most houses, 3879–91, 3904. Waste ashes no trouble, 3890. Road-scrapings disposed of, 3900.

EVAPORATION:
658–9—TABLES.

F.

FAIRMAN, Mr. (of Stortford):
Evidence of, 2346, 2409.

FLOODINGS:
Whole valley of Lee liable to, 87; but chiefly below junction of Stort, where river passes on to London clay, 535–41. Liability to, reduced partly by dredging and other navigation works, 778–81, 798, 4888–92, 5087–8. In Stort valley also reduced, 2080–9, 2796. Mischief to land, 2518, 2527–8, 2589–602, 2612–6; to mill power, 2271–3, 2286–8, 2594; to navigation, 2797. Causes of, silting up of bed, 4932–5; artificial obstructions, 1947–68, 5558–63; mill-weirs, **2581–6, 2618**, 5421–9; want of embankments, 542; river not embanked except below Old Ford, 727. Riparian property to a large extent unenclosed, 543, 783–4.

G.

GARRATT, Mr. (of Stortford):
Evidence of, 2546–626, 5330–42.

GEE, Mr. (of Stortford):
Evidence of, 2627–705.

GEOLOGICAL:
Character of basin down to Cheshunt mostly chalk, covered in the valley by beds of sand, gravel, drift, and clay, and in some places patches of boulders, 480, 518, 680–3, 1490–1, 1841–51. Bed of Lee a natural filter. 683, 799–800, 808–11; but at lower end of Stort valley clay, 502–3; and at Broxbourne London clay begins, 693; at Tottenham a bed of gravel over London clay, but only at bottom of valley, 3500, 3514–21, 3524–9.

GLASS, Mr. (Traffic Manager of Lee Trust):
Evidence of, 4733–830.

GLASSCOCK, Mr. (of Stortford):
Evidence of, 2125–248.

GOSSET, Mr. (of Edmonton):
Evidence of, 3795–854.

GREAVES, Mr. (Engineer to East London Waterworks Company):
Evidence of, 66–658; 916–1049.

GRINDLE, Mr. (of Hertford):
Evidence of, 4970–5017.

GUY, Mr. (of Tottenham):
Evidence of, 3556–676.

H.

HAGGAR, Mr. (of Hertford):
Evidence of, 4894–969.

HALL, Mr. (of Tottenham):
Evidence of, 3236*–86*.

HATFIELD:
Sewage, led formerly into a chalk-pit, now into dumb wells, 4586–8.

HAWKES, Mr. (of Stortford):
Evidence of, 2890–924.

HEATH, Mr. (of Tottenham):
Evidence of 3287*–3363.

HERTFORD:
Witnesses examined.
Mayor, Mr. Armstrong, 4176–249.
Town Clerk, Mr. Longmore, 4250–328.
Inspector of Nuisances, Mr. Jarrett, 4654–97.
Surveyor to Corporation, Mr. Wilds, 4698–729.
Manager of Sewage Outworks, Mr. Grindle, 4970–5017.
Mr. Haggar, Seedcrusher, 4894–969.
Mr. Pollard, 5018–21.
Population about 7000, 522: 1069. Local Government under special Acts 4187. Trade, Oil Mills 4190. SEWERAGE: under Hertford Sewage Act of 1854. New River Company has constructed a main sewer intercepting all drainage from river; with this main sewer Corporation has nothing to do except to make connecting house-drains with it, and New River Company has nothing to do with house-drains; neither sewer nor house-drains ventilated; hence bad smell; 1078–82, 4292–308, 4660–1, 4720–1, 5001–17. Outlet of Sewer below intake of New River Company from Lee 1078–82; 4258–64. SEWAGE, before discharge, is dealt with by Higgs' process of precipitation by lime, chloride of lime being added, 1170, solid matter taken out and sold, but fetches a small price, 3766–8, 4972–7, 4992 effluent water discharged into Lee, 4258–64. Sewage much diluted from spring water in sewers, **1083–4**; **2977**. But sewer-outlet very foul, 4401, 4404–8. Effects of pollution felt at Ware, 4407, 5138–41, 5208; at Stanstead, 2303–4. Total outlay by New River Company upon sewer and outlet works, 22,000*l*, annual expense 600*l*. 1312, 4986–92. WATER SUPPLY, two sources both in hands of Corporation, one from Lee above town, the other from well in Hartam, also private wells, 4204–11, 4265–87, 4319–28. Quality, 4200; **4328–9** [PAPER,] 5018–21. Volume, equivalent to 30 or 40 gallons per head of population supplied; gross waste, 4666–97.

HIGGINS, Mr. (of Luton):
Evidence of, 1931–46.

HITCH, Mr. (of Ware):
Evidence of, 5240–329.

HODDESDON:
See evidence of Mr. Manser, 4831–93. Population, 1898, 523. Sewage partially carried out into river, 4430.

HUNT, Mr. (of Stortford):
Evidence of, 2249–2345.

I.

IRONSIDE, Mr. (Surveyor to Enfield Local Board):
Evidence of, 3855–949.

J.

JARRETT, Mr. (of Hertford):
Evidence of, 4654–97.

K.

KNIGHT, Mr. (of Mile End):
Evidence of, 3116–335.

[*Numbers* 3236–3336 *are repeated in the Evidence: when in the Index the reference is made to the numbers as used the second time, the numbers are distinguished by an asterisk.*]

L.

LEE RIVER:
Acts concerning 532–3 *Paper*. Area of basin, 500 square miles, 481. Population of basin down to Hackney exclusive of Hackney and Walthamstow, 174,000, 611–2. Geological character of basin, see *Geological*. Source in a series of springs at Leager Marsh two or three miles from Luton, 1820–4. Height of range of Watershed, 801. Essentially a spring-fed river, springs rising in bed, 684–699, 802, 3049. Liable to be flooded; see *Flooding*. Clears itself very quickly after flood, **816–8**. Tributaries, **532–3** [PAPER.] A Tida- river; extreme point of tide Lee Bridge Mills, five miles from Thames, 86, 725–6. A navigable river, see *Navigation*. Volume of, as gauged at Fielde's Weir at junction of Stort, 702–8, 804–7, as estimated at intake of New River Company, **816–8**. Appropriation of water, see *Navigation; East London Waterworks Company; New River Company*; total volume daily abstracted 43,300,000 gallons from rivers with basin of 450–500 square miles, as compared with 48,375,000 gallons daily taken from Thames basin of 3,500 square miles, 1027–32. Mills upon, see *Mills*. Pollution of, see *Pollution*. Conservancy required for, see *Conservancy*.

LEE RIVER TRUST:
See *Navigation*.

LEGISLATION:
For River Lee, see *Conservancy*.

LIMEHOUSE CUT:
An open cesspool, 843–7.

LITIGATION:
To prevent pollution of rivers and streams.
Edmonton *v.* Colney Hatch, 3717, 3738–40.
,, *v.* Enfield, 3741, 3905–7.
,, *v.* Tottenham, 3543.
Lee Trustees *v.* Metropolitan Board, 4469.
,, *v.* Tottenham, 3263–5, 3280–1, 3303–11, 4451, 4458.
Leigh - *v.* Luton, 1604–14.
Tottenham *v.* Hornsey Board, 3360, 4453.

LONGMORE, Mr. (of Hertford):
Evidence of, 4250–328.

LUTON:
Witnesses examined:
Chairman of Local Board, Mr. Pledge, 1367–419.
Surveyor of Local Board, Mr. Sandoe, 1420–600, 1684–717.
Clerk of Local Board, Mr Bailey, 1601–43.
Officer of Health, Mr. Kit Tomson, 1644–83.
Member of Local Board, Mr. Davis, 2021–46.
Local Registrar and Sanitary Inspector of Board of Guardians in hamlet, Mr. Maffey, 1870–930.
Mr. Willis, straw hat manufacturer, 1718–806.
Mr. Higgins, straw plait merchant, 1931–46.
Mr. Lye, straw plait dyer, 1969–2020.
Mr. Taylor, Bailiff to Mr. Crawley, 1947–68.
Largest town in Watershed of Lee, 477. Population nearly 20,000, 478, 1069, 1371; and fast increasing, 1372, 2021–32. Rateable value, 40,000*l.*, 1373. Health improving, 1409, 1682, 1870–930. SEWERAGE; all houses drained in township, 1421–33; only intercepting sewer ventilated, 1430–1, 1591–5; evil effects of no ventilation, **1676**, 1709. Drains cannot be flushed, but are kept tolerably clear by abundance of subsoil water, and water from dye-houses, 1578–91, 1695; and the fall is good, 1694. Sewers carried under river, as town is on both sides, 1497–9; not liable now to be flooded, as storm-water bed has been made, 1701. SEWAGE from sewers is discharged into river, after treatment by Higg's process; this treatment ordered by injunction procured by neighbouring landlord, 1074–5, 1604–14. Volume of sewage, 1000; contents of 500 waterclosets, 1434–9; outlet discharge about 240 gallons per minute, but great portion of this is spring water which has found its way into sewers, 1457. Sewage first led into settling beds below town, there lime and chloride of lime applied, and liquid allowed to evaporate, 1523–7, 1534–46; sewage then pumped in semi-solid state across the river; when dry, bought by farmers, 1465–6; formerly difficult to dispose of, from 2,000 to 3,000 square yards having been on hand, 1471–7; more than 2,000 tons of solid matter thus annually taken out of depositing tanks, much of it road grit, 1461–70. Original outlay upon sewer and works nearly 15,000*l.*, 1478–9. Annual expense nearly 500*l.*, 1451–6. WATERCLOSETS supplied only by pumps and rain-water, 1434–9; inconvenience of want of water very great, 1743–8. PRIVIES usual amongst poor, 2,000 or 3,000, near to houses, 1503–12. Cesspits, made in chalk, 1513–22; some emptied under directions of Local Board, 1440–9; others not emptied at all, **1921-30**. WATER SUPPLY, deficient and unwholesome; no public supply, but 1200 wells, 1376; in a dry summer half of these become dry, 1671; wells liable to infiltration from cesspits, 1513–22, 1921–30, 1907–8; probably not from sewers, 1678–80, 1696–700. Want of water cause of ill health, **1654–76**; in dry summer of 1864 death-rate rose to 35 in a thousand, 1889. Proper supply needed also for use of waterclosets made and to be made, and for bleaching purposes, 1743–8. Abundance of water in district, 1618–24, 5645. Trade, straw plait. Pollutions from dyeing and bleaching plait, see *Dyeing* and *Bleaching*. All refuse goes into intercepting sewer, 1401–2. SEWAGE IRRIGATION, land available below town, 1615–6, 1852–4; and above town, where soil more favourable, 5646–53. Outlying districts, no sewerage, 1907, 1919–30, 1944–6; no water supply, in time of drought people were reduced to drink out of ponds and out of river, **1891–901**.

LYE, Mr. (of Luton):
Evidence of, 1969–2020.

M.

MAFFEY, Mr. (of Luton):
Evidence of, 1870, 1930.

MALTINGS (pollution of river from):
Witnesses examined:
Mr. Barnard, of Bishop Stortford 2546–626.
Mr. Fairman, ,, ,, 2346–409.
Mr. Hawkes, ,, ,, 2890–924.
Mr. Miller, ,, ,, 2410–446.
Process of soaking barley, 2381–92, 2405–9; effluent water passed into sewers and thence into river, water is thick, 2393, 2400; and if left to stand would ferment, 2419–20; but is cause of little nuisance in the river, 2072–3, 2353–7, 2475–80; contains nothing mischievous to vegetation, and would improve sewage for irrigation, 2421–2, 2480. Malting trade increasing at Stortford, 2349–52, 2361–4; at Ware, 5033, 5055–60.

MANSER, Mr. (of Hoddesdon):
Evidence of, 4831–93.

MANUFACTURING REFUSE:
Pollution of rivers from. See *Bleaching, Dyeing, Malting*. Mills on Lee, corn and oil mills, except Government mills at Enfield, 756–8; mills on tributaries of Lee, corn mills, except one small paper mill at Luton, 760.

MARCHANT, Mr. (of Hertford):
Evidence of, 4329–501, 5564–70.

MARSHALL, Mr. (of Tottenham):
Evidence of, 3364–555.

MARSHALL, Mr. (of West Ham):
Evidence of, 4016–118.

MILE END:
See evidence of Mr. Knight, surveyor to vestry, 3116–335. Infiltration of wells from cesspits, 3190–213.

MILLER, Mr. (of Stortford):
Evidence of, 2410–46.

MILLS:
(1.) Number of, on Lee above Hertford 12, 2621; below Hertford, ; on Mimram, 8, 2618; on Stort, 2818–20.
(2.) Discontinuance of; water power superseded by steam, 2466–7; and itself from various causes diminishing, 2316. 2319. See *Water Supply*.
(3.) Pollution from, very little. All mills on Lee, except Government mills at Enfield, are corn or oil mills, 756–8; but other mills are being started below Enfield, 792–4; mills on tributaries of Lee are corn-mills except one small paper mill at Luton, 760. All mills on Lee between Ware and Lee Bridge (except Government mills and one mill at Broxbourne) belong to Lee trustees, or to one or other of the two water companies, 756.

[*Numbers* 3236–3336 *are repeated in the Evidence: when in the Index the reference is made to the numbers as used the second time, the numbers are distinguished by an asterisk.*]

(4.) Right of, to take water. On Lee no difficulty, the Lee Trust having a paramount statutory right to water for navigation, 4501–2 [Appendix No. 1]. On Stort occasional difficulty between millers and Navigation Company, but mills have superior vested right, 2803–5, 2813–5.

(5.) Floodings occasioned by. Some mills not equal in value to the damage they inflict, **2581–86, 2618,** 5421–9. With proper arrangements mill-power may not be diminished, and all flooding prevented, 5580.

MIMRAM:
The purest stream that flows into London, 686–8, 2617; but polluted by sewage at Whitwell and Welwyn, 2617–8; and by tanyard, 5338. Never overflows its banks, 5338; unless ponded up by mill-weirs which cause great mischief, 2616–8.

MUIR, Mr., Engineer of New River Company:
Evidence of, 1050–366.

N.

NAVIGATION:
I. Of Stort.
Witness examined,
Surveyor of Navigation, Mr. Davis, 2767–889.
Established by statute, 2791; now property of a private firm, 2776–9. The firm do not carry goods, only maintain navigation, 2833. Length of, 2768–71; locks, traffic, and tonnage of boats, 2772–5. Usual draught of water, 2837. Power to dredge, 2792–4. Power to prevent pollution insufficient, **2790, 2806–11, 2888–9.** Right to take water subject to that of mills, 2802–5, 2814. Lock dues, 2863–75. Waste of water in use of locks, 5340–1. Commissioners appointed under Act have died out and their places have not been renewed; want of authority felt, 5340.

II. Of Lee, by Lee River Trust.
Witnesses examined,
Chairman of Trust, Marquis of Salisbury, 4502–653.
Clerk, Mr. Marchant, 4329–501, 5564–70.
Engineer, Mr. Beardmore, 659–915.
Traffic manager, Mr. Glass, 4730–830.
Mr. Manser, 4831–4893.
1. Constitution of Trust.
2. Powers of Trustees.
3. Extent and course of Navigation.
4. Extent and value of Traffic.
5. Financial condition of Trust.

1. Constitution of trust, fixed by statute; now an incorporated body with power to acquire land, **4501–2** [Appendix No. 1]. Trustees, 67 in number, consisting of (*a*) ex-officio members, viz., Mayor and Corporation of London, members of Parliament for certain counties and boroughs, officers of New River Company, and others, 4335, **4501–2** [Appendix No. 1], 4555; and (*b*) of members with property qualification chosen by the Trust, chiefly riparian owners, 889–90, 4557, 4865. All unpaid, 866–8. Some objection felt outside that few business men are elected to the Trust, and that there is no appeal from the Trust, 4866–4869, 5459–68.

2. Powers of Trustees. Ownership of bed of river, 750. Paramount right to fixed volume for navigation, and of entire volume below Tottenham, 4501–2 [Appendix No. 1]. Obligation to execute works for water companies at the expense of the companies, 4489–90. Power to dredge, systematically used, 753; ballast sold and profit made, 4747–8; reaches have been deepened, 4889–92; canal carries barges of 100 tons instead of 40, 4878; in 15 years 160,000*l.* spent in improvements, 874. Power to scavenge exercised, 753. Power to stop casting in of rubbish, if injurious to navigation, 4384–93; but power to prevent pollution insufficient, 4535. Trustees send notices to prevent pollution, **4501–2** [Appendix No. 2]; refuse to grant wharf except upon condition that sewage is kept out, 4462–5; invoke intervention of Thames Conservators for lower part of Lee, 4393–4401. No power to look to drainage of valley, 769. No power over parts of river not used for navigation, 775.

3. Extent and course of navigation, **664,** 728; partly in river canalized, mainly in canals, 774–8. Locks, 20, 730; their construction, 738–42; draught and tonnage, 744. Barges drawn by horses, not by steam power, 745–7. Trustees not themselves carriers; only maintain navigation.

4. Traffic, extent of, **4372–3; 4501–2** [Appendices No. 3 and 4]; **4512–13** [Tables]; **4521** [Tables]; **4830–1** [Appendix No. 1]. Manure carried free, 4497. Rates, 4376–8; 4830–1 [Appendix No. 2]. Value of navigation to Hertford, 4309–18; Hoddesdon, 4843–4, 4849–50; Tottenham, 3547–54; to powder magazines, 4861; to health, 4492; to country at large, 5357–61.

5. Financial condition of Trust. Sources of income. Tolls and payments by water companies, rentals of mills, and sale ballast, 876–81, 966, 4501 [Appendices No. 1, 3, and 4]. Profit goes to diminish mortgage debt, 4340, 4358–70, 4379–82, 4483–8, 4615–30.

NEW RIVER COMPANY:
Witness examined.
Engineer to Company, Mr. Muir, 1050–366, 2976–3115, and 3115–6, [Paper].
I. Constitution.
II. Supply from Lee.
III. Other sources of supply.
IV. Treatment of water.
V. Quantity and quality of water.
VI. Distribution.
VII. Miscellaneous particulars.

I. Constitution.
By Acts of Parliament, 532–3 [Paper], 3115–6 [Paper]. Capital more than 3,000,000*l.* sterling, 3013–4; more about to be raised, 3115–6, Paper.

II. Supply from the Lee.
Right to abstract water fixed by Act of 1855, subject to right of navigation, but superior up to a certain point to right of East London Waterworks Company, 4501–2 [Appendix No. 1]. Payments to Lee Trust, 53,000*l.*, 3104–5, 876–81. Point of intake of water, Balance engine between Ware and Hertford, 473. Area of basin above intake, 244 square miles, 482. Population of basin above intake, **1069–73.** Pollution of Lee; by sewage from Luton, see *Luton;* by manufacturing refuse from Luton, see *Bleaching* and *Dyeing;* not by sewage of Hertford, which is intercepted by sewer constructed by company, see *Hertford.* Company has expended 30,000*l.* on sewerage works, 3109.

III. Other sources of supply.
Chadwell spring, and wells at Cheshunt, Amwell Hill; also, in reserve, wells at Amwell, Hampstead Road, Hampstead Heath, and Hoddesdon, 493–4, 1053–8, 1063, 1182–5, 3005, **3115–6** [Paper]. These give company a command over 35,000,000 of gallons daily, 1182–3. Volume actually used, 22,500,000 gallons, 1185. For non-domestic uses company has right to draw from ponds on Hampstead Heath, and from Thames below Blackfriars Bridge, 3115–6 [Paper].

IV. Treatment of water.
(1) Conduit. Water led to London by New River, a conduit 28 miles in length, 1288–320; carefully looked after, and protected from contamination, 3947–9, 1314–20.
(2) Store reservoirs, **3115–6** [Paper]. Area, 100 acres; capacity, 200,000,000 of gallons, 1103–16.
(3) Filter beds, 11½ acres, the medium being sand; not so large in proportion as those of the East London Waterworks, because water less turbid from flood and less polluted, 1112–24, **3115–6** [Paper]. Expense of charcoal filtration, 1125–37.
(4) Filtered water service reservoirs; capacity 20,000,000 gallons, 3115–6 [Paper].

V. Quantity and quality of water:
Volume supplied about 22,500,000 gallons daily, 1185. Quality, water pure, 1139–41, 2977, **3115–6** [Paper]; but hard, 1146–65; Dr. Clarke's process for softening expensive, and if it superseded filtration would cause deposit in pipes, 1175–81.

VI. Distribution:
Pumping arrangements, 3115–6 [Paper]. Area supplied, 1331–2; Tenements supplied, 111,958; houses, 3115–6 [Paper]. Most have waterclosets, 1186–8. 18,000,000 gallons pumped; 4,000,000 pass by gravitation, 1340. Supply equivalent to 30 gallons per head of population of district, 1339. Supply constant only to those who take proper precautions against waste, about 1200 in number, 1192–8, 1210–11, **3115–6** [Paper]. To others intermittent; on six days in the week for a time long enough to fill cisterns; and on Sunday, also in some poor districts (nearly 50,000 houses) where provision to receive water is bad, **3115–6** [Paper]. Arrangements by landlords to receive water miserably defective even for intermittent supply; and constant

[*Numbers* 3236–3336 *are repeated in the Evidence: when in the Index the reference is made to the numbers as used the second time, the numbers are distinguished by an asterisk.*]

supply impracticable; poor very ill off for water, 1211–35, **3115–6** [Paper]. Much water wasted; 7 gallons a head really enough; the cistern system might be usefully extended, 3080–97. Maximum prices with many exceptions, 1199-201, 3115–6 [Paper]. The supply might be increased and improved if flood waters of river stored in reservoirs; if sewage were kept out; if water economised, and filtered water not wasted in watering streets, 3008–21, 3099–102.

VII. Miscellaneous particulars :
Water for fire extinction supplied gratuitously; also cheap plug, but not expensive hydrants, 1203–4, **3115–6** [Paper]. Head of water, 1280–7. Water rarely injured by proximity of gas-pipe, 1257–8, 3062–77. Complaint book, 3032–3.

O.

Old Ford :
Pestiferous from discharge of manufactories, &c., 4462. Outfall of works of Metropolitan Board, 469–4482.

P.

Parker, Mr. (of Ware) :
Evidence of, 5343–485.

Perry, Mr. (of Stortford) :
Evidence of, 2925–75.

Phillips, Mr. (of Tottenham) :
Evidence of, 4141–60.

Pledge, Mr. (of Luton) :
Evidence of, 1367–419.

Pollard, Mr. (of Hertford) :
Evidence of, 5018–21.

Pollution of Lee :
A. Above intake of New River Company.
By sewage, and bleaching and dyeing refuse from Luton, see *Luton, Bleaching, Dyeing*. By privies at Welwyn and Whitwell on Mimram, 2617–8, 5654–7. By sheepwashings, 5332–6.
B. Between intake of New River Company and intake of East London Waterworks Company.
By sewage of Hertford, see *Hertford;* of Ware, see *Ware;* of towns on Stort, see *Stortford*, 655; and by Maltings, see *Maltings*. Stort gets fouler and fouler, every house and farm drains into it; mud sludged out by millers, **2559–64**, 2571–5, 5654. By sewage of Hoddesdon, Broxbourne, Cheshunt, Waltham Abbey, Waltham Cross, 101, **514–28**, 655, 3337–9.
C. Between intake of East London Waterworks Company and Thames.
By sewage of Enfield, Ponder's End, Upper and Lower Edmonton, and part of Tottenham, which comprise 52,000 persons, intercepted in Catchwater Dyke made by East London Waterworks Company 612, 4501–2 [Appendix No. 1], 3266*, 3314*, 3465–71, 3666–9, 4443–6. By sewage of Tottenham, see *Tottenham*. Below Tottenham river very foul; from manufactories, 4751–2, 4768–9; from sewage of more thickly populated neighbourhood; Leighton, Leightonstone, Walthamstowe, 3555; Old Ford, 4462, 832–3; Metropolitan outfalls, 4469–82; West Ham, **4059**, see *West Ham*. Silvertown, **4067**; Limehouse cut, 843–7, **4501–2** [Appendix No. 1]; pollution increased by effects of tide, 826–8, 842–9, **923**, 1037–49, 4060–4.

Privies, see *Barnet, Edmonton, Luton, Mile End, Stortford, Tottenham, Ware, Welwyn.*

R.

Rainfall :
In east London district averages 26 inches in the year, 596, at Fielde's Weir, 700–1 [Paper].

Reservoirs :
For flood waters none, 531; scarcely possible in porous soil of upper Lee Valley, 3047–9; *secus*, in lower valley on London clay, 3050–3, 5623–5, 5657–60; recommended by Mr. Rendel, 5390–408.

Riparian Property :
Much of it unenclosed, might be improved by drainage and embankment, 783–91. See *Floodings*, and evidence of Mr. Taylor, 1947–68.

Road Scrapings :
Sold, 3579–80.

S.

Salisbury, Marquis of :
Evidence of, 4502–653.

Sandoe, Mr. (of Luton) :
Evidence of, 1420–600, 1684–717.

Sawbridgeworth :
Population of, 524.

Scavenging :
Done systematically by Lee Trustees, 753, 4926–8; not done on Stort, 2565–7, 2811.

Sewage :
Pollution by, see *Pollution, Litigation, Barnet, Colney Hatch, Edmonton, Enfield, Hertford, Hoddesdon, Luton Stortford, Tottenham, Ware, West Ham.* Irrigation with, see *Barnet, Colney Hatch, Luton, Stortford, Ware, West Ham.* Interception of, at the lower end of Lee Valley, **3450–75**, 3545–6, 3770, 5593–644, 5654*a*–667, 5668–88. Suggestion by Mr. Bailey Denton. For low level an intercepting sewer to Barking Creek, there to join metropolitan system or sewage to be treated like metropolitan sewage; for high level, irrigation, and delivery into Lee below intake of East London Waterworks Company. Scheme might be enlarged beyond Waltham Abbey, **5667–8** [*Paper*].

Sheep-washing :
Pollution of rivers from 5332–6.

Silvertown :
Not drained by West Ham Local Board, 673-5.

Solid Refuse :
Not much thrown into Lee: power of trustees to stop it, 763–72.

Straw Plait Manufacture :
Witnesses examined.
Mr. W. Willis, of Luton, 1718–806.
Mr. Higgins „ 1931–46.
Mr. Lye „ 1969–2020.
Trade more than a million sterling annually, 1801, 1935 half of population of Luton engaged in, 1750. Pollution of river from, see *Bleaching* and *Dyeing*.

Stort, Valley of :
Chalk overlaid with clay, 2090–3; the floodiest stream running to London, 2594: but in drought quickly falls off, 813–5, 2080–4. Pollution of, by sewage of Stortford, see *Stortford:* by refuse from dog-kennels, 5654: the river getting fouler and fouler: every house and farm drains into it: at Raydon mill the miller sludges mud down stream, **2559–75**. Navigation of, see *Navigation*, and evidence of Mr. Davis, 2767–889.

Stortford :
Witnesses examined.
Clerk to Board of Guardians, Mr. Taylor, 2047–124.
Surveyor to Highway Board, Mr. Glasscock, 2125–248.
Clerk „ „ Mr. Gee, 2627–705.
Surveyor of Stort Navigation, Mr. Davis, 2767–889.
Manager of Gasworks, Mr. Perry, 2925–75.
Mr. Hunt, mill owner, 2249–345.
Mr. Garratt, „ 2546–626, 5330–42.
Mr. Fairman, maltster, 2346–409.
Mr. Miller, „ 2410–46.
Mr. Barnard, „ 2447-545.
Mr. Hawkes, „ 2890–925.
Mr. Odams, „ 2706–66.
Population more than 5,000, not increasing, 2050–1, 524. Rateable value, 23,700*l.*, 225. Local Government Act just about to come into operation, 2059–62, 2499–500, 2634. Public health pretty good, 2063–4. Trade, malt, 2070. Sewerage nearly throughout town, but unsystematic, 2134–5; sewers not ventilated, **2153–8**; ill-constructed, have to be opened for a great length in order to be cleaned, 2144–52, 2433. Sewage from sewers discharged into river at seven outlets, 2136–8; river falls very low in summer and becomes very foul, **2203–23**, 2256–63, 2428–9, 2689–700, 2710–5, 2718–22, 2786–90, 2806–10, 2851–2, 2879a. Ill health caused by sewage deposit, 2450–5. Authorities flush

[*Numbers 3236–3336 are repeated in the Evidence: when in the Index the reference is made to the numbers as used the second time, the numbers are distinguished by an asterisk.*]

sewage accumulations down stream by means of barge and rake, **2105–6**, 2460. Complaints made by people at Sawbridgeworth, 2103, 2495-6, 2661–6, and at Harlow, 2457. Waterclosets 300, supplied by water pumped up, 2141–3. Privies, some discharge into river, 2906–7, 2667–9. Ashpits cleansed once in the last seven years from fear of cholera, 2165–72. Cesspools common in houses which have access to sewers, 2233–4; 400 in number, 2141; generally in impervious stratum, 2161–4. Sewage Irrigation, 15 feet of fall within one and a half miles of town, 2437–46, 2481, 2716–7; land might be had, but liability of low land to flooding, a difficulty perhaps to be met by choosing a higher site and pumping, 2166–9, 2199–202. Water Supply from private pumps, but abundant, 2089, 2189–98; 2917–24.

T.

Tan:
Refuse on Mimram, 5338.

Taylor, Mr. (of Luton):
Evidence of, 1947–68.

Taylor, Mr. (of Stortford):
Evidence of, 2047–124.

Tomson, Mr. (of Luton):
Evidence of, 1644–83.

Tottenham:
Witnesses examined.
Chairman of Local Board, Mr. Hall, 3236*–286*.
Clerk, Mr. Heath, 3287*–3363.
Surveyor, Mr. Marshall, 3364–555, 3555–6, [Paper].
Inspector of Nuisances, Mr. Guy, 3556–676.
Registrar of Births, Mr. Ross, 4161–75.
Mr. Delano, 4119–40.
Mr. Phillips, 4141–60.
Population nearly 18,000. Area, 4,624 acres. Houses, 4,000. Rateable value, 91,000*l.*, 3555–6 [Paper]. Health improved by sewerage and sanitary works, 3242*–82*. Mortality, 3282*–6*. Sewerage, formerly only cesspools, discharging into Lee, 3292*–6*, 3561–4. Now sewerage constructed throughout one half of district, 3555–6 [Paper,] 3303*–6*. Sewers well flushed, but with no special ventilation, 3475–96. Wood Green district sewered, but sewers not used, 3280*–1*. Some cesspools in gravel in Page Green district, 3531–6. Sewage from about 2,000 waterclosets, 3408; of 7,000 to 10,000 persons, 3407; is subjected to liming process, then cast into River Lee, 3241*, 3276*–9*, 3401–2; process entirely fails to purify, 4447–60; outlet a nuisance by pollution to river, 3262*. Lee trustees have obtained an injunction against Tottenham Local Board adding sewage of Wood Green district to sewage of Tottenham proper, 3280*–1*, 3263*–5*, 3303*, 4458; consequently house drains of Wood Green not connected with sewer recently made, and cost of sewer, 9,000*l.*, thrown away, 3280*–1*; temporary cesspools made in Wood Green district, chiefly in clay, 3311*, 3522, 3618–21; and are a nuisance to Edmonton, 3778. About 4,000 waterclosets in parish, 3555–60 [Paper]. Higgs' process of treatment of sewage now disused; a commercial failure; works bought by Local Board for one fourth of prime cost, 3376–427. Now only lime used, 3646–63; about 100 tons per annum, 3395, 3405. Solid refuse sold at 2*s.* 6*d.* per ton, 339€–8, 3609–17; accumulated in large quantities, 3592–603. Annual cost of works to Local Board 130*l.*, 3413–23. **3555–6**, [Paper.] Sewage Irrigation, soil, marsh land and stiff clay; valuable, 3322*–5*. Irrigation tried for a while successfully on 40 acres, 3428–40; but prejudice against it, 3440–6; best plan, Tottenham sewerage to be merged in Metropolitan sewerage system, 3326*; or combined with other parishes, 3329*–31*, 3450–75; and sewage pumped into Essex, 3537–9. Nuisances in parish; Muswell River very filthy in summer from sewage of Wood Green and Hornsey 4144–60; and from drainage of cemetery, 4162–3. Catchwater Dyke, a ditch made by East London Waterworks Company, intercepting sewage from Ponders End and other villages passing through parish, and delivering into Lee, 3758–64, 3266*, 3314*, 3465–71, 3666–9, 4443–6. Discharge from works between outfall of Catchwater Dyke and Tottenham outfall; sewage from Edmonton, Enfield, &c., 3314*–7*, 3340–2. Water Supply; in hands of board partly from pumps, 3267*–75*; partly from land springs in gravel overlying clay, 3497–513, **3555–6** [Paper]. Water from gravel, hard, ochrey, and corrosive of iron pipes, causing leakage and short supply, 3677–709, **3555–6** [Paper]; liable to injury by infiltration of sewage from Edmonton cesspools, 3531–6; *secus* 3785–6. Wood Green district supplied by New River Company, 3275.

W.

Waltham Abbey:
Population 5,000, 522; sewage of, a nuisance, enters London above intake of East London Water Works, 4437–40.

Ware:
Witnesses examined.
Clerk to Local Board, Mr. Cobham, 5022-184.
Officer of Health, Mr. Butcher, 5285–239.
Surveyor, Mr. Hitch, 5240–329.
Inspector of Nuisances, Mr. Bond, 5486–536.
Mr. Parker, 5343–485.
Mr. Brown, mill owner, 5537–55.
Mr. Beningfield, auctioneer, 5556–63.
Population over 5,000, 522, 5024. Trade, malting, 5033, 5055–60. Sewerage; entire town underdrained. 5036; about 220 waterclosets, 5256; sewers not ventilated, but not complained of, 5272. Sewage of sewers passes into Lee by five outlets; net, except from dilution of spring water escaped from subsoil into sewers, 2305, 5038, 5255, 5290–4. Great nuisance at outfall, 3766, 4408–17, 4572, 4501–2 [Appendix No. 1]; *secus*, 5289. Privies also and drains discharged into river, 4428, 5308–13. Houses not having waterclosets, have cesspools, which are emptied by owners, 5069–77, 5295–301, 5529–36, 5492. Refuse cast into gravel pits, 5507–20; finds no sale amongst farmers, probably because devoid of liquid passed into subsoil from cesspools, 5535–6. Sewage Irrigation; land available below town, and fall convenient, 5147–52. Water Supply, no public supply; only from private pumps in gravel; cesspools also in gravel, the new ones cemented not the old ones, 5062–8, 5262–71; no ill-health traced to corrupt water supply, 5224–31.

Waterclosets:
See *Barnet, Edmonton, Enfield, Luton, Stortford, Tottenham, Ware, West Ham, East London Waterworks Company*, 312, and 658–9 [Appendix No. 1], *New River Company*, 1186–8.

Water Power:
Irregularity of 2550, **2589–90**, injured by floods 2271–3, 2594; 2286–8; decreasing on tributaries? 2316–9 on Lee 2305–25, 2329–45, on Lynch unaltered 4840. See *Mills*.

Water Supply:
See *Barnet, Edmonton, Enfield, Hertford, Luton, Stortford, Tottenham, Ware, West Ham, East London Waterworks Company, New River Company.*
Difficulty of increasing; water-bearing subsoil of Lee Valley is so porous that if tapped it would give out into sewers the sewage it had absorbed, 709–11, and if intercepting sewers laid down, they would carry away spring water, 712–23, 822. Possibility of Storage Reservoirs, see *Reservoirs*. Economy in supply possible; 11 gallons enough with care 3131, 1018–20, and see *East London Waterworks Company, New River Company* and *Tottenham*.

Weeds:
Good for water, except in autumn, when they decay, 1142–5.

Weirs:
Ancient, on Lee, 677–9; now iron instead of wood, so as to give more waterway 4888, disputes as to, on Stort, 4875–6.

Well:
Infiltrated with sewage in East London, **1022–6**, 3190–203. Edmonton? 3533–7, 3785–6. Luton, 1513–22, 1921–30, 1907–8, 1654–76. Tottenham? 3531–6, 3785–6? Ware 5062–8, 5262–71.

Welwyn:
Pollution of Mimram at 2617–8.

[*Numbers* 3236–3336 *are repeated in the Evidence: when in the Index the reference is made to the numbers as used the second time, the numbers are distinguished by an asterisk.*]

West Ham:
Witness examined:
Engineer to Local Board, Mr. Marshall, 4016–118, 4118–9 [Paper].
Population 60,000, fast growing 4021, 4028–31. Area 5,000 acres, 4118–9 [Paper]. Rateable value 160,000*l.*, 4032. Health improved by sanitary arrangements, 4118–9, [Paper]. Sewerage; 10,000 out of 12,000 houses drained, 4118–9 [Paper]. Cost of, 4033–5. Sewers work well, ventilation perfect, 4050–7. Silvertown, cut off by Victoria Docks, unsewered and a cause of pollution, 4066–7. Sewage passes into Lee; partly pumped at cost of 1,000*l.* per ann., partly by gravitation, 4038–9 Place of outlet Bow Creek, 4020. Time chosen whilst tide is receding to prevent sewage returning to Lee, 4096–100. Proposed outlet to Barking, 4085–90. Waterclosets no trouble, 4024; and a vast improvement upon former condition when privies and cesspools discharged into ditches, 4118–9 [Paper]. Sewage Irrigation tried experimentally and promised to be successful, but land in neighbourhood too valuable, 4040–8, 4077–84, 4111–8. Water Supply, East London works, 4025–7; Local Board endeavours to compel owners to provide means at houses for receiving water, but legal powers insufficient, 4101–10. Low cellars by Barking Road 14 feet below high-water line, 4073–7.

Wilds, Mr. (of Hertford):
Evidence of, 4698–729.

Willis, Mr. (of Luton):
Evidence of, 1718–806.

COMMISSION.

VICTORIA R.

Victoria, by the Grace of God, of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith.

To Our trusty and well-beloved Robert Rawlinson, Esquire, John Thornhill Harrison, Esquire, and John Thomas Way, Esquire, greeting.

Whereas We have deemed it expedient for divers good causes and considerations that a Commission should forthwith issue for the purpose of inquiring how far the present use of rivers or running waters in England for the purpose of carrying off the sewage of towns and populous places, and the refuse arising from industrial processes and manufactures, can be prevented without risk to the public health or serious injury to such processes and manufactures, and how far such sewage and refuse can be utilised or got rid of otherwise than by discharge into rivers or running waters, or rendered harmless before reaching them; and also for the purpose of inquiring into the effect on the drainage of lands and inhabited places of obstructions to the natural flow of rivers or streams caused by mills, weirs, locks, and other navigation works, and into the best means of remedying any evils thence arising.

Now know ye, that We, reposing great confidence in your zeal and ability, have authorised and appointed, and do by these Presents authorize and appoint, you, the said Robert Rawlinson, John Thornhill Harrison, and John Thomas Way, to be Our Commissioners for the purposes aforesaid.

And for the better enabling you to form a sound judgment on the Premises, We do hereby authorize and empower you, or any two or more of you, to call before you, or any two or more of you, all such persons as you may judge most competent by reason of their situation, knowledge, or experience, to afford you correct information on the subject of this inquiry.

And it is Our further Will and Pleasure that you, or any two or more of you, do report to Us in writing, under your hands and seals, your several proceedings by virtue of this Our Commission, together with your opinion on the several matters herein submitted for your consideration.

And We Will and Command that this Our Commission shall continue in full force and virtue, and that you, Our Commissioners, or any two or more of you, may from time to time proceed in the execution thereof, although the same be not continued from time to time by adjournment.

And for your assistance in the due execution of this our Commission, We have made choice of Our trusty and well-beloved Godfrey Lushington, Esquire, Barrister-at-Law, to be Secretary to this Our Commission, whose services and assistance We require you to avail yourselves of from time to time, as occasion may require.

Given at Our Court at Saint James's, the Eighteenth day of May 1865, in the Twenty-eighth Year of Our Reign.

By Her Majesty's Command.

(Signed) G. GREY.

Instructions to the Commissioners.

Gentlemen, Whitehall, May 30, 1865.

Her Majesty having been pleased to appoint you to be Commissioners for Inquiry into the Pollution of Rivers, I am directed by Secretary Sir George Grey to send you the following instructions for your guidance in the proposed inquiry.

Although it may be taken as proved generally that there is a wide-spread and serious pollution of rivers both from town sewage and the refuse of mines and manufactories, and that town sewage may be turned to profitable account as a manure, there is not sufficient evidence to show that any measure absolutely prohibiting the discharge of such refuse into rivers, or absolutely compelling town authorities to carry it on the lands, might not be remedying one evil at the cost of an evil still more serious, in the shape of injury to health and damage to manufactures. It is, therefore, suggested that your inquiry should include selected river basins, illustrating different classes of employment and population; that these river basins might be:—

1st. The Thames Valley—both as an example of an agricultural river basin, with many navigation works, such as locks and weirs and mills affecting the flow of water, and many towns and some manufactories discharging their sewage and refuse into the stream from which is mainly derived the water supply of the metropolis.

2d. The Mersey Valley—including its feeders, particulary the Irwell, as an example of the river basin, most extensively polluted by all forms of manufacturing refuse, particularly that arising from the cotton manufacture and processes connected therewith.

3d. The Aire and Calder Basin, as an additional example of the same class, particularly in connexion with the woollen and iron manufactories.

4th. The Severn Basin, for the same reason, but in particular connexion with the great seats of the iron trade.

5th. The Taff Valley, in connexion with mining and industry applied to metals.

6th. A river Basin comprising a mining district in Cornwall.

Your special points of inquiry should, it is conceived, be in the Thames Valley. 1. The condition of the river as affected by mills, weirs, and locks, and as affecting the drainage of towns and villages and adjacent lands. 2. The condition of the river, as affected both by the discharge of sewage from towns and villages, and the refuse of manufactories, paper mills, &c., and the possibility of intercepting and rendering useful or innocuous these sources of pollution.

As to the other rivers mentioned, the main object of the inquiry should be how far the use or abuse of the rivers is, under present circumstances, essential to the carrying on the industry of these districts? How far by new arrangements the refuse arising from industrial processes in these districts can be kept out of the streams, or rendered harmless before it reaches them, or utilised or got rid of otherwise than by discharge into running waters? In the course of these investigations you will make inquiry into the effect on health and comfort of the existing system of sewage of towns and populous places in the districts examined, and into the best mode of protecting individual and public interests in the purity of running water.

Secondary questions will, no doubt, arise contingent on these leading points, in which case you will include them, as far as it is necessary, within the scope of your inquiry.

I am, &c.

(Signed) H. Waddington.

R. Rawlinson, Esq.,
J. T. Harrison, Esq.,
J. T. Way, Esq.,
Commissioners to inquire into the
Pollution of Rivers.

Letter from H. Waddington, Esq., to the Commissioners appointed to inquire into the Pollution of Rivers.

Gentlemen, Whitehall, July 7, 1865.

I am directed by Secretary Sir George Grey to transmit to you an extract of a letter from Mr. Charles Neate, and to state that it will be desirable to include in your inquiry into the Pollution of Rivers, the subject of the water supply suggested by Mr. Neate, provided such extension of your inquiry will not materially impede or delay the completion of the primary object of the Commission.

I am, &c.

The Commissioners appointed to inquire into the Pollution of Rivers,
2, Victoria Street, S.

(Signed) H. Waddington.

Letter from Charles Neate, Esq., M.P., to the Right Honorable Sir George Grey, Bart., G.C.B., M.P.

Dear Sir, House of Commons, June 27, 1865.

I beg to submit to you, with reference to the Commission recently issued to inquire into the means of remedying the pollution of rivers, that as the scope of that Commission has already been enlarged beyond its original and professed object, so as to include an inquiry into the drainage of "lands and inhabited places," it would be right to extend the inquiry still further as to include the great question of the water supply.

Even if the drainage referred to in the Commission is that only which is required for sanitary purposes, it may still be a question whether you might not subject the health of the country to far greater danger by wasting too rapidly the winter supply of water than it now is liable to from the temporary dampness of the soil in certain places.

The effect of drainage, even to the extent it has been already carried out for agricultural purposes, is a subject of serious alarm to many people, and I think it is matter of pressing interest to inquire how far the general level of springs in the country has been lowered, how far it depends upon the height at which the water is maintained in the neighbouring river, and what is the number of springs that have altogether failed, or at least that fail during the summer.

I believe it to be a matter of urgent necessity to provide reservoirs of water throughout the country, to be used for all purposes but drinking, and that the spring water should be habitually confined to that use.

If the Commission, as it stands, is intended to apply to agricultural drainage, the reasons for extending the inquiry are more, still more cogent, for then it is no longer a conflict between one sanitary purpose and another, but between the health of the country and some increase in the productiveness of the soil.

I remain, &c.

The Right Honorable Sir George Grey, Bart., G.C.B., M.P., &c., &c., &c.

(Signed) Charles Neate.

P.S. I think it would be a great point to inquire whether all the surface drainage of towns might not conveniently be kept out of the service and taken into the rivers.

SIR, Whitehall, June 24, 1867.

I AM directed by Mr. Secretary Hardy to transmit to you the Warrant under Her Majesty's Royal Sign Manual appointing Ralph Augustus Benson, Esquire, to be Secretary to the Rivers Pollution Commission, in place of Godfrey Lushington, Esquire, who has resigned such appointment.

I am, &c.

Robert Rawlinson, Esq., C.B. (Signed) H. WADDINGTON.

VICTORIA R.

Victoria, by the Grace of God of the United Kingdom of Great Britain and Ireland Queen, Defender of the Faith.

To Our trusty and well-beloved Robert Rawlinson, Esquire, Companion of Our most honorable Order of the Bath, John Thornhill Harrison, Esquire, and John Thomas Way, Esquire, greeting.

Whereas We were pleased by Warrant under Our Royal Sign Manual bearing date the Eighteenth day of May 1865, constituting you, Our Commissioners, to make inquiry into the Pollution of Rivers, and for the other Purposes therein set forth, to appoint Godfrey Lushington, Esquire, barrister-at-law, to be Secretary to the said Commission:

And whereas the said Godfrey Lushington hath resigned such appointment:

Now know ye that, in room of the said Godfrey Lushington, we have made choice of Our trusty and well-beloved Ralph Augustus Benson, Esquire, barrister-at-law, to be Secretary to such Commission, whose services and assistance We require you to avail yourselves of from time to time, as occasion may require.

Given at Our Court at St. James's the Twenty-second day of June 1867, in the Thirty-first Year of Our Reign.

By Her Majesty's command.

(Signed) GATHORNE HARDY.

THIRD REPORT.

TO THE QUEEN'S MOST EXCELLENT MAJESTY,

MAY IT PLEASE YOUR MAJESTY,

WE, Your Majesty's Commissioners appointed to inquire into the pollution of rivers and running waters, having reported on the main stream of the river Thames and on the river Lee, now proceed to report on the rivers Aire and Calder, the principal seat of the Woollen and Worsted trades in the West Riding of Yorkshire.

Having made preliminary inspections of the West Riding district during portions of the summer of 1866, we proceeded to hold our public inquiries during the autumn, in the following order:—

Name of Town.	Name of River.	October.	November.	December.
Wakefield	Calder	16th.	—	—
"	"	17th.	—	—
"	"	18th.	—	—
"	"	19th.	—	—
Dewsbury	Calder	22d.	—	—
"	"	23d.	—	—
Huddersfield	Colne, tributary of Calder	25th.	—	—
"	"	26th.	—	—
"	"	27th.	—	—
Leeds	Aire	—	6th.	—
"	"	—	7th.	—
"	"	—	8th.	—
"	"	—	9th.	—
Bradford	Bradford Beck, tributary of Aire	—	13th.	—
"	"	—	14th.	—
"	"	—	15th.	—
Halifax	Hebble Beck, tributary of Calder	—	16th.	—
"	"	—	17th.	—
Todmorden	Calder	—	19th.	—
Keighley	Worth, tributary of Aire	—	27th.	—
"	"	—	28th.	—
Skipton	Aire	—	29th.	—
Pontefract	Aire and Calder united	—	30th.	1st.

In prosecuting our inquiries we received all the assistance we required from the several Municipal Corporate bodies, Towns Commissioners, Local Boards of Health, Parish authorities, and others. In no instance did any of the manufacturers applied to decline to allow their works to be inspected, or to furnish information as to the materials used and pollutions caused to running waters. The evidence, as published in detail, shows that on the contrary, in many instances, considerable expense and labour were incurred to obtain special information for our use to enable us to ascertain the leading facts bearing on the question of rivers pollution which we were commanded to report upon.

The rivers Aire and Calder have this in common with the Thames and Lee, upon which we recently reported, that they are navigable streams, and are polluted by town sewage; but the Aire and Calder suffer to a far greater extent than the Thames and Lee from manufactures, by which they are in some instances polluted to the utmost limits of which they are capable.

While domestic water supply to the populations seated at various points upon their banks, and to 3,037,991 persons inhabiting the Metropolis, is by far the most important use to which the waters of the Thames and Lee are appropriated, the water of the Aire and Calder, and that of their numerous tributaries is, in consequence of its foul condition, not used so much as it formerly was for domestic purposes, but mainly for carrying on the Worsted and Woollen manufactures, and other important trades of the district. Thus the rivers Thames and Lee require to be purified, that their waters may be preserved wholesome for domestic uses. The rivers Aire and Calder require to be

improved and conserved, that injurious flooding may be prevented; they should be protected from pollution, that the trades established in the district may be carried on to the greatest advantage, and means should be afforded to preserve the water pure for the domestic purposes of a large population.

Yorkshire: its Topography, Meteorology, Geology, &c.

Yorkshire, the largest county in Britain, containing 5,983 square miles, and in 1861 a population of 2,015,541, is bounded on the north by Durham, on the east by the North Sea, on the west by Westmoreland, Lancashire, and Cheshire, on the south by Derbyshire, Nottinghamshire, Lincolnshire, and the river Humber, and is divided into three ridings—North, East, and West. The Pennine mountain chain extends from Scotland, forming the western highlands of Yorkshire, on to Derbyshire. The highest points in this mountain range are Mickle Fell, 2,600 feet, Whernside, 2,384 feet, and Ingleborough, 2,361 feet above medium tide level. The north-western portion of the county consists of Cambrian, Silurian, Scar limestone, and Yoredale rocks; on the eastern slope of this range of mountains, Millstone grit of varying breadth forms moor and mountain from Durham to Derbyshire. The Yorkshire coal-field extends from Leeds in the north to Derbyshire in the south, and is in area about 700 square miles. A considerable breadth of Mid-Yorkshire is New Red Sandstone, with a strip of Permian strata on the west. In the south-eastern portion of the county, from the Humber to Filey Bay, the subsoil consists of Chalk. From Filey Bay northward to the Tees mouth are found Coralline oolite, Bath oolite, and Lias shales. Alluvium, such as boulder-drift, clay, silt, gravel, and sand is found in the valleys.

The geographical configuration of the West Riding of Yorkshire and its geology are alike favourable to the establishment and prosecution of manufactures requiring water. The mid-mountain ranges of this portion of England trending north and south are at a sufficient elevation to intercept rain-clouds and condense vapour brought from the Atlantic Ocean by the south and west winds. The strata are well fitted to receive the rain, and to pass it down through the numerous rivulets, streams, and rivers. The main dividing ridges being to the west, and for the most part forming the boundary of the county, the greater portion of rain precipitated flows through the county eastward to the North Sea. It has been calculated that, out of each 100 parts of rain-water falling on the surface and flowing off either from springs or floods, 80 parts find their outlet by the Humber, 13 parts direct to the North Sea, and only seven parts into the Irish Sea.

The West Riding is traversed from east to west by three valleys almost parallel. These are the vales of Wharfe, Aire, and Calder. Mountains of millstone grit, largely covered with moorland, bound the coal-field of Yorkshire on the north and west, and it is from this stratification that much of the pure spring water is derived. Bradford, Halifax, Dewsbury, and some other towns have recently constructed impounding reservoirs on the millstone grit for their domestic supply, and also for trade purposes.

The rainfall over Yorkshire varies with relative position and elevation. On the south and eastern part it is least, having an average annual fall of about 20 inches. The middle district, up to an elevation of 1,000 feet, averages about 30 inches; and on the mountain ranges and their slopes down to 1,000 feet of elevation the average rainfall varies from 30 inches up to 80 inches.

The surface area of a country, the amount of rain falling and of vapour condensing upon it, and the capacity of the subsoil-rocks for receiving and storing water form data from which to calculate the approximate yield of any watershed. Rain-gauges indicate the volume of rain falling in their immediate vicinity, but actual gaugings of water flowing off the ground give the only reliable data as to the dry weather and ordinary volume of water discharged. River floods cannot accurately be measured as to volume, neither can the injurious effects of such floods be easily estimated.

Over all this district dry and wet years vary about as 1 to 2. Where averages have been made from continuous observations over 30 or 40 years it will be found that deducting one third will indicate the total fall of rain in a dry year, and adding one third will give the fall or excess of rain in a wet year. On the south-east coast a dry year's rainfall will be 14 inches, and a wet year 28 inches. In the middle district a dry year will be 20 inches and a wet year 40 inches, or thereabouts. The dry weather flow of water on the surface is modified by aspect, elevation, surface-contour, and most of all by the geological character of the subsoil. The perennial flow is modified by

these conditions and by the amount of rainfall, as also its times and modes of falling. The actual flow of water from the ground as measured in springs, streams, and rivers varies in accordance with climate, volume of rain falling, the period or season within which the rain falls, the character of the subsoil, surface-contour, and some other conditions; but under the most favourable conditions much of the rain is again evaporated.

In the drainage areas of the Thames and Lee, where accurate gaugings of the rain and measurements of the rivers have been taken for waterworks purposes, it is found that out of an annual average fall of 27 inches over the area of the Thames watershed, one-sixth percolates and forms springs, one-sixth passes off as flood water, and four-sixths are evaporated; while in the case of the Lee watershed, where the average rainfall is 25 inches, nearly four-fifths pass off by evaporation.

These proportions are, however, only an approximation to the averages of rainfall given; with greater or less rainfalls on the same areas the proportions will vary. It might be supposed that some water is absorbed in the strata and so is lost or expended in the sea at great depths below the surface. No experienced geologist will, however, admit this as a practical solution. Springs, as a rule, deliver the absorbed rainfall of such a district as the West Riding of Yorkshire at the surface and at no great distance. There may be some small springs in the sea having their origin near the shore, but not of volume seriously to affect the question. Limestones, which are much fissured, are uncertain in their surface-delivery of water where small areas have to be considered, but are more conformable to a general law where large areas have to be relied upon. Limestones are wasted and more or less fissured and caverned by the solvent action of soft water, so that there may be areas of surface of many acres in extent receiving and absorbing or evaporating all the water falling on the surface; such areas are not fitted for the formation of impounding reservoirs, as fissures not showing themselves at the surface may exist, which, when covered with water under pressure, would receive and discharge the entire volume at some point below, as in the case of the water from Malham Tarn. The enormous waste in limestone strata constantly and silently taking place by the solvent action of soft water can only be roughly indicated. Rain water, when brought into contact with lime rocks possesses the power of dissolving and removing as much as 20 grains of carbonate of lime in each gallon; taking a mean of 15 grains to the gallon, more than one ton of carbonate of lime is removed with each million gallons of water.

The dry weather flow from the whole of Yorkshire may be about a half cube foot of water per second from each 1,000 acres. The flood flow on the mountain slopes is from 200 to 500 cube feet per second from each 1,000 acres for short intervals. The beneficial use of rivers depends on the dry weather and medium flow. Floods are to be guarded against as liable to cause injury, of which much experience has been gained during the autumn, winter, and spring of 1866 and 1867. Excessive floods have been hitherto very little modified, either by land drainage or by storage reservoir making, but abuse by throwing solids into the streams, encroachments, and general neglect have tended to aggravate their destructive effects. A full history of the neglect and abuse of the streams in Yorkshire during the last half century, and of the consequent losses by floods, ought to teach the manufacturers that nature will take her own mode of avenging herself.

Rainfall and rivers mould and modify the surface of the land. Sunlight, wet, frost, and wind expand, dissolve, disintegrate, and disperse the solid materials exposed to their unceasing action. Rain forms springs, and rivulets; these form rivers, and by their combined action solids are chemically dissolved and mechanically washed down to the ocean. Bright and sparkling water generally contains carbonate of lime. Bright brown (or coffee-coloured) water is usually soft and derives its colouring from dissolved peat. Muddy water contains the fine particles of rocks in suspension, the weight of the solids removed being in proportion to the volume and velocity of the water in the river, and the geological formation of the district drained. From the mountain sides of Yorkshire heavy rain washes down masses of rock, boulders, gravel, and sand to an enormous extent; these solids tend to block the beds of the streamlets and rivers, and where manufactures have been established much damage to property occasionally takes place by flooding.

District of the Rivers Aire and Calder.

The district watered by the rivers Aire and Calder forms part of the great drainage area of the river Ouse, which contains 4,207 square miles. The main watershed falls from the north and west to the east.

	Sq. Miles.
The basin of the river Aire is - - - - -	342½
The basin of the river Calder is - - - - -	366
The basin of the united rivers from Castleford to the Ouse -	85½
Total area - - - - -	794

The springs above and within Malham Tarn, situated on Scar limestone, at an elevation of 1,243 feet above Ordnance datum, form one of the main sources of the river Aire. This tarn, or small lake, is near the ridge dividing the watersheds of Westmoreland, Lancashire, and Yorkshire. It is bounded on the north and west by Kilnsea Craig, 1,475 feet elevation, Hard Flask, 1,746 feet, Bordley Mastiles, 1,346 feet, and Fountains Fell, 2,190 feet. The limestone is fissured immediately below the outlet of Malham Tarn, the whole volume of water being absorbed by "swallow holes," to re-appear at about two miles distance in Malham Cove.

The river Calder rises at an elevation of about 1,500 feet, on the mountain ridges of millstone grit dividing Lancashire and Yorkshire; two small streams, the Cal and the Der, united near Todmorden, becoming after this junction the Calder. The Aire and Calder, uniting their streams at Castleford become the Aire until joining the Ouse, which river finds an outlet through the Humber to the North Sea.

The watersheds of the Aire and Calder may be tabulated as respects their geological characteristics as under—

	Area of Scar Limestone in Square Miles.	Area of Millstone Grit in Square Miles.	Area of Coal formation in Square Miles.
The basin of the Aire - -	95	137½	110
The basin of the Calder - -	—	191	175
Total - -	95	328½	285

	Area of Permian in Square Miles.	Area of New Red Sandstone in Square Miles.	Area of Alluvium in Square Miles.
The Aire after its junction with the Calder down to the Ouse - - -	30	30½	25
Total square miles -	30	30½	25

Abstract.

Total area of the combined watersheds - - -	794

Obstructions and Pollutions of the Rivers Aire and Calder.

The rivers Aire and Calder throughout their whole course are abused, obstructed, and polluted (to an extent scarcely conceivable by other than eye-witnesses) from Skipton on the Aire, from Todmorden on the Calder down to Castleford. Our inspection

was corroborated by uncontested and overwhelming evidence; by the engineer to the Aire and Calder Navigation as also by the men employed in dredging. Pollution by solids—ashes, mud, and other "powse"—is increasing and will yearly become worse unless some remedial measures be rigidly enforced.

It is impossible to treat quite separately the questions of obstruction and pollution. In many cases, where solids are carried into a stream, both injuries are of course inflicted upon it.

The rivers Aire and Calder, and their tributaries, are abused by passing into them hundreds of thousands of tons per annum of ashes, slag, and cinders from steam-boiler furnaces, ironworks, and domestic fires; by their being made the receptacle to a vast extent of broken pottery and worn-out utensils of metal, refuse brick from brick-yards and old buildings, earth, stone, and clay from quarries and excavations, road scrapings, street sweepings, &c.; by spent dyewoods and other solids used in the treatment of worsteds and woollens; by hundreds of carcases of animals, as dogs, cats, pigs, &c., which are allowed to float on the surface of the streams or putrify on their banks; and by the flowing in, to the amount of very many millions of gallons per day, of water poisoned, corrupted, and clogged by refuse from mines, chemical works, dyeing, scouring, and fulling worsted and woollen stuffs, skin-cleaning and tanning, slaughter-house garbage, and the sewage of towns and houses.

The practice of periodically flushing out into the streams the mud which must under any circumstances accumulate in goits, culverts, mill reservoirs, or "lodges" and canals is also a palpable abuse.

It would be impossible to calculate the extent or the profit to which the natural products of the West Riding, stone, coal, iron, and other minerals, have been worked, while the profits realized in the textile manufactures of worsteds and woollens since the modern establishment of those trades (about the year 1735) might perhaps exceed the amount of our national debt; and the trade, according to the evidence we have received, is still on the increase in the few places where water fit for use can be obtained.

But the growth of manufactures, the accumulation of wealth, and the increase of population in the West Riding are intimately connected with the abuse and pollution of its rivers. Many streams, where, by reason of their foulness, no form of life can at present be found, persons now living recollect abounding in fish. These appear to have been totally destroyed by the accumulated filth and the amount of solid refuse carried in suspension, as, in a large reservoir into which the river water at Wakefield is passed and where the water being at rest is clarified by mere mechanical subsidence of the solids, fish live and breed; nor will they be killed, as has been ascertained, even by the flow of town sewage *while it is fresh*, where it does not exceed one-tenth the volume of the stream into which it passes, and where the water is in unceasing motion downwards, not tidal as in the Thames at London.

The rapid increase of all forms of manufacture, as now carried on in Great Britain, received an immense impetus by the maturing of mechanical power through the aid of steam. Water-power is uncertain and troublesome, and its utmost limits may soon be reached on streams such as those in Yorkshire. There are no large lakes in the West Riding to equalize the delivery of water, but the manufacturer must be subject to the irregularity of seasons involving excesses of droughts and floods. Artificial reservoirs, which have been in some places constructed, in proportion to their capacity and management, tend to equalize the delivery of water, but they are costly to construct; and if not efficiently managed, they may become eminently dangerous and awfully destructive, as at Holmfirth, and at Sheffield.

Steam-power has consequently been provided to an enormous extent, in many instances to supplement water-power, but in more instances to be the prime and sole agent; and it involves the annual use of millions of tons of coal. Of this there remains on an average about one-eighth, after combustion, in the form of solid cinder or ash; and in the numerous valleys where large mills have been erected with steam-power, mill above mill, cinder and ash resulting from their vast consumption of coal has been and is at this time being thrown into the adjoining watercourse, so that during dry weather periods the greater portion of the bed of the river opposite such mill or works is filled by the "cinder tip." A stranger to the district, looking upon such state of things for the first time, thinks it must be the deliberate intention of the manufacturer, for some trade purpose or other, entirely to block the river at this point. In other instances a "slag or cinder tip" is made parallel to the banks of a rivercourse to a depth of many feet, and at the steepest angle the materials will form. In both cases flood-waters are expected to wash the solids so arranged down

the river, regardless of all contingencies to other riparian proprietors. To these the consequences are inevitably disastrous, and the practice can scarcely be considered an advantage to the manufacturers who so abuse the streams. One result of this form of abuse is the gradual raising of the beds of the rivers above their former levels, and so causing floodings over the adjoining lands, and in some cases damaging mills. For purposes of trade, many of the millowners on the streams and rivers where land is available, construct "*goits*" and "*lodges*" to store water and obtain head for power, as also to allow of subsidence that the water may be used for washing and dyeing purposes. There are lines of mills so provided for, one below the other on the same stream. The uppermost mill receives water in the purest state; but even in so advantageous a situation sludge accumulates, both in the goit and in the lodge. This mud is periodically flushed out into the river, to foul its bed below, and portions of such mud are necessarily received into the next goit and lodge; the same sort of process going on, with the addition of cinders and dye-waste, to the last or lowest mill on that stream, the river below being ultimately polluted by the whole accumulated mud, dye-waste, and refuse ashes of the entire district above. The streams and rivers are further abused by the inhabitants generally who live on their banks, whether residing in isolated houses, villages, or towns; and so far has this abuse grown into a general practice, that even legally constituted Parish and Township authorities, Local Boards of Health, and the more dignified Municipal Corporations either directly practise abuses or connive at them by permitting their continuance. The streams and rivers seem to be considered the cheapest scavengers and removers of waste solids.

The penalties which nature exacts of the inhabitants of a district who so violate common sense by systematic abuse of water-courses are severe. When we commenced our recent inquiries in the West Riding, one opinion was reiterated by the witnesses examined, namely, that floodings by the rivers were neither so common nor so severe as formerly. Reservoir making to impound flood waters, and land-draining, with general cultivation, were supposed to have so modified all former conditions that flooding, as in olden times, was deemed impossible. The inhabitants of the valleys of the rivers Aire and Calder, because damaging floods had not occurred for several years, concluded that no more such floodings would take place. But before we had completed our inquiries, and whilst we were sitting taking evidence in Halifax, on Thursday 15th of November 1866, rain had commenced, and continued for several days flooding the valleys of the Aire and Calder most destructively from the mountains to the sea.* This flood rose as high and did far more damage to property than any flood at any former period. In several instances persons were washed away and drowned. It is not possible to form any reliable estimate of the money value of the damage it caused in the worsted and woollen districts to the manufacturers, landowners, and others of the West Riding, the property of so many thousands of persons having been destroyed or damaged. The total loss was locally estimated at from half a million to one million sterling. The lesser sum, if laid out in works of permanent improvement, would have been sufficient to put the rivers in condition to render such destruction of human life and great waste of property impossible. The loss by many thousands of the working classes and their families of time, wages, and of health, consequent on this week's flooding must also have been great, as, when such floods subside, damp floors and damp walls remain for many subsequent weeks, causes of discomfort and of disease. But as previously stated these excesses may be guarded against. Making additional impounding reservoirs will tend to equalize the flow of flood waters from small areas, but there must not be less than 100,000,000 gallons of storage to each 500 acres of gathering ground to control floods, and even then a flood may come down upon a full reservoir, almost as strong as if no reservoir existed. Under-draining and cultivating land may pass surface or rain-flood waters more rapidly, but neither reservoir making, land draining, nor cultivation will affect the amount of evaporation from the oceans and consequent rainfall. This is and ever will be entirely independent of any works of man. Evaporation is continuous, and dependent on the sun's heat; condensation is due to terrestrial influences, and may be very unequal from local causes. It is sufficient to know that excesses in rainfall may be repeated, will inevitably be repeated, and cannot be prevented. Any work, to be useful, must provide means to lessen contingent damages: these floods warn us that neglect and abuse of rivers cannot be continued with safety either to life or to property. The neglect consists in allowing gravel, sand, and silt washed down from the mountains to raise the beds of the streams; the abuses consist in

* See Appendix No. I., p. lvii.

deliberately further filling those beds with cinders and ashes from steam-boiler furnaces, and with other refuse solids previously mentioned; or, as at some of the great ironworks, forming slagheaps parallel with the river, and tipping refuse along the slope; besides which obstruction has been offered to the free flow of flood waters by unjustifiable encroachments; dams, walls, culverts, &c., as also by bridges and other public works of defective construction. It is worthy of remark in respect of the most salient feature in this obstruction of rivers, namely, the practice of throwing in vast quantities of cinder and ash from the mills, that it is closely allied to another nuisance, that of polluting the atmosphere by the emission of dense volumes of smoke from factory chimneys. In our inquiries as to the weight of ashes produced and what became of them, we learned that in the use of any coal, rich and bituminous or poorer and more earthy, if there be careful firing and perfect combustion there will be less cinder as well as less smoke. Experiments have proved this fact. Some large mills have their machinery driven by steam boilers which do not produce smoke, but prolong the life of the boiler, work at less risk of explosion, and with greater economy; and yet this practice does not become general, because there is some expense in alterations to steam-boiler furnaces in the first instance, and care in firing, as also in general management, is required subsequently. As ashes must be removed at a cost proportionate to the distance to which they must travel, and the difficulty of finding places of deposit, it is satisfactory to find that their bulk can thus be materially reduced by smoke consumption with increased profit to the manufacturer.

Pollution by Sewage.

The pollution by which we found the rivers Aire and Calder most grievously affected consist partly of such as are common to all streams flowing through a densely populated district, as town sewage, but, in a greater degree, of refuse solid and liquid from the special manufactures established upon them and their tributaries.

The amount of solids taken into the streams by sewers is in the aggregate throughout the West Riding enormous. At Leeds the volume of sewage passing into the Aire is from eight to ten million gallons per day, the entire weight of solids being swept out therewith; and this is the case throughout the district wherever main sewers and drains exist. In no single instance did we find any system of intercepting the solids from sewage, such as has been enforced at Birmingham, the corporation has been compelled to construct tanks for the purpose. The dry weather flow of sewage of Birmingham is about ten million gallons per day, and it is found that the weight of solid intercepted amounts to some 25,000 or 30,000 tons per annum, including to some extent refuse from manufactories and grit from the roads, all of which formerly contaminated and silted up the banks and bed of the river Tame. Interception of solids in this manner is, however, not to be advocated as a substitute for sewage irrigation.

Most of the towns in the West Riding have been partially sewered, and some houses have also been drained; but in no single instance has this necessary work been thoroughly done. The entire volume of sewage at Leeds (fluids and solids) is passed direct into the river Aire. This is also the case at Bradford, by the Bradford Beck; and at Keighley, and at Skipton. The river Calder receives sewage from Todmorden, Halifax, Huddersfield, Dewsbury, Wakefield, and smaller towns, villages, mills, and houses. No town or village intercepts sewage. At most of the large mills the privies for the workpeople are arranged in such manner that the excrements fall into a receptacle which can be removed to land where they are applied to purposes of agriculture, but even at these places the arrangements are neither so cleanly nor so inodorous as they ought to be and may be. Where sewers and drains are not admissible, the dry-earth closet, or some such arrangement, if well attended to, will be less offensive than where no other disinfectant is used. *Dry-earth closets are partially in use at Wakefield House of Correction in separate cells, and they may be made to answer for mill hands, for villages, and for groups of houses, as also, of course, for single houses; they are, however, by no means to be advocated as preferable to sewers, drains, and water-closets. The present gross abuse of the rivers which we inspected may in a great measure be prevented, and in such manner and at such cost as to be beneficial to all parties. Sewage may be purified by passing it over the land, and the solids of dye-waters and other refuse waters may be filtered out so that the streams may become clean.

* See Appendix No. II., p. lix.

The dark and foul appearance of the West Riding rivers is mainly due to insoluble dye-matter discharged from the works; but dye-refuse in general, though in this sense highly objectionable, really tends to a considerable extent, by the disinfecting action of the mineral ingredients and acids it contains, to neutralize the corruption of town sewage. Where, on the other hand, the dye refuse is not discharged in sufficient quantity, that offensive matter, deposited on the beds and banks of the streams, becomes, in dry weather, putrid and stinking, and in floods is stirred up and floated forward to poison the navigable parts of the river and the canals, where deposit can again take place. The most notable case of extreme pollution on record is that of the Bradford canal.

The sewering of towns is a complex question and requires to be specially studied, so as to effect the greatest amount of good at the least risk of polluting water-courses; natural streams, as small brooks, should not be arched over and formed into sewers, neither should rivers be made the receptacles of sewage. The largest proportion of rainwater may in all cases be turned over the surface into the natural streams; it will not be necessary to form duplicate systems of sewers and drains, but it will require intelligent and careful attention to preserve surface gradients and natural outlets for storm waters, and, where these have been tampered with, to restore and improve them. The sewers and drains of a town should provide for the removal of subsoil water, the slop and waste water from houses, and the contents of waterclosets; these sewers and drains may have storm overflows in connexion with the natural streams of the district so arranged as to prevent flooding of houses or bursting of the sewers during thunder-storms. All dry-weather sewage and such portion of the surface water due to moderate falls of rain as finds its way to the sewers will flow down with the sewage to the outlet, and be a manageable volume either to apply by gravity, or to be pumped to land for agricultural uses.* The remark may be made that, when the sewers overflow, the streams will be polluted; this is true, but the pollution will be a minimum, the sewage will be in extreme dilution, and the natural streams of the district will be in flood and most probably muddy by grit and silt washed in from road surfaces, and by fine particles of soil from the banks and the surfaces of the land. Floods caused by heavy rains ever have been turbid and ever will be turbid.

There are large areas of land, both in the Aire and Calder valleys, which would be greatly benefited by a proper application of sewage. It may be profitably applied to the production of Italian rye-grass. Where sewage will flow over a sufficient area of land by gravity there ought to be the best return for the expenditure, but towns having populations of 10,000 and upwards may venture to incur the cost of pumping sewage, and so reach land less valuable than the rich garden or meadow land at lower elevations. The only general rules applicable to sewage irrigation in all cases are that the works should be simple and cheap. Land to be irrigated does not require costly work in shaping and levelling, neither need there be expensive tanks to receive and store sewage; heavy clay land which has been ridge and furrow ploughed may have the surface brought to an uniform slope by lowering the ridges and filling in the furrows so as to prevent sewage, when applied, falling into each furrow as into a conduit, leaving the ridges comparatively bare. Such work may cost about 5*l.* per acre. Small fields may have useless hedges removed, so as to have larger areas at command. Underdraining may or may not be necessary; this must be settled after an examination of the subsoil to be dealt with. If underdraining be adopted, deep drains answer best, and these should be laid so as to extract water and admit air. Where the surface-contours will allow of interception, sewage water from drains may be turned on to the land three or four times with advantage and with a certainty of extracting more of the salts of sewage. Sewage meadows ought to be laid out on a plan similar to that adopted for water meadows. Carriers should contour the surface, at intervals apart, in proportion to the character of the soil and the slope of the surface. Where main open carriers may be considered a nuisance, as near houses, roads, or foot-walks, they may be covered conduits having cheap outlet-valves at a chain apart; carriers in the fields may be open grips formed with plough or spade, and such as to be broken up if necessary when a change of crop is made. A cheap main carrier can be formed with common agricultural drain tiles, butt-jointed, laid half in and half out of the ground; a single pipe or length of pipes can then be removed by hand at any point to allow of irrigation, and these same pipes can be readily replaced again. Where foul smells are complained of as coming from sewage-irrigated lands the causes are in the state of the sewage and in the rude mode of using it. If old and putrid

* See Appendices III. IV. V., pp. lix, lx, lxi.

sewage is stored in large tanks or is conveyed in large open ditches which are never cleaned there will be offensive taint. Fresh sewage does not give off so offensive a taint, and if conveyed at once by covered conduits to land, all nuisance ceases immediately. Cast-iron piping and hose and jet application are costly to provide and expensive to manipulate. If they are adopted, some special reason must have been urged to warrant this form of extra outlay, as for lawns and fields near houses, or for gardens. The produce from properly irrigated land will be from five to tenfold that of the same land under ordinary cultivation. Sewage evenly and regularly applied to the growth of Italian rye-grass, on any soil, will produce from 30 to 60 tons weight of green grass on each statute acre per annum. The celebrated Craigentinny meadows near Edinburgh, principally sea sand, have produced from 40 to 60 tons per annum to each acre, and let by auction at rents varying from 25*l.* to 35*l.* the acre. At South Norwood and at Worthing clay land out of which bricks are made is irrigated with town sewage, and produces from 40 to 50 tons of Italian rye-grass to each acre. In neither case is the land underdrained, and Mr. Marriage, of Croydon, prefers to irrigate without draining. We would by no means be understood to undervalue the advantage of draining claylands in general. Sewage irrigation may be carried on throughout the entire year, and grass may be cut at Christmas. In early spring, and weeks before ordinary cultivation will produce green crops fit to cut, from four to five tons per acre may be got from sewaged land. At such times the grass sells at 15*s.* and 20*s.* per ton on the field. Six or seven crops of grass may be cut during the year, but until the watercloset system be more efficiently carried out than we found it in the towns of the West Riding, the full advantage of this mode of sewage application will not be realized.

It has been asserted that sewage-grown grass is unwholesome, and will not make good hay. The grass is, however, not only wholesome, but cows fed upon it give richer milk from which first-class butter may be made. The chemist proves by careful analysis that both milk and butter are better than samples produced from the same land in its ordinary state of meadow. Hay made from sewage-grown grass is also sweet and nutritious if properly got, but there is great difficulty in fully drying it during ordinary seasons.

When a limited quantity of sewage or other water containing manure soaks into a fertile soil, the first effect is to displace part of the water already contained in the soil, occupying its place in the interstices, whence the organic matter it contains is held in temporary union with the active soil, to be afterwards absorbed by the roots of plants or decomposed by the air, so that in a short time, varying according to the activity of vegetation and of decomposition, no impurity whatever remains. If then the sewage which has soaked into the soil is not displaced by other water until a sufficient time for it to be purified has elapsed, it will when displaced be as pure as ordinary shallow spring water. If it be found that the depth of the active soil effecting this change is about half a yard, and that it contains about one fifth of its weight of water, a quantity of sewage may sink into it equal to about 500 tons or a depth of five inches, before the water previously in the soil within 18 inches of the surface is all displaced; and if considerably less than this proportion of sewage, say one to two inches in depth, be put on rich soil at once, though the drains from it will run freely, as they do after heavy rain, they will be carrying away the water previously in the soil, and not, as is often supposed, that just poured upon it, which may with good management be retained in the soil until it in its turn becomes completely purified; and the water passing from the deep drains of irrigated land not over-manured may be as pure as that from the shallow springs of such land, all that is necessary for this result being that considerably less water be added to the soil at once than it previously contains, and that excessive manuring be avoided. During rapid vegetation an additional purification of the sewage matter takes place from actual contact with the growing plants on the surface.

The area of land in proportion to population for sewage irrigation will vary. If the object be to clarify sewage on the least area, irrespective of obtaining the greatest weight of produce or the highest standard of purification, subsoils of sand or of gravel answer best; such land acts as a filter, absorbing large volumes of sewage, the water flowing through the subsoil; but this mode of dealing with excessive quantities of sewage on permeable soil is not to be recommended where there are wells or streams to be tainted. On poor land from 5,000 to 20,000 tons of sewage per acre per annum may be so filtered, whereas on good land, where paying crops and perfect purification are looked for, 6,000 tons per acre per annum is as much as can be profitably applied. One hundred tons of sewage represents about one inch in depth

over one acre; and so in the same proportion for less or greater volumes. Where sewage is regularly and evenly applied over properly prepared surfaces, and the effluent water is as evenly and regularly removed, the surface is not turned into a swamp. In the neighbourhood of Edinburgh 70,000 and even 120,000 tons of sewage are said to have been floated over each Scotch acre of the sea sand without such result. There must be impeded surface and subsoil drainage, causing stagnation and saturation, to produce a swamp; ordinary rainfall can do it without any sewage being added. All natural bogs, marshes, and swamps are caused by water impeded in its flow and retained stagnant in the subsoil and on the surface. There are hundreds of thousands of acres in the river valleys of England, at elevations from a few feet to several hundred feet above the sea, which are swamps because arterial outlets and land drainage are neglected. If sewage irrigation produces a swamp in any case, it will be through faulty laying out of the land, deficient subsoil and surface drainage, and bad management generally, rather than in the volume of sewage applied.

Civilization in its arrangements and necessities may be compared to a machine. A rude and simple machine works well under the management of a peasant, but as it becomes more complex in construction, more delicate in its parts, more refined in its operations, so, in like proportion, must those to whose hands its working is entrusted be more and more specially educated, skilful, and attentive. Modern civilization in Great Britain abstracts population from the country to aggregate it in towns, and this has gone on during the last half century, with an ever increasing speed. Cities and towns in mediæval times had little in the way of sanitary works to be kept in order. There were no sewers or drains; pavements in streets were rude, and their cleansing was neglected; excrements and garbage were cast forth into the public ways, to be washed by rain into mud or dried into dust by sun, as the seasons favoured one action or the other. At all times the public health was deteriorated by the accumulated and neglected filth, and when several seasons of bad weather followed each other, ordinary fevers ripened up into sweating sickness, putrid typhus, and plague. The rude municipal machine of mediæval times, jolted to destruction. General district rates had not been invented, because there were no district works to keep in order, as the old Saxon law inculcated individual action or expended its powers in enforcing monopolist restrictions. A large modern town may be compared to a large modern mill or factory which is built story above story, each room being full of machines, complex in design, delicate in their parts, and requiring specially educated and skilled labour successfully to manipulate and work them. In a modern town there are main sewers and house drains, waterworks and gasworks, each interlacing streets, courts, and yards, with mains and branch-pipes; then there are surface pavements, channels, and foot walks to keep in order and to cleanse. Sewage poured into the nearest stream pollutes the water, and cesspits crowded amidst houses breed fever. If all cesspits are abolished in favour of the watercloset system there will be more sewage to contend with, and if this is to do the least injury and the greatest good, it must be used unceasingly in irrigation. Waterworks, gasworks, sewers, drains, and street pavements, to be of the greatest service, must not only be skilfully designed and executed, but they must be intelligently managed; and as with the working machine of refined and complicated parts there must be care and skilful management, so in like manner complicated sanitary arrangements in towns require the attention of specially educated men. Local self governors do not always recognise this necessity; and by attempting to work with uneducated and underpaid labour they bring discredit on their local works. If arrangements for the prevention of river pollution be added to the other duties of a local surveyor, the sanitary machine to be kept in order will be more complex. As neglect in mediæval times allowed all the terrible diseases incident to town populations to ripen up into devastating plague, so imperfect sanitary works and regulations in towns at the present day allow excessive rates of mortality to prevail, as set forth weekly, quarterly, and annually in the Registrar General's report. In this report we have shown that abuse and neglect of running waters and rivers has begun most seriously and injuriously to affect trade, both by spoiling the running waters for further uses, and blocking rivers so as to cause destructive floodings. These growing evils can only be diminished by wisely devised works and regulations. A complicated and delicate piece of machinery can only perform the work it was designed for when in perfect order and under perfect management. Sanitary works and arrangements in towns, and especially in manufacturing towns, will only produce beneficial results under skilful superintendence unceasingly applied. It will be in vain to multiply preventive works and establish new regulations unless they are managed and maintained with the necessary skill and care.

Woollen and Worsted Trade, Description, and Statistics.

A glance at table D of the interesting and valuable returns (pages xviii, xix.) will inform the reader that woollen and worsted products to the extent of 384,200,000 pounds in weight, and of a value of 64,400,000*l.* sterling are annually sent out of the mills of Great Britain.

The West Riding of Yorkshire is not the only district in which this vast industry is located, but it may safely be taken that from one-half to two-thirds of the woollen and worsted trade is carried on there.

This trade is of ancient date in England. The Romans had weaving establishments of woollen cloth at Winchester, where the copious springs from chalk afforded means both for power and for washing and dyeing. The mother of Alfred the Great is recorded to have been skilled in spinning wool. Flemish woollen weavers settled in England about the time of the Norman Conquest, and continued immigration of woollen weavers from Flanders took place in the reigns of Henry I., Henry III., Edward I., and Edward III. The woollen tissues first spun and woven at Worsted, in Norfolk, about the year 1388, became the staple trade of Norwich. Devonshire manufactured woollens soon after the introduction of the trade into England, and Worcestershire a little later. Friezes were also early manufactured in Wales. In the middle of the sixteenth century, Berkshire took the lead in woollen manufacture.

About the middle of the last century the West Riding of Yorkshire became the seat of the Worsted and Woollen trades. Halifax began to be specially noted for Kerseys. From about this date, these trades finding so much water available not only for power but also for washing, dyeing, scouring, fulling, and all other purposes, the Yorkshire manufacturers and traders were enabled to undersell those of other places.

The rivers Aire and Calder were made navigable by Act of Parliament about the year 1698, and have from time to time been improved so as to meet and supply the requirements of a growing trade. This navigation has such advantages, and has been so ably managed up to this date, that it successfully competes with the established railways.

It is of the utmost importance to study the rise, progress, and condition of any manufacture, especially if it has changed its locality. Successful trade is generally contingent upon local natural advantages which forethought and care may improve, or which continued abuse may deteriorate and even ultimately destroy. The West Riding of Yorkshire, and especially the Aire and Calder district, possesses many natural advantages favourable to the establishment and conduct of trades requiring good water. A range of mountains, composed principally of Scar limestone and Yoredale rocks, capped with Millstone grit, forms the western boundary, and sends down numerous spring-fed rivulets and streams to wind and flow over the entire breadth of this portion of the county. The graduated fall affords means of obtaining water-power, and the numerous valleys offer favourable sites for storage reservoirs. The vast numbers of mills and dyeworks (upwards of 5,000) established since the commencement of the present century, and the rapid growth of the worsted and woollen trades of the West Riding, clearly indicate that the natural advantages of this part of Yorkshire are great. There are not only spring and river water, but there is also cheap fuel obtained from the local coal-field, enabling the manufacturers to supplement water-power with steam, and, in numerous instances, to obtain all the power required from steam alone. Abuses in the district by throwing solids into running waters and by pollution have, however, become in some cases destructive to trade, and in numerous cases prohibitive to further extensions. Some branches of trade having migrated to Scotland where water less polluted is obtainable.

The various processes to which water is put in cleansing wool and in manufacturing Woollens and Worsteds may be stated as under:

1. Scouring the wool with a ley and hot water, to remove grease and dirt.
2. Washing with clean cold water.
3. Dyeing, when the cloth is to be wool-dyed.
4. Scouring cloth with fuller's earth to remove oil and size.
5. Dyeing, when piece-dyed.
6. Milling or fulling, with soap and warm water, either in the fulling-stocks or in the improved milling machines, where the cloth is squeezed between rollers.
7. Scouring, to remove the soap.
8. Boiling cloth to give it a permanent face.
9. Steaming, to take away the liability of the finished cloth to spot.

Dirty water may be used for power, but even for such purpose it is a nuisance, and, for washing and dyeing, water may be so polluted as to be injurious even to dark and coarse goods, and totally unfitted for cleansing and dyeing fine fabrics.

The vast interests involved in the Wool, Woollen, and Worsted trades of Great Britain are set forth in the following Statistical Tables kindly furnished to the Commission by Mr. Jacob Behrens, vice-president of the Chamber of Commerce of Bradford.

Table A.

Estimate of the Produce of Wool in the United Kingdom, from 25,795,708 Sheep based upon a Return made for Great Britain on the 5th March 1866, and for Ireland in 1865.

Mem.—The number of sheep in Ireland under one year old is supposed to bear the same proportion to the whole number as that given in the Return for Great Britain.

——	Number of Sheep.		Weight per Fleece.	Wool produced.
	Under one year old.	One year old and above.		lbs.
In England -	4,505,345	10,620,196	6½ lb.	69,031,274
„ Wales - -	380,854	1,287,809	5½ „	7,082,250
„ Scotland -	1,624,638	3,630,439	6½ „	23,597,853
„ Ireland - -	1,048,491	2,640,251	6 „	15,841,506
Isle of Man & Channel Islands	24,410	33,196	6½ „	215,774
	7,583,817	18,211,891		
Under one year old Hoggets -	5,583,817		6 „	33,503,293
Lambs killed and clipped.	1,000,000		3 „	3,000,000
Lambs killed and not clipped.	1,000,000		0 „	0
				152,272,650

Table B.

Estimate of the Quantity and Value of Wool and similar material worked up in Worsted and Woollens.

Mem.—Import, Exports, and Values from Board of Trade Tables for 1864, except quantity of English Wool, for which see A.

——	Produce and Imports.	Exports.	Retained for Home Consumption.	Price per lb.	Value. £
English Wool -	152,272,650	7,320,299	144,952,351	2/4½*d.*	17,213,075
Foreign „ -	206,473,045	55,993,803	150,539,242	1/6½*d.*	11,123,905
Goats' Hair or Wool	4,737,330		4,737,330	2/8½*d.*	650,191
Home-made Shoddy	52,000,000		52,000,000	5*d.*	1,083,334
Imported Shoddy -	22,482,880		22,482,880	4¾*d.*	494,611
Wool Extracts -	5,000,000		5,000,003	6*d.*	125,000
Foreign Yarn -	4,479,984		4,479,984	4/6*d.*	1,008,004

Under the name of Shoddy, which occurs so conspicuously in the foregoing tables, an enormous weight of material is used which until recently was waste. Shoddy was first introduced into use about the year 1813, at Batley, near Dewsbury. Mungo was adopted in the same district but at a later period. Shoddy is the produce of soft woollen rags, such as old worn-out carpets, flannels, guernseys, stockings, and similar fabrics. "Mungo" is the produce of worn-out broad or similar cloths of fine quality, as also of the shreds and clippings of cloth. It was stated at our inquiry that the term arose in consequence of the difficulty at first of manipulation. A manufacturer gave some of the materials to his foreman, who, after trial in the shoddy machines, came back with the remark, "It winna go," when the master exclaimed, "But it mun go." These woollen rags are collected, packed in bales, and are imported from Russia, Egypt, Turkey, the entire area of Europe, India, China, and, in fact, from all parts of the world where woollen garments are worn and rags are produced and can be collected. They come to Yorkshire from districts where plague, fever, smallpox, and loathsome skin diseases extensively prevail. The bales are opened and the rags are sorted by human fingers before being placed in machines which break up, tear, separate, and cleanse the fibre for manufacturing uses. According to the evidence we obtained no disease has ever broken out amongst the persons who so manipulate these old woollen rags, although in many of the countries in which they are collected they are believed to be peculiarly plague-bearing materials. The lapse of time in collecting, storing, and transmitting these rags, as also the possible destruction of any special poisons by friction or otherwise, must be taken into account. The whole of the facts deserve, however, the serious attention of those persons who insist that the power of communicating disease is contained in a dangerous manner by woollen goods which have been worn by persons suffering from contagious diseases. The experience obtained by the manipulation of shoddy for upwards of 50 years proves that old woollen rags are not in any degree dangerous to the health of those who work amongst them.

The shoddy trade, as now carried on in the West Riding, is a remarkable instance of the utilization of waste material. The term "shoddy" was, in the first instance, one of reproach, but this has ceased to be. Shoddy now enters into honourable companionship in official returns with British and foreign wools, mohair, silk, and cotton, and is used by manufacturers throughout the woollen and worste ddistricts. By recent returns (1866) the total weight of wool and goat's hair of home and foreign growth used, was about 310 millions of pounds; the total weight of shoddy and extracts for the same period was about 74½ millions of pounds, or some 33¾ thousand tons, so that shoddy now forms near one-fifth by weight of the woollen and worsted manufacture of the district. The woollen trade of Great Britain could not be carried on to its present extent without shoddy.

Shoddy is mixed with wool in proportions from one-third to two-thirds shoddy or mungo, and is used in the manufacture of cheap broadcloths, finer cloths for ladies' capes and mantles, pilots, witneys, flushings, friezes, petershams, duffels, honleys, paddings, linings, cloths used for rough and loose great coats, office coats and trousers, pea-jackets, and blankets. A considerable quantity is used in the form of flocks for beds. Felted cloth is extensively manufactured; it dispenses with spinning and weaving, depending on the felting property of wool by reason of the curl in the fibre. The process is carried on by the aid of warm moisture, pressure, and milling; such cloth is used for table covers, horse cloths, carpets, paddings, druggets, and the coarser and thicker kinds for covering steam-boilers, steam-pipes, and ship's bottoms beneath the copper. Some of the finer and better class of felted cloths are printed.

The manufacture of shoddy and mungo need not produce any special pollution.

The rags are torn into fibre by machines specially prepared, and the dirt, dust, and fine particles of wool are blown out in such manner that this refuse can be collected and sold for manure. About one seventh by weight of shoddy is so cleansed out as waste in preparing it. The price obtained for it as manure varies from 10*s.* to 20*s.* per ton. Some of the richer sort of waste shoddy is sent into Kent as a dressing for hop-growing.

Pollution by Manufactures.

It has already been stated that, although the introduction and perfection of the steam-engine in the last century has enabled woollen manufacturers to dispense in great measure with water *as a source of power*, they are still absolutely dependent upon an abundant and tolerably pure supply of this element for the successful prosecution of their business. Indeed, mechanical power is now—thanks to steam—only a question of expense, and can be had at all times and anywhere by paying for it in the shape of fuel. In this respect the manufacturer is no longer so circumscribed in his choice of a site for his operations as he was formerly. But water, abundant and good, is only to be had within limits which are fixed rather by nature than by any efforts of man; without it the woollen trade would be impossible, and, although much may be done by combination to bring water from a distance for the use of manufacturers, its cost when so supplied is a heavy tax upon the woollen industry, and places the manufacturer at a disadvantage in the market as compared with those who derive their water from natural and readily accessible sources. If at this present time and with the full advantage derivable from steam power the woollen and worsted trade was to be established for the first time in England, the West Riding of Yorkshire, with its streams of bright pure soft water, and its productive coal-fields, would be, as it has been, the chosen site of this manufacture. But as old age, decay, and death in a plant or animal is the natural result of wear and tear of the vital processes, so it would seem that the successful prosecution of woollen manufactures is certainly, if slowly, leading to their destruction or removal from their ancient and favoured haunts, if some effort be not made to arrest the progress of pollution of which they themselves are the chief cause. In the two facts, first, that in one year (1864, Table D.) 384,000,000 pounds of wool were worked up into various tissues in Great Britain, and secondly, that every pound of this wool has to undergo operations necessitating the use of large volumes of water, and rendering that water foul and offensive, we have the history of all rivers on which the woollen trade is located, and notably of the Aire and Calder.

These rivers are indeed subject in common with those flowing through agricultural districts (as the Thames and Lee) to pollution from sewage, from tanneries, breweries, malting and other ordinary trades, and from exceptional manufactures, such as paper making, &c., but beyond all doubt their characteristic peculiarity is that derived from the different processes incidental to the worsted and woollen trade. To those who are familiar with the West Riding of Yorkshire it may seem unnecessary to describe the condition of the rivers which form the subject of this report, and yet it may well be doubted whether that very familiarity may not have rendered them all but unconscious of a state of visible pollution which strikes a stranger from the non-manufacturing districts with astonishment.

Moreover it is certain that very few persons even in the district possess an intimate knowledge of the causes of this pollution or can estimate their individual influence on the general result.

With very few exceptions the streams of the West Riding of Yorkshire run with a liquid which has more the appearance of ink than of water.

In the higher part of the country as is shown, in another part of this report, the water is of the purest description, but as it arrives at any point where conditions for the establishment of a woollen mill are sufficiently favourable, so does the character of the water commence to deteriorate, becoming fouler and more foul after leaving each successive mill, till as has been abundantly shown by the evidence, the stream has to be abandoned as a source of water either for domestic supply or for manufacturing purposes, (otherwise than furnishing power) and is looked upon and treated as little better than an open drain.

In order that we may learn to what extent and by what means a state of things so baneful alike to the towns and the country, to the manufacturer and the operative, the landed proprietor and the peasant, may be remedied, it is necessary to describe

in some detail the different stages of the treatments of wool, and the dyeing and cleansing of fabrics as practised in the mills of the district.

*Wool Washing.**—The first process giving rise to pollution is that of washing the wool. The object of the washing is to remove ordinary dirt and the natural grease, as well as that which has been applied to the fleece, and to open the wool to the action of the dye.

The wool is immersed in a copper filled with stale human urine, diluted with water and heated by steam. In this bath it remains for a time varying from half an hour to two hours, when it is laid upon a grating placed over the copper to drain, and then removed to another vessel to be washed with cold water.

The action of stale urine probably depends upon the presence of free ammonia or its carbonate. Pigs' dung is sometimes employed instead of or in combination with the urine. Other substances, such as soda-ash, phosphate of soda, and salts of ammonia, are sometimes substituted or added to this bath, but the favourite material seems to be stale human urine.

The wool, after being drained, is washed in cold water. In the smaller mills this is performed by stirring up the wool in a tank of water with a strong pole, the water being let off through a "clow" or shuttle, furnished with a grating, at the bottom of the vat, which is again filled with cold water, the water being renewed several times in succession.

In late years a machine known as Petrie's wool-washing machine has been introduced. The wool, steeped as before, is here immersed in water contained in long tanks, and is made to pass forwards, being at the same time opened out by an ingenious arrangement of rakes worked by machinery. The principle in this case is to introduce the wool to liquid which is already fouled by having passed over a first portion, and so gradually to bring it into contact with clean water at the other end.

Three or four of these vessels are placed in series, and the wool is transferred from one to the other by endless bands of wire gauze.

The wool is put into a tank from which the waste water flows away, and issues from the tank to which the clean water is supplied. The use of this machine offers an opportunity of economizing water, which is of great advantage when the supply is limited, and as it appears to work effectually, its more general introduction would probably be of benefit in diminishing the quantity of foul water to be dealt with.

This "scour" water runs in either case from the vats to the nearest outfall. There is nothing in it that is considered worth saving, and we have not heard of its ever having been turned to account, or treated in any way. It will be easily conceived that the first of the "scour" is a most offensive liquid. In the case of the old, and still generally practised, method of hand-washing, the liquid differs very much at different periods of the process; the first vats let-off being very foul, whilst the last portions are nearly clean water.

In washing by machine the whole of the water will necessarily be of one character, more diluted than the first water from the old process and less so than the latter quantities, but as a whole equally objectionable.

The discharge into rivers of large quantities of water in which dirty wool has been steeped would be bad enough, even if water alone were used, but the nature of the filthy liquid which is actually employed makes it thoroughly disgusting.

The first portions of the washings are a yellowish glutinous stinking liquid, and this, as we have said, is passed into the rivers. If the wool is not to be dyed, or is to be removed from the premises for that purpose, or if it is to be woven before being dyed, it is dried in hot chambers of various constructions; but this part of the process is not productive of any nuisance or pollution.

Wool Dyeing.—The dyeing process is the second source of pollution from the woollen manufacture.

It would be out of place in this Report, even if it were practicable, to enter into a lengthened account of all the different processes of dyeing different colours as practised in the mills of the West Riding of Yorkshire, or even to enumerate the different materials which are employed. Every shade of colour, every form of fabric in woollen has its representative here, and it would require volumes of print to describe them even cursorily. One case, however, may be sufficient to illustrate the

---

* See Appendix No. VI., p. lxi.

whole, and the best to select, because the simplest and that which leads to the greatest amount of pollution, is probably that of dyeing black goods.

It should, however, be stated that two forms of dyeing are practised which respectively produce modifications of the refuse materials.

The one is the dyeing *in the wool* (whence the goods are called *wool-dyed*), the other dyeing *in the piece*, that is to say after the cloth is woven. In this latter case the goods are called *piece* (or *stuff*) *dyed*.

We shall describe the process of dyeing in the wool.

The materials used in dyeing black, omitting indigo, are several different woods, such as logwood, barwood, camwood, peachwood, fustic, and various salts, principally copperas or sulphate of iron, alum, "argol," or crude bitartrate of potash; to these must be added, as inventions of a later date, "chrome," or bichromate of potash.

Every dyer may be said to have his own particular method of treating the wool; we do not pretend to give a description which shall be absolutely true of any one case, but in general the following may be taken as an outline of logwood-dyeing, *without* chrome.

A quantity of washed wool, say 200 lbs. is put into an iron vat or cistern holding from 700 to 1,000 gallons of acid liquid made by boiling camwood and barwood with a certain quantity of "argol" and alum; by this process, which is called "souring," a certain pink colour is given to the wool, and it is prepared for subsequent treatment by logwood. After boiling for two hours the acid liquid is let off from the bottom of the cistern by a valve or tap furnished with a grating, and the wool having been removed, the vessel is again filled up with water. Bags of logwood, reduced to the condition of sawdust, are now suspended in the liquor from a pole placed across the vat so that a clear extract may be obtained. A certain quantity of alum and argol is again added. When the soluble parts of the logwood are supposed to be dissolved in the water the bags of exhausted wood are removed, and the wool, which has been "soured" by the last process, is put into the vat. The whole is now kept at the boil for two or three hours, at the end of which time the copperas, dissolved in a small quantity of water, is added. The boiling is continued for some time longer, and, the fire being withdrawn, the whole is allowed to cool down to about 100° Fahrenheit, when the valve is opened and the waste liquid allowed to flow away.

This waste liquid is the great and chief source of pollution of the rivers, so far at least as their appearance is concerned. We shall return to it presently.

The dyed wool is now removed to a heated chamber or stove, to be dried. When dried, it is beaten or "scrabbled" in a machine, through which a current of air is made to pass so as to blow away any portion of dye-material adhering to it, and short pieces of wool unfit for weaving.

It is not proposed to describe the different mechanical treatment through which the wool is passed in the manufacture of cloth, but it is necessary to state that before it can be made into yarn it requires to be softened by being abundantly greased, and for this purpose large quantities of the finest olive oil are consumed. Another point to remember is, that in the machines there is always produced a rather large quantity of waste wool, which contains a high per-centage of oil. The cloth when made is subject to two other principal processes; one being that of "milling" or "fulling," and the other of washing.

The first of these is mechanical. Its object is by beating the cloth with heavy wooden beaters to spread out the fibres and fill up the interstices of the fabric so that its texture may become close and even; hence probably the term "fulling." This part of the process is carried on in contact with water, and soap is generally, though not always, used at the same time.

The washing process consists of passing the cloth many times through soap and water, and finally through fresh portions of water until all soluble matter is removed. The soap removes from the cloth the oil employed in working it, and all that part of the dyeing materials simply adhering to and not fixed in the cloth.

We have from this point no further interest with the cloth thus manufactured, which is dried, prepared, and sent to market.

It will be seen that the stages in the manufacture of black cloth at which liquid refuse is produced are:—

1. The washing or "scouring" of the wool.
2. The discharge of waste liquid from the dye-vats.
3. The discharge of soapy and coloured liquid from the fulling and washing process.

It is necessary to a proper understanding of the subject that these operations should be considered separately in some detail.

1st. It has already been stated that the wool is washed in stale urine and water, and then washed in ordinary water till the latter runs away clear. We have not found it easy to get at the exact quantities of water used in this process.

Mr. Henry Brooke, of Bradley Mills, Huddersfield, states, that about half a ton of water is used to 50 lbs. of wool in each washing, of which there are two or more; but, he adds, "there is a great difference. Some people use much more water than others."

Some returns lately made to us on this point give such divergent quantities for the water used in washing the wool that the only conclusion at which we have been able to arrive is that in all cases these quantities are very considerable.

2nd. The discharge of liquid waste from the dye-vats.

It may be taken for granted that each of the substances named as being used in dyeing black serves some purpose,—in heightening the colour, or rendering it more permanent; but essentially the black is produced by the action of the salt of iron (copperas) on the colouring matter of the logwood.

If we take a filtered infusion of logwood, and add to it a solution of sulphate of iron, a black colour is produced, and the black matter is solid and in suspension; that this is so can be seen by allowing the mixture to stand for a few hours, when the upper layers of the liquid will be entirely free from black matter. It is of the highest importance that a right understanding should be had of this subject, for upon it depends any hope that may be entertained of purifying the rivers of Yorkshire from the dye refuse. The black dyeing of wool depends upon fixing in its pores an insoluble compound of the colouring matter of logwood with iron. When the copperas is added to the boiling logwood liquid the formation of this product takes place, both in the wool and *outside of it in the liquid;* that which is formed in the wool, being insoluble, remains in the fibre, and cannot be removed by any subsequent washing.

But by far the greater part of the black precipitate is formed in the liquor itself; and it is this, and not any portion of spent dye-woods, which constitutes the blackness of the stream issuing from mills when the dye-vats are discharged.

If a quantity of the black liquid is filtered it will be found that what remains on the filter is a compound of the vegetable matter of the dye and oxide of iron; in the solution will also be found a large quantity of the salt of iron, which is used in excess.

It is difficult to form an accurate estimate of the quantity of this black suspended matter.

The results of several experiments give the quantity in 1,000 gallons at from 50 to 150 lbs. when dry.

There can be no question, as has been before mentioned, that it is to this material that the black appearance of the rivers is chiefly due. Its discharge in enormous quantities helps to silt up the stream and the mill goits. If it could be kept out of the streams they would be *comparatively* clean.

Very few attempts have been made to cleanse the dye-water before discharge into the rivers. Mr. Ripley of Bradford describes a plan adopted at his mills for arresting a portion of the dye refuse by means of subsiding reservoirs, but as he subsequently flushes out the deposit into the stream this system is simply, so far as the river is concerned, the conversion of a daily and regular into an intermittent and periodical fouling of the stream.

Mr. Townend, of Cullingworth, speaks of having very successfully dealt with dye-water by filtration through beds of ashes; but the dyeing operations at his mill are not on a large scale, and this method would not be available at many works.

It has been stated that the black dye-water will deposit and become clear on standing; but this change is very slow, and to cleanse dye-water in this way would be difficult in some cases, without extensive subsiding reservoirs.

Experiments in the laboratory prove, however, that the precipitation of black dye-water is readily practicable by chemical means. The black liquor discharged from the dye-vats is, as before said, a solution of sulphate of iron, in which insoluble dye is suspended. The addition of a little lime neutralizes the acid of the iron salt, and produces a flocculent precipitate which carries down with it the finely divided black matter. The action is rapid and complete, and in a few minutes the liquid becomes clear and nearly colourless. The quantity of lime required for the purpose does not exceed 10 lbs. to each 1,000 gallons of dye-water. The expense is therefore incon-

siderable. By the use of properly constructed precipitating tanks it would be quite practicable to purify by this means the dye-water of the largest works. The clear liquid might be run off from the precipitated matter, and the latter, after draining, might be pumped or dug out of the tank, and set in heaps to drain.

The ready separation of the black dye-stuff from the water has appeared to us so important that we have taken into consideration every means by which it might be accomplished. The problem is the separation day by day of the solid matter in such form that it may be preserved, if of any value, or, if not worth preserving, be readily burnt or got rid of otherwise than by passing it into the rivers.

A form of mechanical filter which has been found very valuable in several manufactures early attracted our attention. It is a patented invention known as Needham's press, consisting of a number of narrow chambers lined with linen or calico, into which the liquid to be filtered is driven by a small force-pump. The liquid passes clear through the bags, whilst the solid portions are arrested. This action is maintained with low pressure until the chambers begin to be filled with solid residue, when it is necessary to increase the pressure. The machine is extensively used in the Potteries for the separation of clay from water in which it has been washed; it is also successfully adopted in papermaking, in breweries, and some other manufactures.

The thin mixture of clay and water known as "slip" was formerly dried on hot plates till it became fit for working. In many potteries the mixture is now pumped into Needham's machine under great pressure, and when the operation is complete the clay is taken out in solid cakes, which are strong enough to be readily handled and fit for the use of the potter.

By the kindness of Mr. Henry Brooke, and under the superintendence and at the expense of Mr. Needham, one of these presses was fitted up in the dye-house at Bradley Mills near Huddersfield, and experiments were made from day to day in the filtration of black dye. These trials were very satisfactory to us, as showing that it is perfectly practicable to separate from the dye-waste the most objectionable portion, and to discharge into the rivers a liquid comparatively pure.

The greater or less absence of colour in the filtered liquid depends upon the due adjustment of the lime, which is readily arrived at after a few trials. It is quite possible by this treatment to filter from the dye waste a liquid as bright and colourless as the water of ordinary rivers not contaminated by manufacturing refuse. On the occasion of a public exhibition of this process which was made at Bradley Mills in March and April 1867 samples of this water were taken, analysed, and found to contain in a gallon—

	March 27.	April 4.
Organic matter - - -	2·56	3·12
Mineral do. - - -	32·94	34·33
Total solid contents - - -	35·50	37·45
Hardness in degrees of Clarke - -	14·4	18·60

Many waters of rivers are less pure than was this sample of chemically treated dye-water.

The machine actually employed at Bradley Mills, although only about 7 feet square by 3 feet in height, had a filtering area of 240 feet, and by it we were enabled to cleanse from 700 to 1,000 gallons of limed black dye-waste in an hour. The tank in which the dye-water was precipitated was capable of holding from 2,500 to 3,000 gallons, and was calculated for the treatment of from one to two day's discharge. Mr. Brooke considered that this tank and machine would enable him to purify all the dye-refuse produced at his mill before discharge into the river. With regard to the solid material which is found in the cloths when the machine is taken to pieces, this substance is, as has been already explained, a combination of oxide of iron and vegetable matter. It is not difficult to dispose of it when taken from the press. It is similar to damp sawdust, and may be got rid of by mixing it with small coal, and burning it under the furnaces; better still is it to allow the material to dry up (which from its light porous nature it readily does), and then to set fire to it; it burns like a slow match, without flame, but so persistently that a heap once alight will burn till all the vegetable matter is consumed. There remains, after combustion, a red powder which is almost

entirely oxide of iron. It forms from $\frac{1}{5}$th to $\frac{1}{4}$th the weight of the black stuff, and would undoubtedly find a market, either to be made into red or chocolate paint for external ironwork, or to be used in the purification of gas, or for conversion into perchloride of iron for purposes of deodorization.

It is impossible at present to say to what other purpose this black solid residue from the dye-wastes might be put. From the quantity of oxide of iron which it contains, and from its porous character, it acts, we find, as an excellent deodorizer, and would probably be eminently useful in some cases where charcoal would be employed. This peculiarity can also be taken advantage of in the treatment of the putrid scour water before mentioned. It was found impossible to filter this foul liquid in its natural state through Needham's press. When, however, a quantity of the black precipitate was mixed with it, the putrid smell was removed, and the liquid filtered became bright and colourless. In practice it is easy to take advantage of this property in the treatment of the scour-water, and thus to make one source of pollution of the river the means of counteracting another. The scour-water may be even more readily purified by mixing it with the dye-water before precipitation; but this necessitates a far larger capacity of retaining tanks.

Before leaving this part of the subject, we think it right to say, that although we are convinced by our experience of black dye-water that it is perfectly practicable to purify it, and thus greatly to improve the condition of the river, we have no intention of dictating *how* this should be done. One manufacturer may choose to have large precipitating and subsiding tanks, and to run off the clear liquor; another may filter it through ashes; a third may see his advantage in using Needham's press, or some other contrivance for the same purpose. It is our duty to recommend that any purification of the river, which we believe reasonable and practicable, should be enforced, but it is no part of that duty to specify the precise way in which that purification should be accomplished.

At the same time there are many circumstances in favour of a mechanical method of filtration of these refuse liquids, such as that of Mr. Needham's press; chief amongst which are the small amount of space necessary for working, the production of a nearly dry and manageable product, and a perfect security that no liquid shall pass unfiltered into the rivers.

We have not had the opportunity of trying the action of the centrifugal machine in filtering dye-water, but it is worth consideration.

We would wish to impress upon those who have to deal with this subject the absolute necessity of *chemically treating* the dye-water before attempting to cleanse it, whether by subsidence or filtration. The black matter is so finely divided that it is all but impossible to separate it without such treatment, except after long standing; and long standing means great capacity of tanks and consequent difficulty and expense.

In addition to this, if the dye-water be not so treated a large quantity of salt of iron will escape in solution with the water.

The addition of lime need be neither troublesome nor expensive, and its use greatly simplifies the problem of treating the refuse of dye-houses.

In dealing with the refuse of black dyeing we have only treated one branch, though a very important branch of the subject. There is of course a discharge, more or less coloured, from every kind of dyeing, and the treatment must be modified accordingly.

It would be manifestly impracticable for the dyer, especially for those who are called "public dyers," that is to say, who dye goods for manufacturers, and who are therefore called upon to dye on the same day or in the same week all shades of colours, to treat the refuse from every vat separately. In this case arrangements must be made for collecting the whole of the liquids into one, and by lime or other suitable agent obtaining the best purification possible.

It is obvious that whatever difficulty or impossibility may attend the removal of *all* impurity from the refuse liquids before discharge, it is practicable and comparatively easy to arrest all suspended matter, and to keep such matter out of the river.

All the witnesses agree that it is not so much the salts dissolved in the river water that would prevent its use by them in washing and dyeing as it is the *dirt* and matter suspended in it, and which in great measure is caused by the discharge from the dyeing and washing processes.

No solid matter from dye-works should under any pretence be allowed to pass into the streams.

There will be no want of skill on the part of manufacturers or others to meet difficulties as they arise, so soon as the prohibition is made absolute.

3rd. The third stage of refuse discharge, namely, fulling and washing dyed goods, remains to be described.

After the cloth has been woven it is subjected, as has been before stated, to a process of beating, or is passed through powerful rollers, by which the fibres are flattened out; this process is called *fulling*.

The cloth is caused to pass repeatedly through vessels containing a strong solution of soap. The combined action of the beaters and the soap causes the removal of the oil which had been applied to the wool, and of those portions of the dye which have not become permanently fixed in the fibre.

Removed to another apparatus, the cloth is now washed with an abundance of water until the last portions of soapy liquid are removed.

The liquids produced are known as the "soap waters," or "soapsuds." They vary very much in character, according to the goods which have been washed, being sometimes very black, and sometimes comparatively colourless. That portion also which is discharged from the fulling machine is much thicker and fouler than the washings, and of these the first portion is the strongest, getting less and less so till the washing is complete.

Formerly, as described by several witnesses, the whole of this soap water was discharged into the rivers, and was a source of serious pollution, causing a scum and froth, and coating with slime all objects with which it came in contact.

The large quantities of soap and oil employed, however, very naturally attracted attention to the possibility of dealing with these liquids for the extraction of grease. Mr. Teall of Wakefield stated that the extraction of grease had been carried on upon a small scale for 20 years past, his own connexion with this business dating 14 years back.

There are in the principal woollen districts persons who make a business of the extraction of grease from soapsuds. Contracts are made with millowners, by which the grease-extractor secures a right to the soap liquids, in consideration either of a fixed annual payment, or of a royalty computed on the amount of grease saved, or of the quantity of soap used in the mill. In most instances the millowner gives accommodation for the carrying on of the process, and in some cases is at the expense of the necessary tanks and other plant, as well as furnishing steam where required. For the privilege of treating the soap-waste very varying sums are paid to the mill-owner, according to the extent of his operations, and consequently of the soap and oil which he uses.

We have been told of an instance in which as much as 3,000*l.* a year was received by one millowner for the concession; but this was a very exceptional case, and the amount realized is more usually from 50*l.* to 150*l.* or 200*l.* a year.

Grease Extraction.—The process of extracting grease from soapsuds is sufficiently simple, and may be described in a few words.

The soapsuds from the fulling and washing machines are allowed to flow into a tank or tanks capable of holding all that may be produced in one or more days. In some mills the whole washings are collected; but in the larger number the flow to the tank is stopped by a simple "shuttle" or valve at a given period in the process of washing; that is, when the liquid is becoming poor and so nearly approaching to clean water that the contractor does not find it worth while to collect it for treatment.

The workman having charge of the washing process usually receives from the contractor a small gratuity to induce him to attend to this. In some cases, the power of diverting the flow is at the tanks, and within the control of the contractor's own servants. The separation of the grease is effected by the addition to the soapsuds of an acid which neutralizes its alkaline character and liberates the oily acids. Sulphuric acid is usually employed for this purpose, as being most economical, but hydrochloric acid is equally effective. The quantity of acid varies according to the material to be operated upon, but as its use constitutes a considerable proportion of the expense, it may be supposed that the grease extractor is careful to avoid any unnecessary excess.

In the majority of works the liquids are treated cold, but steam is sometimes employed, under a patent process for hastening the separation of the grease.

The addition of the acid causes a change in the appearance of the soap liquid; a portion of solid matter rises to the surface, but a quantity falls as sediment to the bottom of the tank. When the separation is considered complete, the water is run off from an opening in the tank near the bottom, but above the sediment, until the greasy matter floating on the top joins the sediment. This water flows away by the ordinary drainage channels of the mill to the rivers.

The semi-solid contents of the tanks are now taken out and placed to drain in large open bags made of cocoa-nut fibre lined with coarse canvas, and here an additional quantity of water is removed; in some cases the greasy matter is mixed with sawdust to render it portable.

The drained greasy mass is further subjected to a process of pressure and heat, which results in a crude oil, which flows into barrels, a solid cake remaining in the press. The oil is distilled for the production of refined oil, stearine, &c., with which we have no concern, and the cake is sold to manure manufacturers. In Appendix No. VI., page 62, will be found the returns made to questions which were addressed to some of the principal woollen and worsted manufacturers in the West Riding on this and other similar subjects; the following table compiled from such of the answers as could be made available* will give some idea of the value of oil and soap used by the trade, and of the royalty paid for the privilege of recovering the grease.

From this table we learn that 17 manufacturers employ in the aggregate oil to the value of 40,000*l.*, and soap, 12,000*l.*, together 52,000*l.*; and that the amount received from the contractors for liberty to recover the grease is about 1,000*l.*, or *two per cent.* This calculation is not strictly correct, because in three of the cases no amount is paid, the grease not being extracted, but it is sufficiently so for all practical purposes.

The sums received by the manufacturers are indeed hardly worth consideration, and in some cases the cost of steam and of plant and working space has to be deducted.

As this trade of grease extraction is not confined to one firm, but is practised by many persons throughout the district, it would appear that the payments in question are the fair market value of the privilege, and that the profits are not of a nature to afford larger royalties to the manufacturer. If this be so, if the grease extractors do not realize excessive profits, what becomes of the large value which is put into the wool in the shape of actual oil and the grease in the soap?

The settlement of this question is of no slight importance: if it can be shown that the process for separation of grease is carried on in a slovenly and wasteful manner, that a large proportion of the grease is lost or injured, and that the refuse liquid which results from it is not nearly so cleansed as to satisfy the requirements of river purification, and if, further, improvements can be suggested which would be attended with greater pecuniary results as well as greater purification, it is obvious that there would be no injustice in calling upon manufacturers to adopt them.

We shall therefore as briefly as possible endeavour to trace the large sums spent in oil and soap, and see what becomes of them. For this purpose we shall select the return of Messrs. David Yewdall and Sons, Calverley Grange, Leeds.

This firm consumes annually 1,500,000 lbs. weight of wool, all of which is washed. In washing this wool they employ 28,000 lbs. of alkali and 12,000 gallons of human urine, besides a much larger quantity of urine in scouring the cloth subsequently; but our business is not now with either of these substances.

* Some of the returns are not fully made, and others are from manufacturers who do not use the ingredients we are here treating of.

In working the wool they use Gallipoli and other olive oils to the extent of 3,500*l.* which sum would represent about 58 tons of such oils.

In carding the wool 64,000 lbs. of waste is produced, which is sold to the waste dealers, who probably extract the oil and sell the residue as manure.

The goods are then washed at a cost of 1,000*l.* in soap, which amount would probably represent 33 tons of soap (at 30*l.* a ton), containing at a low estimate 11 tons (at 33 per cent.) of grease.

If the whole of the oil used and the grease of the soap were to be found in the soapsuds, it would simply rest with the skill of the extractor to recover them, but this is not quite so. In the process of carding a quantity of short wool is produced and separated.

This, which contains a large proportion of oil, is, as before stated, sold to the "waste" dealers. Messrs. Yewdall return 64,000 lbs. on 1,500,000 lbs. of wool, or 4½ per cent., as their annual waste. Three samples were furnished for analysis by Messrs. Yewdall as representing three different qualities of this waste. When examined in the usual way they were found to contain of oil and fatty matter by weight—

No. 1.	No. 2.	No. 3.
30·53 per cent.	39·58 per cent.	43·15 per cent.

Quite recently we received three other samples of wool waste from Messrs. Yewdall who at the same time gave approximately the proportion in which these several kinds of waste were produced in their mill. The following table give these data together with the oil in the whole waste.

No.	lbs.	Oil per cent.	Total oil.
1	14·000	42·15	5,901 lbs.
2	20·000	30·79	6,158 „
3	30·000	33·05	9,915 „
			21,974

The whole quantity of waste (64,000 lbs.) contains 21,974 lbs. of oil, or 34·3 per cent.

Taking 35 per cent. as fairly representing the quantity of oily matter in the whole of the waste produced in Messrs. Yewdall's works, we find that the 64,000 lbs. of waste wool produced in the year would carry away with it 22,400 lbs. of oil or exactly 10 tons.

A further, but comparatively small quantity, of oil is accounted for as being left in the manufactured cloths as sold from the warehouses, and therefore out of the reach of the grease extractors.

The following determinations of oil in pieces of new cloth of different colours obtained from a tailor afford data for calculating the amount for which allowance is to be made under this head.

	Per cent.		Per cent.
Blue	1·27	Scarlet	1·14
Ditto	0·66	Dark Brown	0·60
Black	0·77	Chocolate	0·57
Ditto	4·32	Drab	0·56

or an average of 0·73 per cent.

Messrs. Yewdall of Leeds, also kindly furnished 18 samples of cloth, each one of a different shade of colour.

It was not thought necessary to examine these separately, but an equal weight of each was taken and the mixed sample when analyzed gave 0·76 per cent. as the proportion of oil present.

We may safely therefore consider that cloth on an average contains something like 0·75 per cent., or 7½lbs. of oil to each 1,000 lbs. of cloth.

From statements made to us during our inquiry, it may be assumed that the weight of cloth is about half of that of the original wool used. We require therefore, to add to the quantity of oil removed in the wool waste a further amount equal to 3¾ lbs. for every 1,000 lbs. of wool used. Messrs. Yewdall use 1,500,000 lbs. of wool, and the 750,000 lbs. of cloth which they send to market must carry with it 2½ tons of oil.

If, then, from 69 tons of oil and grease employed by Messrs. Yewdall (58 tons as olive oil and 11 tons in the soap used) we deduct 12½ tons as the quantity removed in the waste and in the manufactured cloth, we still have 56½ tons falling under the control of the grease extractor in the soapsuds. It rests with him to carry on his business in such a way as to recover a reasonable proportion of this grease. If he does so recover a fair proportion of this valuable material, and if the expense of the manufacture be not very great, the profits must be excessive. If, on the other hand,

as we before suggested, the amount paid in royalties for the privilege of extraction is the fair market price of that privilege, and leaves only a sufficient margin for reasonable profit to the contractor, we must infer that his business is carried on in a very unsatisfactory manner, and is open to great improvements. In the particular case quoted we are unable to follow the matter further. We know that the yearly soapsuds of Messrs. Yewdall and Sons must contain nearly 60 tons of oily matter, and we know that the contractor pays to the firm 75*l.* a year for the opportunity of extracting as much of this grease as he thinks desirable. We have clear evidence that the oil extracted is worth 18*l.* or 20*l.* a ton. Supposing, therefore, that 50 out of these 60 tons were extracted, a sum of 900*l.* to 1,000*l.* would be applicable to meet costs of acid, labour, cartage, wear and tear of presses, &c., and profit upon operation. We shall immediately show that the grease extractor does not recover anything like the quantity of grease from the soapsuds which he might do, and that in a subsequent part of the operation he loses a further large proportion of that which he has separated.

Before proceeding to offer further instances of this kind it is necessary that we should state that the proportion of *waste* produced in combing and carding wool differs very greatly in different mills as shewn by the following table.

——	Wool lbs.	Waste.	Percentage.
Akroyd, James & Sons	343,000	15,000	23·8
Armitage Bros.	347,000	62,400	18·0

It will be seen that the proportion of *waste* varies from 3 per cent. up to 33 per cent. depending no doubt in a great measure upon the quality of the wool and the nature of the fabric made. A knowledge of the proportion of *waste* is of importance to our present purpose, inasmuch as we seek to ascertain the quantity of oil in the soapsuds by the difference between that which is actually used, and that carried off in the *waste*, and the cloth.

In the following table, which extends the illustration given in the case of Messrs. Yewdall to a number of returns, we have calculated the oil in the *waste* at 35 per cent. in all cases, but it is probable that by so doing we have largely *over*-rated the oil removed, and consequently *under*-rated the quantity left in the soapsuds.

——	Oil at 60*l.*	Soap at 30*l.*	Oil in Soap at 33 per cent.	Total Oil.	Oil in Wool Waste at 35 per cent.	Oil in Cloth.	Oil in Waste and Cloth.	Oil in Soap-suds.	Value of Oil in Soapsuds at 18*l.* a Ton.	Royalty paid.

Total	513	342	125¼	627¼	178½	21½	200¼	427	7,686 0	895

We learn that of 627 tons of oil and grease (in soap) used in thirteen mills 200 tons leave the works and warehouses in the waste wool and cloth, and 427 tons pass away in the suds. The value of this oil at 18*l.* a ton, deducting Messrs. Akroyd and Mr. Bates, whose suds are not treated, is 7,600*l.*, whilst the price which the contractors find it worth their while to give is 895*l.*, or 12 per cent.

We shall now endeavour to show how the great discrepancy in these figures is to be explained.

We have in a previous part of this Report described the method of treating the soapsuds, &c.

The quantity of acid employed will differ according to the greater or less richness of the soap water, but the following will give a fair idea of it. The Commissioners visited Mr. Lister's works at Halifax, and had an opportunity of seeing the acid added to a tank of soapsuds. The experiment was not made expressly, but came in the ordinary course of treatment.

To 3,600 cubic feet, or 22,500 gallons of soapsuds, three carboys of "brown acid" were added. This quantity of brown acid would weigh about 4 cwt., and would cost 15*s.* or 16*s.*

A sample of the liquid was taken for analysis, and was found to contain 653·4 grains of grease per gallon. According to this the whole quantity of grease in the tank was 2,350 lbs., or somewhat above a ton. To separate a ton of grease from soapsuds would therefore cost less (supposing the whole grease to be recovered) than 1*l.*, so far as the acid was concerned.

The water which is allowed to flow away from the tanks is more or less improved by the treatment to which it is subjected.

In answer to the question "Does the water from the grease process pass away clear or how nearly so?" Mr. Wormald makes no return; Messrs. Crosland say "Very dirty;" Messrs. Brooke say, "Not nearly clear at all;" Messrs. Barker say, "Nearly clear;" Messrs. Yewdall, "Very nearly;" Messrs. Armitage, "Not quite clear;" Messrs. Howgate, "Very clear," and so on.

Our own experience is not in favour of the success of this method of clearing the water. It has not been our fortune to see any instance of this process being carried out with the result of "very clear" effluent water. On the contrary, in the examples which we have seen the appearance of the liquid has not been sensibly affected by the treatment, and the water has escaped foul and objectionable.

When the liquid passes away foul and uncleansed we may take it for granted that grease is being wasted.

The following are analyses of samples of soapsuds and of refuse water from their treatment :—

—	Messrs. Rouse and Co's Mill at Bradford Wool-washing.	Soapsuds from Messrs. James Brooke & Son.	Mr. Lister's, Halifax.	Refuse Water from Grease Works.	
				Messrs. Hamilton's, Bradford.	Messrs. J. Smith & Co., Bradford.
Solid residue grains in a gallon -	758·94	540·40	1,246·0	506·5	314·72
Fatty matter - - -	518·7	266·20	653·4	117·0	67·9
Other organic matters - -	17·5	Not	—	189·1	90·3
Mineral matter - - -	222·7	ascertained.	—	200·34	155·5

The two end columns show that grease, amounting in the one case to 68·9 grains, and in the other to 117 grains per gallon, are wasted in the cases quoted, but the table does not afford the means of calculating the proportion of the whole so lost.

By the kindness of Mr. Seed of Huddersfield we are enabled to supply this deficiency. Mr. Seed sent to the laboratory of the Commission for analysis samples from different mills where he separates grease from soap-waters. In each case a sample was taken from the tank of the soap-liquid when full and ready for addition of acid, and another sample of the liquid as discharged. The following Table shows the general character of these samples, the words "before" and "after" meaning before and after treatment for separation of grease :—

	Mineral. Grains per Gallon.		Organic. Grains per Gallon.		Total. Grains per Gallon.		Grease. Grains per Gallon.		Grease separated.	Percentage of grease separated.	Percentage of grease lost.
	Before.	After.	Before.	After.	Before.	After.	Before.	After.			
Greenwood & Hansons	530·32	304·50	1204·21	282·80	1734·53	587·3	1099·56	193·76	905·8	82·4	17·6
Broadbent - -	103·27	223·30	261·43	284·62	364·70	507·92	220·64	176·96	43·68	19·8	80·2
Schofield - -	122·50	220·85	430·36	318·71	552·86	539·56	365·23	61·60	303·63	83·4	16·6
Mellor - - - -	215·25	243·25	906·85	791·35	1122·10	1034·6	790·20	393·85	396·35	50·2	49·8
Shaw - - -	82·32	185·5	436·24	387·80	518·56	573·3	397·74	271·74	126·00	31·8	68·2

The two last columns show the percentage of grease recovered and lost. In no case is more than 83 per cent. of the grease obtained, which, however, is a fair success; but on the other hand, in one instance, half the grease is lost, in another nearly 70 per cent., and in another 80 per cent.

We have no reason to believe that Mr. Seed is less successful in the treatment of the soapsuds than other contractors, although it is probable that where heat is employed the separation is more effectual, and the inference is plain that the grease process, as practised, does not recover half the oily matter present in the soapsuds, and which might be recovered by a more perfect process.

But the loss of material suffered by the grease contractor does not end with the acidifying process. We have mentioned that the "magma," or thick greasy extract from the soap waters is carted from the mills to the premises of the contractor, where the oil is separated from the dirt. For this purpose coarse cloths are filled in a frame with perhaps 10 or 15 lbs. of the material, and are then placed one above the other with intervening sheets of iron in a screw press. This press is in the form of a cupboard, with a door closing the front. When the press is charged steam is thrown into it; the screw which works by a handle above and outside the case is turned from time to time till the oil ceases to flow. When this period is reached, the press is opened and the cloths containing the residue in the form of cakes are removed.

We have not the data for calculating what weight of this residual cake is produced in relation to a given quantity of oil, but it is certainly very considerable—heaps of the material of a great many tons in weight will be seen lying on the premises of the grease contractor. Samples of this cake have been examined to ascertain how much fatty matter was left after the action of the press.

The following is the result of such examination of three samples from Mr. Seed:—

	Per cent.
No. 1 fatty matter - - - - - -	28·89
No. 2 ,, - - - - -	17·16
No. 3 ,, - - - - -	18·01

Mr. Seed employs sawdust to help to dry up and render portable the greasy matter left in the precipitating tanks after the water has been run off. This sawdust would of course retain a good deal of the oil which would otherwise be separated from the cake by pressure, but under any circumstances this method of extracting could never remove the whole of the oil.

The cake is sold for manure, and is said to be very fertilizing. The following general analysis of a sample of it may not be without interest:

Moisture - - - - -	24·42
Fatty matter - - - - -	17·16
Other organic matter - - - -	42·86
Mineral matter - - - - -	15·56
	100·00

The organic matter contains nitrogen 3·34 equal to ammonia 4·0 per cent. of the cake. It is probable that to this nitrogen is chiefly to be ascribed the fertilizing action of the cake, and that the removal of the oil would not diminish its agricultural value. The mineral matter is principally mud and dirt of no value as manure.

The oil which flows from the presses is thick and nearly black; it is we understand usually sold by the smaller grease contractors to firms like Messrs. Teall Lepaige

and Co., of Wakefield, who distil it and obtain light coloured oils, stearine, &c. in a fit state for the market.

It must not be forgotten that the oil which is used in the manufacture of the cloth is bright nearly colourless olive oil, worth 60*l.* a ton, and that the grease which is recovered is black and turbid and worth less than 20*l.* a ton. Here in itself is a loss equal to two-thirds of all the money which is spent upon oil and soap in the West Riding of Yorkshire. It is probable that discolouration of the oil is to a certain extent due to the colouring matters of the dye stuffs, and is not preventible, but we incline to the opinion that some part of the injury is caused by the sulphuric acid aided by heat in the process of pressing.

Having shown that the grease extraction as at present practised is unsatisfactory in the extreme, we would beg to offer some suggestions for its improvement, founded on scientific and practical knowledge of the subject, which may have the double advantage of effecting important economies and of purifying the soap water before discharge into the rivers. It will be understood that there are in the soapsuds two forms of oil or grease; the oily matter united with alkali to form soap, and the free or uncombined oil which has been put to the wool and is removed in the fulling and washing process. Part of this oil may be combined in the washing process with soap, but the greater part is really present as oil in a high state of subdivision, similar to what doctors call an "emulsion." However this may be it will be evident that the addition of sulphuric acid has for its object the decomposition of the soap which occurs by the union of the acid with the potash or soda of the soap, and the separation of the oily acids from their combination with the alkali. After treatment with the acid we have therefore no longer any soap present; instead of it we have sulphate of soda or potash (according as hard or soft soap has been used) and the fatty matter both of the soap and the oil liberated. The fatty matter of this soap being lighter than water rises to the surface, carrying with it some of the oil which is distributed through the liquid. In the cold liquid this action would be anything but perfect, and we can readily understand how great advantage is gained by the employment of heat introduced and patented by Messrs. Teall & Co.

But the action of acid is not the only method by which this decomposition of the soap and separation of the grease could be effected; for the soda of the soap it is possible to substitute other bases, such as lime or oxide of iron, and the lime or iron soap so produced is insoluble. We believe that lime has been proposed, if not used, as a means of treating the soapsuds, but we have not heard that salts of iron have been thought of. If lime were employed it would be in the state of burnt lime, made into a thin paste with water, known as "milk of lime." We have made repeated trials of lime in the laboratory, and can speak very favourably of its action. When added judiciously and without excess, it causes a ready separation of the soapsuds into clot and clear liquid, and the action is greatly aided by the addition of a small quantity of alum. One of the witnesses at Huddersfield (Mr. Seed) spoke of alum having been used in conjunction with acid, but this would obviously be an improper employment of it, as the clearing action would depend upon the neutralization of its acid by an alkali.

The "magma" separated from the soapsuds by lime would not be greasy; it would be, as we before said, an insoluble soap. The liquid flowing away would be *alkaline* from free *soda*, not acid as it is by the present method; indeed the rivers would be doubly benefited by the discharge of clear instead of foul liquid, and soft water instead of water laden with salts. The insoluble lime compound would require to be decomposed by acid subsequently, but this would be done by the extractor at his works, and under favourable circumstances, and the sulphate of lime produced would not need to pass to the rivers.

The use of salts of iron for cleansing the soapsuds might prove equally beneficial. Perchloride of iron in solution, added to the soap waters, produces a ready separation of the fatty matters and a clear liquor for discharge. Sulphate of iron or "green copperas," which is largely used in the dyeing of black goods, is also available for this purpose. The iron-soap produced would be subsequently decomposed by sulphuric acid and the iron recovered as sulphate of iron for further use.

It might indeed be practicable, where black dyeing is carried on, to employ the dye water as a means of coagulating the soapsuds and separating the oil and grease, or if this should not answer, on account of the solid black matter of the dye interfering with the subsequent extraction of the oil, or injuring it in any way, the liquid of the dye waste filtered without the addition of lime, and therefore containing as we have shown much sulphate of iron in solution, might be employed with advantage.

So far we have mentioned some of the chemical agents by which the soap liquids

may be treated. No doubt others may be found equally efficacious and will commend themselves for employment in particular circumstances. Then as to the system of discharging the liquid after the addition of the acid or other chemical agent; at present the great bulk of the liquid is run off without filtration, and it is only the thick stuff from the bottom of the tanks which is thrown on a coarse filter as before described and that not in all cases. But it is worthy of note that where this method of drainage is practised, the water runs away bright and comparatively unobjectionable. Of this fact we have proof in repeated personal observation as well as in the evidence of witnesses. What then is to prevent the *whole* liquid being made to pass through a filter before discharge into the streams? And might not some mechanical arrangement, such as the press of Mr. Needham, be advantageously used for this purpose? There is still another point to which the grease collector's attention should be directed, namely, the ultimate separation of the crude oil from the mass collected from the tanks. We have before stated that much of the colour and thickness of the expressed oil is due to the action of sulphuric acid in the process. Where the suds are treated cold it is probable that this injury occurs in great part in the press, which is heated by steam. To remedy this the greasy mass should previously be abundantly washed with water just warm enough to melt it; in this way the last portions of acid would be removed. Where steam is used to heat the soap water during the acidifying process, some small part of the mischief may occur at this point, and the employment of muriatic instead of sulphuric acid, would be preferable.

But it is questionable whether this system of expression of the oil is in any form the proper one to be adopted. We have shown that even after he has been at the expense of separating the greasy material, the extractor sacrifices a large but as yet undetermined proportion of his product in the grease-cake which is the residue from the press, and although this cake is sold for manure, at say 2*l.* or 3*l.* per ton, it is clear that no adequate return is thus obtained for the 20 or 30 per cent. of oil which it contains, and which would be worth 18*l.* a ton if recovered.

We would here suggest the possibility of employing bisulphide of carbon to extract the oil from this cake, or, better still, to extract the oil from the whole material without use of the press.

The use of this substance is sufficiently familiar to those persons in Yorkshire and elsewhere who are engaged in the recovery of oil from waste wool, and we do not see why it should be inapplicable to the purpose in hand.

With whatever results its employment in the case of waste wool may have been attended, and of this we are not in a position to speak, we learn that in France it is most successfully used in the very case for which it is now suggested, that is to say, in the recovery of grease from soap used in washing silk.

It is stated that "very large quantities of the sulphuret of carbon, the price of which "has fallen from one guinea per lb., which it was in 1847, to about three halfpence "per lb. for which it can at present be obtained, are used in France for this purpose. "Upwards of 50,000 tons of soap used in the silk manufacture were formerly "allowed to pass off to waste into the Rhone; most of this is now recovered to be "again employed in manufacture." It will of course be understood that it is the grease of this soap, and not the soap itself, which is so recovered.

There surely can be no reason either in the price of the chemical agent used or in other conditions peculiar to the case before us, why a similar process should not be introduced with advantage in the woollen districts of this country.

Before quitting the subject of this grease recovery a few general remarks may not be out of place. It has been shown, though perhaps less forcibly than it might have been by further experiments, that the treatment of the soap waters is far from satisfactory either as a measure of economy or as a means of preventing pollution of the rivers at present suffering from the woollen manufacture. Whatever may be the failing of the line of argument we have adopted, we certainly have not erred in the direction of excess in estimating the amount and value of material which *might be* but at present *is not* recovered from the water with which the goods are washed, and which is now wasted to the great detriment of the neighbouring streams.

The table (page 30) shows that 17 manufacturers dealing in the aggregate with 16,500,000 lbs. of wool use oil to the value of 40,000*l.* and soap 12,000*l.*, together 52,000*l.* a year or at the rate of 3,000*l.* sterling for each million lbs. of wool.

Adopting this figure and applying it in a calculation of the cost of oil and soap used in the whole woollen and worsted manufacture of Great Britain, we have the following startling results. Mr. Behrens gives as the total wool worked, 384,000,000 of lbs., which at 3,000*l.* of oil and soap for each million, gives 1,152,000*l.* as the consumption

of these materials in the wool trade; and taking the West Riding at two-thirds of the entire trade at least 750,000*l.* or 800,000*l.* may be set down as annually spent on these items in that district. Mr. Teall in his evidence speaks of 100,000*l.* worth of grease actually recovered and an equal amount recoverable in Yorkshire, but his estimate is obviously too modest; it is fair to say, however, that this gentleman did not include the small mills, at which, in his opinion, it would not be worth while to adopt any process of recovery; and of the 3,000 odd mills* distributed through the valleys of the Aire and Calder, a great proportion are, no doubt, on a comparatively small scale.

This Commission cannot, however, be expected to view the matter with the eyes or from the point of view of grease contractors. We have no quarrel with these gentlemen, and no intention to say one word in their disparagement collectively or as individuals, but our duty is with the rivers. Small mills which may not be worth the contractor's attention are probably in the agregate guilty of more pollution than the larger ones. It is with the owners and occupiers of mills great and small that the responsibility of discharging foul liquid rests, and the public will naturally look to them and not to their agents for redress.

The entire question of dealing with the soap waste must be met on the part of manufacturers in an earnest and intelligent spirit, and we do not doubt that, with the appliances which science offers, and of which the millowners of Yorkshire have shown themselves well able to take advantage in other respects, so large an economy may be secured that abundant funds will be forthcoming to deal with the other causes of pollution, such as dye and scour water, till such time as these in their turn become, as they surely will, a source of profit instead of a nuisance and a disgrace.

Tanneries.—In our first report we called attention to the necessity of preventing the pollution of the river Thames by the refuse of tanyards, and in the subsequent legislation by Parliament for the better conservancy of the river this question was included; but tanning on the Thames or on other rivers is unimportant as compared to that of which we received evidence at Leeds. Mr. Nickols, proprietor of the Joppa and Bramley tanyards, stated, as the result of information furnished at a meeting of the principal members of the trade, that as many as 2,750,000 hides were annually converted into leather in Leeds and the neighbourhood. The greater bulk of these hides were foreign—chiefly East Indian. These hides are, before shipment for this country, highly salted to prevent putrefaction, and before they can be subjected to the ordinary tanning process this salt must be removed. Hence arises an additional form of pollution requiring special notice.

It is not necessary that we should enter again at any length on this subject. The process of tanning at Leeds (with the exception just mentioned) does not in any respect differ from that usually practised, but the magnitude of the local trade, and the extensive pollution consequent upon it, demand some short notice.

At the Joppa tannery in Leeds Mr. Nickols tans about 12,000 skins of all kinds per week, and he uses 120,000 gallons of water in the same time; but a large portion of this quantity is consumed in the washing of sheepskins, of which 4,000 or 5,000 pass through the works every week. The water from the sheepskins is very foul and dirty; it runs direct into the river.

To remove the salt from East Indian hides, 100 or 120 of them are put into a tank with from 700 to 1,000 gallons of water; after soaking for a day or two, the brine produced is run off, and fresh water is let into the tank several times in succession until the salt is washed out.

A sample of the first soaking was analysed, with the following results:

Total solid residue in an imperial gallon -	692 grains.
Containing organic matter - - -	74 „
„ common salt - - -	549 „

The organic matter contained nitrogen 13·66 grains per gallon.

It is here seen that each gallon of water has dissolved from the hides 550 grains of salt, and 1,000 gallons would at the same rate contain about 80lbs. of salt. Mr. Nickols stated that about 4lbs. of salt is required in salting a hide, in which case a very large portion must remain to be removed by the subsequent washing.

Taking the quantity of salt as determined by this analysis at about 1lb. per hide, which is only one-fourth that which is said to be used in salting, we have an enormous quantity discharged into the river in the course of the year.

* See Appendix No. X. p. lxxxi.

Before discussing the question of disposal of this salt liquid, a few words may be said in regard to the other waste matters of the tanneries. Before the hides or skins, whether English or foreign, can be converted into leather, it is necessary to remove the hair. For this purpose they are soaked in tanks with a mixture of lime and water to swell the skin and loosen the hair, which is subsequently scraped off.

From the evidence before quoted we learn that the water is never run off from these pits; but once or twice in the week water is added to make up for that brought out by the skins, which is considerable. The lime itself, when exhausted, is dug out from time to time and carted away for manure.

Now, although this lime liquor is not absolutely run out into the drains or the river, it is certain that little by little it is brought out with the skins on to the pavement on which the hides are scraped, and thus finds its way to these outlets. And it is not only the liquid which is so removed, but a large quantity of the solid matter which is necessarily stirred up by the removal of the hides.

A sample taken from one of these tanks gave the following results upon analysis:

Total solid residue per gallon	2,016	grains.
Containing organic matter	748	„
„ hydrate of lime	358	„
„ carbonate of lime	119	„

The organic matter contained 147½ grains of nitrogen.

The hair scraped from the hides is sold to the carpet and cheap blanket ("for workhouses") manufacturers, and the very short hair for manure; the fatty matter and skin go to the glue makers.

The hides and skins prepared by the two previous processes are converted into leather by being brought in contact with a variety of substances, which we need not enumerate.

The liquid in these tanks is very valuable, and every care is taken to prevent its being wasted; very little, therefore, finds its way to the river, except upon the rare occasion when the tanks are emptied. The spent bark and solid waste from other tanning materials is usually burned or otherwise disposed of without recourse to the rivers.

The following is an analysis of the liquid running from a spent tanpit at Bramley Hall, near Leeds:

Total solid residue per gallon	1,442	grains.
Organic matter	916	„
Chloride of sodium (common salt)	54	„

The organic matter contained 10½ grains of nitrogen.

Very few words need be said about the disposal of these three forms of refuse. Outside the tanning community itself, from whom we have no right to ask an unfavourable verdict, there can be but one opinion, which is that the refuse matters from a tanyard are disgusting in a high degree, and should on no account be allowed to pass into rivers.

On the other hand, their composition is favourable to the expectation that they would be very beneficial to growing crops.

Mr. Nickols, to whom we are indebted for much valuable information, has (amongst others) shown the practical use of these liquids in agriculture by experiments on his own land. The chief difficulty Mr. Nickols experienced was that he had not land enough for the proper distribution of the whole refuse liquid of his tanyard, and that the liquid from the hide-soaking tank was too strong. It is readily conceivable that a quantity of salt so great as that shown by the analysis would be destructive to vegetation unless the liquid were largely diluted.

In Leeds, and other similar towns, the disposal of the refuse of tanyards will naturally be into the sewers, and so on to land; and when this cannot be accomplished, arrangements must be made for its direct application after sufficient dilution.

Mr. Nickols told the Commissioners that if the tanners of Leeds were deprived of an outlet for their refuse waters, "it would shut up the entire trade, and throw perhaps 20,000 people out of bread."

Such a contingency we cannot, of course, contemplate for an instant; but we believe that the pollution of the river, which is undoubtedly very considerable, from tanning refuse may be prevented without injury to this very important industry.

Ochrey Water.—The water flowing from old coal-workings frequently contains much iron, which is extremely injurious to manufactures when it is brought down in any quantity to the mills.

Evidence was given at Huddersfield of mischief to the extent of thousands of pounds caused by a sudden influx of such water into the Colne and the Holme. This "ochrey" water contains oxide of iron in a soluble state, but the solution rapidly changes by exposure to air, and the iron is deposited as a yellow mud precisely similar to that which is formed from ordinary chalybeate waters and in the little streams flowing from peaty ground (as at the bottom of the embankment of the Redbrook reservoir at Standedge, near Huddersfield). To get rid of this iron nothing more is necessary than to cause the water escaping from the old coal-workings to traverse shallow pools or canals (made tortuous, if necessary, to economize space), so that the current may be arrested and the water freely exposed to the air. In these circumstances rapid and complete separation of the oxide of iron takes place; and this, when dug out from time to time, and allowed to dry, would find a market, and probably more than pay for the small expense incurred in arresting it from passing into the rivers to their injury for manufacturing purposes.

Special Condition of principal Towns visited.

The following remarks are the substance of our observation of the individual condition of the towns we visited and the pollutions caused by them to the rivers on which they stand. Skipton is the town situated highest on the river Aire. The population is about 5,000; the rateable value about 9,000*l*. There is a local Board of Health, and waterworks for the supply of the inhabitants. The district is partially sewered and drained. Out of 1,100 houses some 300 have waterclosets; in all other cases there are privies and cesspits. At some of the factories the excreta of the workpeople is intercepted and is regularly carted away to the land. The town sewage is discharged into a stream, the dry weather volume of subsoil water and sewage being about 200,000 gallons per day; mixed and diluted in Ellar Beck with three or four times this volume of water, the whole falls into the river Aire. Cesspits are emptied from time to time, and the refuse is removed to the land for agricultural uses. Dyeworks, slaughterhouses, tan and lime works, paper mills, and the factories in the district, all discharge the fluid refuse produced into the nearest water-course, sewer, or drain, so that the volume flows into and down the river. There are water-wheels on the "*becks*" and small reservoirs or "*dams*" connected with the cotton factories. The sewage in dry weather is the cause of great nuisance at the water-wheels, and the foul sediment in the dams when flushed out "stinks awful." River improvements have been carried out near Skipton, which are fully described in the evidence, by Mr. Fenwick of Leeds.

Keighley is situate below Skipton and Bingley, on the "*North Beck*," which falls into the river Aire. There is a local Board of Health, and there are public waterworks. The population of Keighley is about 20,000. It has grown rapidly and is increasing, manufactories having recently been extended here. The principal business was worsted spinning and manufacturing; now there is a considerable trade in machine-making, such as spinning machinery for worsted, power looms, washing machines, castings in iron, and tool manufacture. There are 57 mills, large and small, on North Beck, Sladen Beck, Bridgehouse Beck, and the Worth paper mill power has been largely increased of late, and is at this time being further increased. The town has been partially sewered and drained, the fluid refuse flowing into the Worth and Aire. Until recently, solid refuse and furnace ashes from steam boilers were thrown into the natural water-courses flowing through the town, and were consequently swept down the river Aire. The sewage in dry weather is the cause of great nuisance at the water-wheels, and the workmen have frequently been obliged to leave the mills sick.

The amount of solids thrown into the North Beck and the Worth, such as material excavated from foundations, road scrapings, ashes from steam boilers, and other solids, has raised the beds of the streams within 30 years from three to four feet, choking the outlets of drains and sewers, and causing injurious floodings to adjoining lands. Gravel and sand are occasionally washed down by floods, which also tend to raise the bed of the river. Since the establishment of a local Board of Health, throwing ashes and other solids into the streams has been forbidden, but the law is evaded by many and openly defied by some; soapsuds are allowed to flow into the river, which in summer ferment and give off large volumes of foul gases. Local disease is imputed to this form of pollution.

Bingley is situate on the river Aire about four miles below Keighley, the town containing about 6,000 inhabitants; the parish about 10,000. The town is governed under the powers of a private Act of Parliament by Commissioners having a property qualification. There are 30 at present. Elections of commissioners do not take place

by the ratepayers. Harden Beck flows through a portion of the town into the river Aire. Solids are thrown into the beck and into the river by the inhabitants. Refuse from mills and factories, as also sewage, flows in. Most of the sewage goes direct into the river Aire. There are privies and cesspits to most of the houses; waterclosets are exceptional.

Bradford is an ancient town, situated on a "beck," about four miles south of the river Aire, into which the water of this beck falls near Shipley. Bradford Beck flows down through the centre of the town. The area of the watershed at the lower part of the borough boundary is about 11,000 acres, and at its junction with the river Aire at Shipley the drainage area is 14,660 acres. The borough was incorporated 9th June 1847, and in 1841 contained a population of 66,000; in 1851, 103,000; in 1861, 106,000. The township of Bradford in 1801 contained a population of 6,393; in 1811, 7,767; in 1821, 13,064; in 1831, 23,223; in 1841, 34,560; in 1851, 52,493; in 1861, 48,646. During the time the population seemed to retrograde local trade was largely increasing, as is shown by returns made to the Board of Trade. Bradford is the centre of the worsted district, and, according to the returns of exports from that district, the value of the goods was, in the year 1862, about 9,750,000*l.*; in 1863, 13,250,000*l.*; in 1864, 16,250,000*l.*; in 1865, 18,750,000*l.*; and in 1866 they possibly reached 20,000,000*l.*, so rapidly is the trade of the district increasing, owing to the introduction of improved machinery, so that the producing power of the manufacturers has increased more rapidly than the population. The contamination of the streams has increased rather according to the growth of the trade than with the increase of local population. There is increased pollution from dyeworks, from soapsuds, and from refuse of various kinds produced in manufactures. The whole of the sewage of Bradford, and of the populous district above the town flows into the beck, producing an indescribable state of pollution. It has become a Yorkshire proverb of comparison for any foul stream to say of it that it is as polluted as Bradford Beck. At the time of our inquiry Bradford Beck was the source of supply to the Bradford Canal, the fluid in which became so corrupt in summer that large volumes of inflammable gases were given off, and although it has usually been considered an impossible feat to "set the River Thames on fire" it was found practicable to set the Bradford Canal on fire, as this at times formed part of the amusement of boys in the neighbourhood. They struck a match placed on the end of a stick, reached over, and set the canal on fire, the flame rising six feet high and running along the surface of the water for many yards, like a will-o'-the-wisp; canal boats have been so enveloped in flame as to frighten persons on board. Bradford Beck, like other streams in the West Riding on which population has grown up and manufactures have been established, has been choked with solids and polluted with fluid refuse, waste dyewater, soapsuds, and sewage. Throwing in of solids has been prohibited in the town, but on inspection it is evident to sight that any municipal rules to this effect are broken. At some of the large mills mounds of cinders from the steam boilers are placed against walls bounding the beck, evidently to fall or be washed in by rain, and in some instances trap-doors are suspiciously handy for the admission of such ashes into the beck. Although there is a preventive power within the borough, this does not extend beyond, and, consequently, solids, including furnace ashes, are systematically thrown into the tributaries of Bradford Beck.

Leeds is situated on the river Aire. There are tributaries flowing through the town; these are Sheepscar Beck, Holbeck, Benyonbeck, Balmbeck, and Dow Beck. In the year 1080 Leeds was a farming village, having a population of about 300. Bede, in 735, calls Leeds Levdys; in Domesday survey it is Leedes. The population of Leeds at present is about 228,000, the rateable value was 593,779*l.* in 1865, and is rapidly increasing. The parliamentary and municipal areas are coextensive. There are 15 townships within this area, and until the year 1866 each township exercised independent jurisdiction over highways, roads, and drains. The local municipal government has, however, been consolidated.

The principal trades now carried on in Leeds are, in manufactures, woollen, worsted, linen, flax, and silk. There are cloth dressers, large dyers, waste and mungo dealers, and the most extensive tanneries in Great Britain. Many tanneries are situate in a district called Joppa. There are paper mills, oil mills, corn mills, saw mills, chemical works, and glue works, bone mills, iron workers, wire grinders, machine makers, and most extensive iron and steel works. The worsted trade has of late years declined in Leeds.

Up to the year 1841 Leeds was partially supplied with water for domestic uses from the river Aire, being pumped by steam-power from near Leeds Bridge. This

source became so polluted that the works were abandoned, and at present water is taken from the Wharfe; but a great extension of the Leeds water supply is under consideration from the district on the Washbourne, where water of a fine and pure character may be obtained from the millstone grit formation.

Leeds has been partially sewered and drained, the entire volume of sewage, solids and fluids (from 7,000,000 to 12,000,000 gallons per day) being turned into the river Aire above Thorpe Hall pastures, creating a great nuisance.

The whole of the becks flowing through the town are fouled with waste refuse from dyeworks, tanneries, and the various other manufactures, from their source beyond the municipal boundaries to the Aire, which river is also polluted along both margins. Carcasses of dead animals float down until intercepted by shoals and banks, where they remain to become putrid and most offensive. No adequate form of water conservancy is exercised either within or beyond the area of the borough. As the population of Leeds has increased, and manufactures have been extended, the local death rate has risen, until the town is ranked by the Registrar-General amongst the most unhealthy of Great Britain. In the township of Leeds the death rate from 1851 to 1860 was 28 per 1,000, and from 1860 to 1864 was 29·5 per 1,000.

At the skinneries and tanneries portions of the waste materials are utilized. Hair from hides is sold for the manufacture of carpets and cheap blankets; that which will not serve such purpose is sold for manure. The parings and fatty matter cut and scraped from the hides is sold for glue-making. Spent bark is carted away, or is burned in steam-boiler furnaces. An attempt has been made to irrigate grass land with the fluid refuse from tanpits near Leeds, but it appears to have been used in a state too strong, as some of the grass was injured. Sewage from a town or from a manure tank will kill vegetation, as will guano and other manures if applied in too great strength. Manures of any kind must be applied to land under proper conditions if the full benefits they are capable of giving are to be obtained. The site on which Leeds stands is flat on both sides of the river Aire, and also on the margins of some of the tributary becks, but middle and higher portions of the town are on sloping ground, affording good surface gradients. This natural advantage to the free flow of sewage of a quick gradient has been made a disadvantage by constructing sewers and drains having no adequate provision for full and constant ventilation. The houses in the older parts of the town are built in narrow streets and close courts, having common privies, and cesspits crowded in amongst the cottages; in upwards of one thousand instances parts of cottages (bedrooms) are placed over such foul receptacles of putrid matter. It is these mal-arrangements, in conjunction with stream and river pollutions, defective ventilation of sewers and drains, and defective river scavenging, which cause the mortality in Leeds to be so large. There are about 45,000 houses within the borough, and 12,000 privies and cesspits, besides waterclosets, of which there may be 4,000 or 5,000 at present in use. Storing human excreta in cesspits close to houses until the mass becomes putrid is one of the prime causes of preventible disease. Such cesspits are emptied at great cost in money, but they are never cleansed. The bottom and sides are saturated with the taint of rottenness, so that during summer an empty cesspit may cause more injury than when full. Typhus fever is one of the most fatal diseases of operatives, and is also most costly to the community. A labouring man in the prime of life, when killed by typhus fever, generated and intensified by filth allowed to accumulate near his dwelling, beneath his bedroom, in pigsties, in unventilated sewers and drains, or in polluted rivers, leaves his widow and children an abiding burden on the parish. This problem may be worked out stage by stage to the clearest demonstration in hundreds of instances. The privies and ashpits are said to be cleansed betwixt 10 o'clock at night and 7 o'clock in the morning, when the "stench" in the locality under such operation is described as "fearful." About 55,000 tons of such refuse is removed each year, at a gross cost of 7,000*l.*, and an actual loss of about 4,000*l.* The foul state of the becks and river Aire may be inferred by the number of carcasses of pigs, dogs, cats, &c., having been removed to the extent of fifty in a a day; but it must not be inferred that these carcasses are removed with any degree of regularity. Pollutions in Leeds may be placed in the following order as indicating their injurious effects on health:—Polluted subsoil and atmosphere by cesspits and pigsties, polluted water-courses from manufactures, and fouling of becks, river, and atmosphere by defective sewerage and deficient sewer ventilation; these nuisances may be mitigated by improved works and better regulations, so as to reduce the local sickness and materially lessen the annual death rate. The property in Leeds and the trade of Leeds may be fairly called upon to contribute by a small rate to pay for the necessary establishment charges, but they now pay a tax in the form of poor's rates

and charities more than would be required to establish and continue preventive measures. The misery suffered by sickness, and the loss in wages to workmen, if fairly valued, would show that they and their families lose more by neglect of proper sanitary regulations than they would have to pay in money judiciously expended on sanitary rates for proper regulations and efficient works.

Todmorden is situated at the head of the river Calder, which rises at the base of the range of mountains dividing Yorkshire and Lancashire. Millstone grit forms the dividing ridge, and prevails down to the coal formation, which crops out at Halifax and Huddersfield. The mountains range from 1,200 feet up to 1,500 feet elevation, the average rainfall in the district being about 50 inches, in a dry year falling as low as 34 inches; in a wet year reaching up to 67 or 70 inches. The population of Todmorden was in 1801, 2,513, and at the census of 1861, 9,146. The principal trade carried on is cotton manufacture.

A great abuse of the river Calder takes place at Todmorden by general neglect and by throwing in ashes, road scrapings and other solids. The river water is also polluted by sewage, privy refuse, and by fouled water passed in from the several mills. The stream has been partially embanked, but so inefficiently that some portion of such banks usually give way during floods, causing heavy losses to manufacturers and work-people. The mills, machinery, and goods of the manufacturers are injured, and the working people are deprived of employment and wages during the intervals of restoration and repairs. The site on which the town stands is a tolerably level space of land several hundred feet above the sea. The river winds over this ground, and has been raised in its bed, partially by the action of rain-flood waters washing gravel sand and silt from the mountains, and partially by the inhabitants and manufacturers throwing in solids, such as road scrapings, steam-boiler ashes, and the ordinary rubbish common to a town population. There are also mills and weirs which pond the water at certain points; and road bridges have been constructed so low as to impede and back up flood waters, thus adding to the mischief and loss which occurs. At page 398 of the Evidence, a woodcut cross section is given of the river, showing its weak embankments, the relative level of the adjoining turnpike road, of the land, and also of the former bed of the river; the ordinary water line and the flood line to which the water rose on the 16th November 1866 has been added. Our local inquiry was made on the 19th of November, or three days after the flood of the 16th. We inspected the houses in the district, and found that the basements of large mills, containing carding machines and power looms, had been flooded so as to injure much of the partially manufactured goods and utterly to ruin portions of the machinery. Many cottages had been flooded to a depth of several inches, causing great discomfort to the inhabitants.

Some of the manufacturers do not throw their steam-furnace ashes into the river, but have them carted away. Others having always got rid of their ashes (to the extent of several hundred tons per annum) by throwing them into the stream, consider that they have acquired a prescriptive right to do so, which they will defend at law against any objecting manufacturer or riparian owner situated below; but here as elsewhere a prohibition against river abuse by solids and pollution by fluids exercised under Parliamentary river conservancy powers would obtain willing obedience from all parties.

Halifax is a corporate and parliamentary borough, having a population of 56,000 and a rateable value of 165,000*l*. The town is situated on the river Hebble, which is a tributary of the river Calder. The average rainfall is about 36 inches. It is one of the chief seats in the West Riding of the woollen and worsted manufactures. Millstone grit forms the stratification from the western dividing ridge of mountains down to the edge of the coal-field at Halifax. The town is built on ground sloping up from the river Hebble on both sides. Good building stone is obtained from quarries in the locality.

The corporation is proprietor of waterworks, consisting of extensive storage reservoirs, situate above the town: the water is of good quality. There are about 11,500 houses and some 960 waterclosets and 5,000 or 6,000 privies and cesspits. Main sewers have been constructed at a cost of 65,000*l*. The sewers pass the sewage into the Hebble, and so on into the Calder. Much solid refuse is thrown or is washed into the river within the borough, although there is a municipal bye-law against this form of abuse, but beyond and above the borough there is no local control.

The main sewers in Halifax had not been ventilated to such an extent as is necessary, neither had all the houses been drained. From these and from other sanitary defects there was a local death rate in 1861 of 34 per 1,000; by improved

management this has since been reduced to 24 per 1,000. At some large mills the privies are so arranged that the solid falls into receptacles specially provided, and is carted away at intervals to be applied for agricultural uses to land. This practice is not general, but may be made so with advantage.

The several large manufactures, both in Halifax and on the streams above the town, pollute the waters by fluid refuse from washing, scouring, and dyeing. Complaints are made as to special pollutions, but the law is powerless as it exists at present. Special nuisances may be proceeded against by indictment if they can be proved injurious to health, but the onus of such proof must be taken by the prosecutor, and as there is no independent tribunal empowered to provide, enforce, and levy rates to pay for works of prevention, the evil goes on unchecked and accumulating. The streams flowing into and through Halifax are polluted in proportion to the extent of local manufactures, and if no precautionary measures are taken to prevent or to diminish pollution, it will go on increasing with the growth of local trade. The great manufacturers experience the evils of river pollution to which they contribute, and foresee some of the inevitable consequences to which such pollution must ultimately lead, and are willing to aid in carrying out any well-devised remedy. Local association for prevention of abuse and pollution of the streams has been tried and has failed in Halifax.

Huddersfield is one of the principal seats of woollen manufacture. It is situate on the river Colne, which falls into the river Calder. The town stands on the edge of the Yorkshire coalfield, having millstone grit westward, rising up to the ridge of mountains dividing Yorkshire and Lancashire, and ranging from 1,200 to 1,800 feet elevation above the sea. In the year 1801 the inhabitants of the township numbered 7,268; at the census of 1861 the number had increased to 34,877, and this increase is going on. Huddersfield is at present governed by Commissioners. A charter of incorporation is contemplated. The Commissioners have provided waterworks, an extension of which is under discussion; they have also partially sewered and drained the town. Huddersfield is surrounded by manufactories and populations situated on the streams which flow down to and through the town. A list of these mills and of the owners or occupiers, with other details in full, will be found embodied in the Evidence, pages 104 to 109. The whole of the streams in the watershed of the Colne and its tributaries, from the dividing mountain-ridge down by the river Calder, are more or less abused by throwing in solids, as excavations from foundations, ashes from steam-boiler furnaces, road scrapings, &c. In some instances, soaps and oils used in washing and dressing cloth and wool are partially recovered, but not so as to remove all injurious matters from the water. Sewage, dye-waste, and other fouled liquids are poured out to pollute the streams. Mud from the several goits and lodges is flushed from the mills above to those below, and so on to the river Calder.

Dewsbury is an ancient township, situated on the river Calder, and in the midst of the Yorkshire coalfield. The population of the town and suburbs is about 25,000. Dewsbury, Batley, and Heckmondwicke have by joint parliamentary powers established waterworks. The local manufacture is chiefly heavy woollen goods, as witneys, Devons, pilots, kerseys, sealskins, flannels, baizes, serges, blankets, druggets, rugs, coverlets, collar-checks, carpets, cloths, and goods of finer sorts. Dewsbury is also the centre of the shoddy trade. The town has been partially sewered, and some of the houses drained. There are many common privies having cesspits. The town enjoys the accommodation of both water (river and canal) and railway communication. The several mills and dyeworks pollute the river by pouring in their fluid refuse; sewage is also discharged into the river. Urine is used in scouring heavy woollen goods, and is collected from the population around. Dewsbury and the other towns in the district are carrying on a large trade, which has rapidly increased and is increasing, but only so far by more and more abusing and polluting the several tributary streams and the river Calder. There are men living who fished and caught fish in these streams, where, at present, fish life in any form has been rendered impossible. An intercepting drain has been jointly made, parallel with the river Calder, by eight manufacturers, to receive the waste water and dye refuse from each mill, and pass it down beyond the lowest of these eight mills, so that as each mill pumps water from the river intervening, it is equally pure to the entire number. The volume of polluted water is, however, discharged at the lower end of the intercepting drain, so that the river is more polluted at this point than if each mill discharged its refuse water independently. This power of interception would be turned to common advantage if carried

out, as it may be, on a greater scale, and the entire volume of polluted water clarified before discharging itself into any stream or river.

Wakefield is situated on the Yorkshire coalfield, at the north side of the river Calder, which is navigable to the town. It is a municipal and parliamentary borough, having a population of about 23,000 inhabitants. Near the town are the House of Correction, the West Riding Pauper Lunatic Asylum, and the Union Workhouse. There are a new market-place, market-house, and slaughterhouses. There is a weekly market for cattle and sheep, as many as 1,000 head of horned cattle and 13,000 sheep having been penned and sold in one day. The average sale is, however, about 800 beasts and 6,000 sheep. This special trade in live stock materially adds to the pollution of the river below the town. There is a large trade in corn, malt, and wool; worsted spinning is carried on, and there are several dyehouses. Cocoa-fibre mats and matting are made and woven extensively at the prison, as also by private firms. The town is partially sewered and drained, the sewage containing the washings of the cattle and sheep-pens, as also of the slaughterhouses, being delivered into the river Calder below the town. A private waterworks company pumps water from the river below the outlet of the sewage, and filters it for the domestic uses of the inhabitants. A description of the works and the processes of clarifying and filtering this water is embodied in the Evidence. The mayor and others remembered in their youth fishing in the Calder, opposite Wakefield; at present the water comes down containing the sewage and dye-water refuse, soap waste, and other forms of pollution as discharged from Todmorden, Halifax, Huddersfield, Dewsbury, and all the other towns, villages, mills, and dyeworks situate above. In dry weather the banks of the river are covered with dark thick slime, and the entire volume of water is stained with dye-refuse. There are many common privies and cesspits, causing local nuisance and excess of disease. The earth-closet system has been tried at the prison and a letter from the governor on the subject will be found, Appendix No. 2.

Pontefract, commonly called Pomfret, is an ancient borough and market town. It was a borough in the reign of Edward the Confessor, but it was not incorporated until the second of Richard III. The population is at present about 5,300, and the rateable value 15,000*l*. The local government is vested in the corporation and in 33 self-elected street commissioners; these two bodies act independently of each other, from which divided jurisdiction much injury arises in sanitary and other respects. The mortality has increased from 14·8 in 1861 to 29·1 in 1866. The Local Government Act has not been adopted. In such large towns as Birmingham, Sheffield, Leeds, and in other places, street commissioners have been superseded by the corporations, which in all cases are representative. Pomfret moves more slowly in consolidating her means of local self-government. The town has been partially sewered, the sewage flowing into the canal. There are 1,202 houses and 175 waterclosets. There are waterworks in the hands of the commissioners; water is pumped by steam-power. Pontefract is situate on the permian or magnesian limestone formation, at the eastern margin of the Yorkshire coalfield, and at some distance from the river Calder. The town of Castleford is situated near the junction of the rivers Aire and Calder. In neither town is there much of the woollen or worsted trades carried on. Inquiry was made at Pontefract because it is situate in the lowest drainage area of the combined watersheds, and though serious pollutions are not added either by Pontefract or by Castleford, the river Aire bears along the combined pollutions of the entire drainage areas of both itself and the Calder, and consequently the whole of the pollution of the woollen and worsted manufacturing district of the West Riding.

The injury inflicted by the river pollutions of these and other towns to the estates of many riparian owners is very great; streams which in the memory of men now living were comparatively pure and well stocked with fish, are now black and stinking. The land through which such polluted streams flow is ruined for residential purposes, and is injured and reduced in value even for mill purposes; the water is so bad as to be considered unfit for manufacturing uses, and other sites are selected where water can be obtained from canals, or by sinking wells and boring. In many instances cattle will not drink the local river water, and farms are depreciated in consequence. Large country-houses which formerly, with their river frontage, rights of fishing, and ornamental gardens and pleasure grounds, were valued as residences, have been abandoned, or are let merely at farming rents and for farm purposes. The cattle plague prevailed to a great extent in the Thorp Hall meadows below Leeds, and on lands bordering foul rivers in other districts. This fatal disease was considered by the tenants and riparian proprietors to have been aggravated by the foul state of the water,

and by the tainted atmosphere caused by river pollutions. The towns are poisoned in some degree by their own sewage and cesspool matter, and are taxed to a considerable extent to remove this putrid refuse in a most barbarous manner. Manufacturers pollute the water for each other until the streams have to be abandoned for all but the coarsest purposes of trade, and clean water has to be purchased from waterworks companies, or must be sought at great cost in well-sinking and boring, to which must be added the charges for extra steam-power. In some cases the manufacture and dyeing of finer sorts of goods has been necessarily abandoned, and in other cases extension of manufacture is rendered impossible because there is no additional volume of clean water to be obtained in the district.

Water Supply.

We have already shown in previous sections of this Report how great a change has occurred in the condition of the rivers of the West Riding of Yorkshire during the last century and indeed within the last 25 or 30 years. Several witnesses examined at Wakefield and at Leeds spoke to the original purity of the rivers Calder and Aire, which at those points carry the combined waters of many subsidiary valleys and of large areas of country.

Mr. Rhodes, the Mayor of Wakefield, says, "In my early days the river here was "pure or nearly so. I am speaking of the river Calder: the water was sweet and clean, "and it was full of fish;" and Mr. Oxley, the Mayor of Leeds, in reply to the question, "Have inconveniences been suffered within the borough of Leeds from the pollution "of the river, and the water being rendered unfit for drinking purposes?" said, "So much so, that I know formerly the water that was supplied to Leeds for domestic "purposes was taken from the Aire; but it became so offensive that of necessity a "different supply was sought for." And this evidence was abundantly confirmed by many other witnesses. Of the condition of the river Calder at Wakefield, and the most important streams of the district at the present time, the Commissioners scarcely required evidence other than that afforded by their own observation; but such evidence abounds for those who will take the trouble to read the shorthand writer's notes of each day's inquiry in Vol. 2 of this report.

With this changed condition of the rivers, with foul instead of clean water flowing in the smaller streams, past hamlets and villages, and water still fouler because more repeatedly used and abused flowing in the rivers and through the large towns, we are prepared to find greatly diminished facilities for the domestic supply of the district, and ought to find corresponding arrangements for obtaining that supply from other sources.

Before the great extension of the woollen and worsted trades, the inhabitants of the West Riding obtained their supply of water for domestic uses from springs or from streams the product of springs, and in a great number of instances they do so now, both in villages and in small towns in the higher parts of the valleys.

The supply of water from springs is however for the most part limited in volume, and in some cases must either be carried home by hand or be purchased from itinerant water-carts at a cost which tends to reduce to a minimum the quantity consumed, and is provocative of uncleanliness and its attendant evils, whilst the streams have in great part ceased to be fit for drinking purposes or even for cleansing or culinary use.

As water becomes more and more monopolised for trade purposes, the sources now used for domestic supply will be still more irretrievably cut off, and unless remedial measures be adopted many of the working classes must be more and more driven to a use of discoloured and tainted water.

In dry seasons many of the inhabitants of the West Riding now suffer a water famine, and that even where there is an abundance of good and wholesome water available if it were properly collected, stored, and distributed.*

The question of the water-supply of the district of the Aire and Calder is so intimately associated with the well-being of the inhabitants, not only as a community requiring this necessary element for general and domestic use, but as a great centre of manufacturing industry to which good water is indispensable, that we require no apology for entering upon the subject in some detail, in order to show what has been, and what remains to be, done towards supplying a want which is now so widely experienced.

It has been seen that the united watershed of the Aire and Calder valleys down to Castleford comprises an area of 708½ square miles, of which the greater portion or about

* For some observations and suggestions in relation to the formation of Impounding or Storeage Reservoirs, see Paper Appendix No. VII,, p. lviii.

600 square miles is covered by millstone grit and the coal measures in about equal proportion; nearly 100 by limestone, and the remainder by the Permian formation, new red sandstone and alluvium.

From the composition of these geological formations the waters of the different parts of the districts take as a matter of course their distinctive characters as to softness and purity. Analyses of some of them are given further on.

The *quantity* of water available for the supply of the West Riding is, as in other cases, materially influenced by the physical, as its *quality* is by the chemical characteristics and conformation of the districts.

The *Basin of the Aire* extends 45 miles above the junction of the Aire and Calder, and is about 8 miles in width. The ridge of the watershed varies in height from 500 feet (opposite Leeds) to 1,500 feet above Ordnance datum. The Aire issues from Malham Cove, a river apparently of much larger volume than the immediate gathering ground would yield. In many places beyond Malham the surface water escapes into swallow-holes, and this water finds its way by subterranean channels to the outlet at Malham Cove.

The *River Aire* flows throughout its course nearly parallel to the ridges of the watershed, at a distance of about three miles from the northern and five miles from the southern boundary in the upper part, and nearly midway between them below the junction of the Bradford Beck. The river falls rapidly from Malham to Gargrave, where it is 360 feet above Ordnance datum; thence it descends more gradually, but with uneven fall to Castleford, where it is 40 feet above Ordnance datum. The Aire for the most part flows at the bottom of a deep valley with hills rising steeply on each side of it.

The *Basin of the Calder* is about 35 miles long, and varies considerably in width; the ridge of the watershed is from 500 to 1,600 feet above Ordnance datum.

The *River Calder* flows nearly parallel to and about five miles from the northern boundary of the watershed. The Colne, which is its principal tributary, rises 13 miles towards the south. As in the Aire Basin the water passes rapidly to the river.

The river resulting from the junction of the two streams, and which below such junction is known as the "Aire" has a gentle fall for nearly 30 miles, till it joins the Ouse a few miles above Goole, collecting the rainfall from a limited area of about four miles in width.

The *rainfall* varies considerably in different localities over this area, for instance—

Mr. Fenwick gives the average rainfall at Holbeck, Leeds, as 21·91 inches (17·04 to 32·18).

The rainfall at Bradford is 36·00 inches.

„ Huddersfield, 32·00 inches (24·39 to 43·83).

The average of 37 years at Halifax, 32·06 inches, varying from 24 to 41 inches.

On the ridge of the basin it reaches 50·00.

The annual average throughout this district is probably about 36 inches, and in droughty seasons about 24 inches per annum.

As regards the *extreme upper part* of the Aire basin which rests on limestone, the water both in the river itself and its tributaries is hard, but not inordinately so; and the question of water-supply, so far as quality is concerned, is not of pressing importance. The rainfall is abundant, the population sparse, and the river very little polluted.

The millstone grit supplies a large volume of the purest water, but many towns, as Bradford and Halifax, have quite outgrown the water resources of the vallies on which they are situated; with coal abundant on the one hand, and pure water from the millstone grit plentiful on the other, they were originally most advantageously placed to meet a rapid increase of trade. Coal is still abundant and cheap, but water, except from a distance, has failed them.

Large quantities of water are drawn from deep wells and bore-holes, but the incessant drain upon the substrata sensibly diminishes this source of supply as shown in the evidence, especially at Leeds and Bradford. The supply of water for trade as well as for domestic purposes has thus become rapidly dependent on distant sources.

Some of the large towns bordering on the millstone grit have at great expense obtained supplies of excellent water from gathering grounds on that formation within the Aire and Calder basins. Leeds and Bradford take water not only from these, but from the Wharfe valley as well.

The water supply of *Leeds* 30 years ago belonged to a private company, and was obtained from the Aire; it is now in the hands of the corporation, and is derived chiefly by pumping from the river Wharfe. The entire volume obtained appears to be about 4,500,000 gallons per diem, of which 500,000 gallons is taken by manufacturers, the

remainder being applicable for domestic and public purposes. The domestic supply is constant, but, as a whole, is becoming insufficient from the growth of trade. Many springs hitherto used for trade purposes are now failing from the increasing drain put upon them by wells and collieries; from one colliery alone belonging to the Low-moor Iron Company at Beeston 2,500,000 gallons being pumped daily. Fresh demands are in consequence made by manufacturers upon the corporation waterworks.

The quality of the present supply is also a ground of complaint. The water of the Wharfe, liable to occasional discolouration from peat, is now becoming deteriorated by the discharge of sewage and manufacturing refuse from towns and places on the banks above the pumping station. In consequence of this, and in anticipation of the increasing wants of a town growing both in population and manufactures, the corporation are now applying to Parliament for powers to resort to a new source, and to bring in a daily volume of 20,000,000 gallons of water.

The corporation of *Bradford* now supplies 1,500,000 gallons per day (or about 12 gallons per head), for domestic, 500,000 gallons a day for public, and 2,500,000 gallons per day for trade purposes, in all 4,500,000 gallons per day, and expects to bring into the town and neighbourhood 10,000,000 gallons per day when the works are completed.

The corporation of *Halifax* supplies now 1,250,000 gallons per day, or 12 gallons per head for domestic purposes, and 292,000 gallons for trade purposes, and will, when works now in progress are finished have a supply of 3,700,000 gallons per day.

Huddersfield has an insufficient and therefore unsatisfactory supply of water for domestic purposes, varying from seven to 10 gallons per head. In 1864 one reservoir was dry and the supply partially ceased. The waterworks are managed by commissioners. More happily situated than others, some of the manufacturers of Huddersfield have an abundant supply for their purposes drawn from the narrow canal, and from springs, and wells on their own premises, or from reservoirs in which they impound the water of the Colne and Holme when it comes down pure; the supply for domestic purposes is, however, acknowledged to be deficient, and the commissioners have applied to Parliament for powers to improve it, but hitherto without success. At present the poorer inhabitants of Huddersfield are occasionally very badly off for water. Mr. Abbey, the surveyor to the commissioners, remarks: "The millowners have fouled the stream, "which was the natural supply of the district. The water was used originally by many "people for culinary purposes, and while the millowners have taken away this natural "supply from these streams, they have not of themselves provided an artificial supply "for those poor inhabitants." As the necessities of *trade* require it there is a call for an improved water supply, and means will be found for accomplishing it.

The trade of Yorkshire is the very life of its inhabitants, poor as well as rich, and any measure would be a fatal blunder which should improve the state of the rivers and the water supply generally to the serious injury of that trade; but we contend that not only is a purification of the rivers and an improved water supply compatible with the best interests of the manufacturers of Yorkshire, but that if the woollen and worsted traders are to continue to progress as they have done up to this time, if even they are to hold their own and continue to prosper at their present developments, such improved water supply must be found and that without delay. We do not believe that any opposing class interests need exist or do exist in the matter, it concerns all alike.

As regards Huddersfield there are no physical difficulties in the way of obtaining an abundant supply of most excellent water.

Dewsbury, Battley, and Heckmondwicke have a combined system of water supply, and there was no scarcity of water during the droughty season of 1864.

The water brought to these towns is used not merely for domestic purposes, but largely and increasingly by the manufacturers. The importance of this for trade is insisted upon by many witnesses; soft water is in fact of great value, and has become an important source of revenue to some of the corporate bodies.

The population of the *lower part* of the Aire and Calder on the coal measures, magnesian limestone, and new red sandstone is very badly supplied with water. The demand for water is enormous, both for domestic and trade purposes. A population amounting to nearly 750,000 is congregated in a small area in dense masses, and vast works are carried on; both population and trade are rapidly increasing. There are not facilities for meeting this demand in a fit and adequate manner; not only are the rivers more impure, as they have received the pollution of the upper districts, but the same circumstances which cause the demand to be great have tended to spoil the supply, and the growth of population and of manufactures has caused a corresponding increase of discharge of sewage and manufacturing refuse into the running waters.

Thus the natural and obvious water supply—that from the rivers and streams in a great measure derived from the millstone grit—is ruined. The water of the subsoil is both inferior in quality and insufficient in quantity. The millstone grit formation, which abounds in water, is at a distance; the large towns of the lower district are consequently reduced to straits. Leeds has to seek for a reinforcement from sources beyond the basin of the Aire in the valley of the Wharfe. Wakefield has as yet provided no better supply for its inhabitants than the polluted Calder. Castleford and Knottingley have to choose between drawing from the foul river or from wells which are capable of yielding only an insufficient and precarious quantity of hard water.

Manufacturers frequently sink bore-holes in their own premises, but this source is apt to fail, so incessant is the drain upon the subsoil water; the richest dig the deepest, and drain the wells of their poorer neighbours, and in their turn are liable to have their own wells drained by pumpings from the collieries.

The water supply to *Wakefield* is a striking instance of the consequences of the uncontrolled pollution of the river. The Calder in its course to Wakefield has drained an area containing 400,000 inhabitants, chiefly engaged in manufacture, and has received directly as well as from its tributaries pollution by sewage, chemical and dye-waste, and many sorts of manufacturing refuse. To this pollution Wakefield, a manufacturing town of 20,000 inhabitants, adds the contents of its own sewers, and the discharge from its own manufactories, and having done so, draws from the stream three-fourths of its water supply. Such a source for human consumption is of course highly objectionable, and at a former period when the water was supplied without preparation or at the most only after sand-filtration it was no doubt unwholesome, as seems to be proved by some cases that were mentioned to us. But the company who own the waterworks, spare no pains by artificial means to improve the quality of the water. The time chosen for pumping from the river is after a fresh, when the volume of water, as compared with the pollution in the river, is the greatest. It is pumped into settling reservoirs of ample size, in drawing from which means are adopted that only the purest part of the water is taken, and this is then filtered by Mr. Spencer's process through carbide of iron. A water is produced bright in appearance, and not injurious to health; in short, as was described to us, "a very fair drinking water." But however free from impurity the water may thus become, the fact that it has been obtained from so impure a source remains, and accounts for if it does not justify the repugnance to it which is felt by many inhabitants of Wakefield.

Castleford has no regular water-supply; the inhabitants about 6,000 in number have to provide water for themselves. For this purpose they resort mainly to wells, but partially still to the river. The river is very foul, and the wells appear to be not sufficiently guarded against impurity, and are liable to be drained by the pumping of collieries in the neighbourhood. In consequence the inhabitants of Castleford suffer in health as well as comfort.

The inhabitants of *Knottingly* are in as bad a plight. They have abandoned drawing water from the river; their supply is now from wells and from the Goole canal, which three miles above receives the overflow from the Pontefract sewage tanks.

To many outlying villages the pollution of the river is an evil as yet without redress. Their natural supply has been taken from them and they are beyond the reach of town waterworks; it is only right that towns, as being the chief causes of river pollution, should extend as far as possible to neighbouring villages the advantages of their artificial water-supply, affording a district rather than merely a town supply. This has already been done in the case of some towns, as, for instance Halifax and Bradford.

But the present condition of the Aire and Calder does not injuriously affect the water-supply for domestic use only; loud complaints are made by manufacturers and landowners. Many who are obliged to use the river water for dyeing and other purposes complain very much of its pollution. In some cases cattle will not drink the river water, and occupiers of land suffer from this cause.

An abundant supply of water of good quality becomes indeed yearly of more vital importance in this district. New towns are springing up, villages expand into towns, whilst some of the large towns have increased twofold within the last 30 years, and an extensive area is rapidly being covered with manufactories of various kinds and residences for those employed in them, so that if the past rate of increase continues the lower part of these valleys will ere long become one connected and continuous hive of manufacturing industry.

We have elsewhere in this report shown that there is no excuse for the discharge

of any sewage or ochrey matter into the running streams and rivers, and that the pollution from soapsuds, dyeing, and other processes, may be prevented, or at all events greatly alleviated.

If stringent measures are adopted to this end the Aire and Calder will be immensely improved as a source of water supply for Wakefield, Castleford, Knottingley, and other towns and villages situated on these rivers.

This leads us to make some observations on the chemical composition of the water.

The waters of the Aire and Calder above the seats of manufacture are derived, as before remarked, almost exclusively from limestone and millstone grit. The following analyses of samples, mostly collected by ourselves during our inquiry, and all of them analysed in the laboratory of the Commission, show the relative purity of these waters before they were polluted.

From the Limestone.	Solid Residue. Grains per Gallon.			Hardness (Degrees of Clarke).		
	Mineral.	Organic.	Total.	Permanent.	Temporary.	Total.
Spring feeding Malham Tarn -	12·13	1·44	13·57	5·00	4·83	9·83
Aire at Malham, when low -	12·00	0·92	12·92	5·49	4·12	9·61
„ „ when flooded	10·53	1·09	11·62	5·88	2·87	8·75
Spring below village of Malham -	9·96	0·34	10·30	3·64	4·41	8·05
Average of four samples -	11·15	0·95	12·10	5·00	4·06	9·06
From the Millstone Grit.						
Bradford.—Stubden reservoir -	4·93	0·77	5·70	3·25	—	3·25
Second sample ditto - -	3·86	1·18	5·04	8·59	—	2·59
Manywells springs at Hewenden	5·40	0·12	5·52	2·24	—	2·24
Second sample ditto from service reservoir.	6·80	0·89	7·70	3·57	0·07	3·64
Halifax.—Ogden reservoir -	4·16	0·55	4·71	2·80	2·75	5·55
Huddersfield.—Holmfirth reservoir	3·33	0·76	4·09	1·86	—	1·86
Brook at Digley below Holmfirth reservoir.	3·81	0·60	4·41	1·89	0·18	2·07
Wessenden reservoir - -	2·82	0·68	3·50	1·69	0·83	2·52
Standedge reservoir - -	3·68	0·20	3·88	2·25	—	2·25
Average of 9 samples -	4·31	0·64	4·95	2·46	0·42	2·88

From this table it will be seen that whilst the water of the millstone grit contains about five grains of solid matter in the gallon, that derived from the limestone furnishes upon analysis 12 grains of such residue. The water of the limestone contains on the average half as much more organic matter as that of the millstone grit. Such a result would appear at first sight to militate against general experience; limestone waters in their natural state of purity are usually free from peaty and other organic matter, whilst water from rocks not containing carbonate of lime—such as the millstone grit—are liable to be coloured by peat.

The explanation in the present case is perhaps that whereas the Malham samples were taken from the open stream, almost immediately after the collection of the water upon the surface, the other specimens are from artificial reservoirs, where large volumes of the water remain in comparative rest, and have an opportunity by deposition, and the chemical action of air and light of becoming free from organic taint.*

The hardness of the water from the limestone is fully three times as great as that from the millstone grit. Omitting the sample from Ogden reservoir, which probably receives part of its hardness from limestone within the area of the gathering grounds, we have a total hardness of about $2\frac{1}{2}$ degrees as the average of the eight samples from the neighbourhood of Bradford and Huddersfield. And with the same rectification nearly the whole of this hardness is seen to be "permanent," that is to say that the water is not reduced by the process of boiling as is the case with the waters from the limestone.

It is to be noticed that these latter, though derived from a limestone district, are not nearly so hard as those derived from *chalk*. From true chalk springs, as in the valley of the Thames, the water issues of a hardness of 17 or 18 degrees, and although

* It may be as well to state here that in these as in all cases the water is carefully filtered in the laboratory before analysis, and the figures given represent only the matter *in solution*.

in the streams themselves this amount is considerably reduced by the influx of surface water from clay and non-calcareous soils, still even when delivered to the London public the water has a hardness of about 15 degrees.

The following analyses of water of three of the London companies made in the Commission laboratory may serve for useful comparison with West Riding supplies.

	Solid Residue. Grains per Gallon.			Hardness (Degrees of Clarke).		
	Mineral.	Organic.	Total.	Permanent.	Temporary.	Total.
New River, Nov. 5th, 1866 -	20·86	0·68	21·54	4·85	9·88	14·73
Grand Junction, Nov. 5th, 1866 -	20·79	0·99	21·78	5·98	8·75	14·73
Ditto, Dec. 3rd, 1866 - -	21·83	0·35	22·18	4·12	10·81	14·93
East London, Nov. 2nd, 1866 -	21·66	0·76	22·42	4·43	9·88	14·31
Ditto, Dec. 3rd, 1866 - -	23·35	0·76	24·11	5·46	9·98	15·44

Compared with the water supply of London the natural waters of Yorkshire even from the limestone have the advantage both in total solid contents and in hardness, whilst those of the millstone grit excel in a much higher degree. In speaking of "hardness" in water a Yorkshireman has indeed in his mind a different standard to that with which a resident in the south of England is familiar—a fact which should not be lost sight of in reading the evidence. Persons accustomed to the hard wells of many districts of England look upon London water as "soft" water, whilst witnesses at Leeds spoke of the present supply of that town derived from the Wharfe, and which is not more than nine degrees, as *too hard* for the purposes of the town.

The following are analyses of other samples collected during our inquiry.

	Mineral Residue. Grains per Gallon.			Hardness (Degrees of Clarke).		
	Mineral.	Organic.	Total.	Permanent.	Temporary.	Total.
Bradford. Tay beck, valley of the Wharfe	4·00	0·76	4·76	2·94	0·98	3·92
Bradford. Barden beck, valley of the Wharfe.	3·09	1·03	4·13	1·89	0·07	1·96
Bradford. Howgill, valley of the Wharfe, limestone districts.	7·85	1·32	9·17	4·62	0·21	4·83
Bradford. Holden beck, valley of the Aire.	9·04	0·54	9·58	5·04	—	5·04
Bradford. Heaton service reservoir, Bradford.	8·09	0·82	9·72	4·90	1·54	6·44
From "Bradley Spout," John William Street, Huddersfield.	26·38	0·62	26·69	11·89	—	11·89
Company's main at George Hotel, Huddersfield.	6·62	0·31	6·93	3·85	0 98	4·83
From spring at brewery of Messrs. Bentley and Shaw, Huddersfield.	9·56	0·45	10·01	5·95	—	5·95

From the first four analyses, and those which are given in preceding tables, it would appear that as to *quality* of water Bradford has nothing to complain of. The same is true of Huddersfield. Of the *quantity* supplied to these two towns we have elsewhere spoken. The water from "Bradley spout" is beautifully bright and pleasant to drink, and we were informed that it is much esteemed for that purpose; it is, however, exceptionally hard, and contains a high proportion of solid residue per gallon.

With examples of the natural and unfiltered water of the districts before him, let the reader now contrast its condition after receiving the impurities so liberally added to the rivers in their course past the different mills on their banks.

The Colne, which takes its rise in the hills above Huddersfield, is joined by another stream, the Holme, at Lockwood, and flows past Huddersfield on its way to the Calder.

The water of Redbrook reservoir at Standedge and of the Wessenden reservoir on the Colne, and of Holmfirth reservoir on the Holme, may fairly be taken as representing the natural and unpolluted water of this district, and we accordingly have associated the average analysis of these three reservoirs with that of the Colne at Lockwood above, and at Bradley below Huddersfield.

	Solid Residue—Grains per Gallon.			Hardness (Degrees of Clarke).		
	Mineral.	Organic.	Total.	Permanent.	Temporary.	Total.
Reservoirs at Holmfirth - - Wessenden - - Standedge - - Average of the three.	3·28	0·54	3·82	1·93	0·28	2·25
Colne at Lockwood, above Huddersfield	8·11	0·69	9·80	4·20	0·40	4·60
Colne at Bradley below Huddersfield	10·53	1·47	12·00	4·75	0·10	4·85

On the Colne and the Holme above Lockwood there are many mills, and their effect upon the water, assisted by sewage and other causes, is to increase the quantity of salts &c. in solution from $3\frac{3}{4}$ grains in the gallon to nearly 10, and this is further increased to 12 grains after passing through Huddersfield. The hardness of the water which at its sources is $2\frac{1}{4}$ degrees, becomes at Lockwood $4\frac{1}{2}$, and below Huddersfield nearly 5 degrees.

The Colne, at Huddersfield, is a considerable stream, and it may readily be understood how large must be the discharge of refuse from the mills on its banks to increase threefold the quantity of salts in every gallon of water passing down it. An easy calculation shows that the increase per gallon being somewhat more than seven grains, a thousand gallons will have received one pound, and a million gallons close upon half a ton of soluble salts, the greater part of which have undoubtedly originated in the woollen manufacture and dyeing processes.

In this estimate no account is taken of the quantity of solid suspended matter discharged from these mills, a subject to which a few words will be devoted further on.

The Calder, at Wakefield, is more polluted than the Colne, as shown in the following analyses:—

	Solid Residue—Grains per Gallon.			Hardness (Degrees of Clarke).		
	Mineral.	Organic.	Total.	Permanent.	Temporary.	Total.
River Calder, above Wakefield - -	19·11	1·02	20·13	5·56	3·23	8·79
River Calder, below Wakefield - -	19·85	1·16	21·01	7·41	1·79	9·20

These analyses do not show any very great effect produced upon the river Calder by the impurities reaching it from the town of Wakefield itself, but it must be remembered that the volume of water is at this point very considerable, and it would require a large addition of pollution in the aggregate to make itself felt in the analysis. Nevertheless there is an increase in the solid matter, both mineral and organic, and in the hardness; some part of this matter, moreover, being changed from "temporary" to "permanent," or in other words, from carbonate of lime to sulphate of lime, by the action of the acids and salts discharged from mills.

But the analysis sufficiently shows the agencies that have been at work. The waters of the limestone districts contain not more than twelve grains of solid matter per gallon. Those of the millstone grit do not exceed three or four. Without attempting to determine in what degree each of these varieties of rock may contribute to the Calder by the time it arrives at Wakefield, we may safely assume that at least one half of the salts in the Calder at this point are due to extraneous sources.

The first two of the following analyses show the quality of the river Aire above and

below Leeds, and the third exhibits the effect produced upon its composition by the discharge of the sewage of the town :—

	Solid Residue—Grains per Gallon.			Hardness (Degrees of Clarke).		
	Mineral.	Organic.	Total.	Permanent.	Temporary.	Total.
River Aire, at Armley Foot-bridge, above Leeds	12·56	2·08	14·66	6·14	2·69	8·83
River Aire, below Leeds, but above sewage outfall.	16·80	1·13	17·93	6·48	2·81	9·29
River Aire, below Leeds and below Sewage Outfall.	20·22	1·44	21·66	7·08	3·86	10·94

There is an inconsistency in the proportion of organic matter in the sample from Armley Bridge, for which we are unable to account. It was taken by one of ourselves, with every care to obtain an average sample, but some exceptional cause must have intervened to raise the organic matter to such a proportion. With this exception, there is no question of the accuracy of the result. And we see that to the total solid residue of 14½ grains per gallon above the town, an addition of 3½ grains is made by direct discharge into the river during its passage through it, and of a further like amount by the main sewer below.

The river Aire, below Leeds, and the river Calder, below Wakefield, come thus to have a chemical composition very closely alike.

By the preceding analyses it has been sufficiently shown that the use of the water of the rivers of the West Riding for woolwashing, dyeing, and scouring, and its discharge into the rivers after these processes, has largely increased the proportion of the *mineral matters* of the water; but it must have occurred to an attentive reader that the *organic matter* of those waters has not increased in anything like a commensurate ratio. It is indeed true that whereas the average of three samples of water before given as representing the water of the Colne in a state of purity, namely, from the Wessenden, Standedge, and Holmfirth reservoirs, contains only 0·54 grains of organic matter, the water of the Calder below Wakefield has similar matter to the extent of 1·16 grains, and that of the Aire below Leeds contains 1·13 grains of such matter. This is not an extraordinary proportion to be found in a comparatively pure water, much less in one which is held to be highly polluted. Two of the samples from Malham, and the sample from Stubden reservoir, Howgill and Barden beck are shown to contain more than one grain per gallon of organic matter, and yet there is no question of their purity and freedom from manufacturing refuse.

Again, although it is highly desirable that water for drinking purposes should be as free as possible from organic impurity as well as from mineral salts, (and the water from the reservoir of Redbrook at Standedge near Huddersfield and that of the Manywells springs at Hewenden near Bradford are excellent representatives of such water,) yet it is no uncommon occurrence to meet with a perfectly wholesome water which shall contain considerably more than one grain of organic matter to the gallon. It would seem, therefore, that, so far as *soluble organic* impurities are concerned, the rivers of the West Riding are not really polluted to a great extent, and of this fact there cannot be a doubt, if we are to believe the evidence of chemical analysis. Are we then to believe either that no great quantity of soluble organic matter is thrown into these streams, or that having been so discharged it is removed from solution by some chemical agency? The explanation probably lies in both of these hypotheses. The quantity of soluble organic matter discharged is *not* very great as compared with the bulk of the water. Few of the towns are systematically sewered, and if we omit Leeds, Bradford, and one or two other places, only a small portion of the solid and liquid excrement of the population at present finds its way to the rivers.

Neither do the processes connected with the woollen and worsted trade discharge large quantities of soluble organic matter into the streams. With the first washing of the wool which, on account of the urine employed and other animal matter, gives rise to a sufficiently disgusting liquid, the discharge of organic impurity is practically

at an end. A certain amount of vegetable matter, as gum, mucilage, &c., is no doubt dissolved from the dye-woods, and passes away in solution in the waste water from the vats, but this vegetable matter is small in quantity and not of a nature to be seriously injurious to the water. The soap-liquids in their untreated condition, or even after the imperfect purification to which they have been subjected by the grease extractors, are, as has been before shown, very objectionable when discharged into running waters, but very little of their organic contents is in a soluble condition and that little in contact with the salts of the water soon becomes insoluble.

The refuse matters of the woollen and worsted manufactures which are discharged in *solution* are indeed essentially *mineral*, and this constitutes the first reason why so small an increase of organic impurity is found in the rivers.

The second cause which operates in this direction is the peculiar nature of the mineral matters so discharged. Sulphate of iron and alum, which are largely used in dyeing, are powerful disinfectants and precipitators of putrid or putrifying organic matter. The mineral acids, such as sulphuric and hydrochloric, which are also used in some form, have somewhat similar properties. The mordants employed in dyeing, as salts of tin, zinc, chromium, &c., have all an antiseptic effect, and we have found that the suspended matter of black-dye, which is a compound of iron and colouring matter, is itself a powerful deodorant and precipitant. The quantity of some of these compounds passing into the river is of course small, but the sulphate of iron and the insoluble black matter of the dye-water are discharged in enormous quantity, and these act most powerfully and beneficially in arresting the putrefaction of animal matters of sewage and other organic refuse, separating them from solution, and thus preventing their power of mischief.

We must not be misunderstood to be apologizing for, still less to be justifying, the condition of the West Riding rivers, but we do say most unreservedly that the dye-refuse serves as an antidote to the other refuse discharges of the district, and that were it not so the state of the rivers would be far more offensive in reality, though not to the eye, than it is at the present time.

We repeat that if, by proper precipitation, and by subsidence or mechanical filtration, the solid suspended matter of the dye-waste, together with the iron in solution, could be prevented from passing into them, the rivers of Yorkshire would at once assume a new character. But concurrently with any measure of this nature it would be imperatively necessary to act with the utmost stringency against the pollution caused by sewage and other putrid discharge, a pollution the injurious effects of which are now kept within limits by the discharge of manufacturing refuse; otherwise we should be relinquishing the antidote whilst remaining subject to the bane.

One great argument for the purification of the rivers up to an available point should not be passed over in closing the consideration of this question. Manufacturers require *clean* rather than *pure* water. They cannot get on with water which is fouled by solid suspended matter; but a certain proportion of salts, if that proportion be not excessive, and if it does not include iron or too much lime, is not greatly objected to.

If the water of the rivers could be brought back to a state of sufficient purity for manufacturing purposes it would again come into use for such purposes, and large quantities of purer water now consumed by trade would become available for domestic supply. Renewed purity of the rivers for manufacturing purposes would be synonymous with increased supplies of pure water for human consumption.

Defects of Existing Law relating to Rivers Pollution.

The law, as it at present exists, is only applicable to local and individual cases. There is no power of general application. One town or one manufacturer may be proceeded against, but there is no authority having the means and the power to deal with nuisances throughout an entire drainage area.

We found the law relative to the pollution of these rivers to be the subject of general and well grounded dissatisfaction. Theoretically, the law recognizes that protection is due to public and private rights in running water. It prohibits all public nuisance, and imposes upon each riparian proprietor the obligation of allowing running water to pass on in its course without obstruction or pollution. But a person, judging from the present appearance of the streams in the West Riding, would infer the contrary to be the law, and would conclude that there existed a general license to commit every

kind of river abuse. For, as we have shown to be the fact, the rivers and streams are polluted with sewage and dye-waste, and, except where special legislation for navigation purposes obtains, their course is obstructed by the casting in of solid rubbish. The cause of this variance between the law and the practice is to be found in the difficulties of enforcing the law and the exceptions which are allowed to it.

So far as river abuses affect only private rights, each individual is left to protect himself by putting the law in motion. An aggrieved proprietor has the option of bringing an action for damages in the Common Law Courts or of filing a bill in Chancery for an injunction. Either course is necessarily invidious, expensive, and doubtful in its result. It is invidious because neighbour is set against neighbour, and because it must seem unjust that one manufacturer should be proceeded against and mulcted for doing that which hundreds of others, who do not happen to offend a powerful neighbour, are doing with impunity. It is an expensive remedy. For the same money which is spent over a hardly fought litigation against a single manufacturer, a Conservancy Board, armed with proper powers, might for years keep safe from all abuse a long extent of the river with hundreds of manufactories situated on its banks. The expense incurred by the Aire and Calder Navigation in preventing solid materials from being cast into the *navigable* channel (for this is the limit of their powers) is very trifling indeed. Legal proceedings are also a very doubtful remedy. The plaintiff may prove that he has suffered injury from the pollution of the river and that the defendant has polluted the river above him; but this is not enough. The plaintiff has also to prove that what he has suffered has been caused wholly or in part by the special act of the defendant, which is always difficult—often impossible. For besides the defendant there is probably a multitude of manufacturers who, at various points higher up the stream, cast in liquid refuse from their works; these impurities are carried down by the current, and by the time that they reach the plaintiff's works they are all mingled confusedly together, and the offence of the defendant has ceased to be distinguishable. The plaintiff accordingly fails to establish his case.

Even where successful these private attempts to protect the river are but little gain to the public. Several instances have come before us where a manufacturer, sued for polluting running water, has brought the litigation to a close, not by ceasing to foul the river, but by simply removing the discharge into the river to a point below the works of the complainant.

Further, the law recognizes prescriptive rights to pollute running water and obstruct its flow, provided such abuse fall short of public nuisance. Such rights we do not hesitate to call privileged abuses.* A manufacturer who, in the exercise of a right so acquired, discharges into the river the solid and liquid refuse from his works may thereby do injury to the river to the extent of many times the money value of the right. But the loss to the public is too serious to be measured by a money standard. If some are permitted to pollute or obstruct the river, it is in vain that others abstain from abusing it. Thus by the maintenance of exceptions the law discourages those who are well disposed, and renders ineffectual voluntary combination, even upon a large scale, amongst manufacturers, to preserve the river. More than this, the law actually holds out a premium to those who abuse the river. A manufacturer is tempted to go on casting solid and liquid refuse into the river in order to establish a new right or to keep alive an old one.

The law prohibiting river abuse, when it amounts to a public nuisance, is not open to the same objection, because no length of toleration is held to justify a public nuisance. But the term "public nuisance" is a very equivocal one. In a manufacturing district no manufacturer is in danger of being indicted, still less of being convicted of causing a public nuisance, on the ground that the discharge of his dye waste renders the water of the river opaque, discoloured, unsightly, and quite unfit to drink, provided no smell is occasioned and there is no danger to public health. Again, in the neighbourhood of large towns it has come to be thought that a river foul with sewage is inevitable; inhabitants are reluctant to come forward as witnesses to denounce that to which they have become long familiar, and in like manner jurymen are slow to find such things to constitute a public nuisance. In the case of sewage pollution it is not usually difficult (as it is in the case of pollution from manufactory refuse) to trace the offence home, but, however serious the evil, it is very difficult to find a prosecutor. For the principal offenders are the governing bodies of large towns. These do not prosecute

* See a case decided by Lord Justice Cairns, reported in the "Times" of July 31, 1867. Appendix No. VIII., p. lxix.

one another for the reason that each is guilty of the same offence towards his neighbour, and they are rarely prosecuted by private persons because few are willing to bear the expense and odium of acting as public prosecutors. To institute legal proceedings against a large town with a view to compel it to adopt a different mode of disposing of its sewage, at a cost perhaps of many thousand pounds, is to provoke a wealthy adversary to a conflict in which every step will be contested. The expense of such a litigation generally far exceeds the value of the personal interest of any individual in the stoppage of the nuisance. Accordingly, whatever the inconvenience to the public, the nuisance continues unabated. Rich and poor alike submit to it as to a sort of destiny.

From these public nuisances, injury often of an unexpected character results to individuals. Two instances may be cited from those which, in the course of our inquiry, have been brought to our notice. Through the grounds of a Mr. Wood, situated on the outskirts of Pontefract, and in front of his house, runs what until recently was a clear pure stream of water. Two years ago the Street Commissioners of the town commenced to discharge sewage from the northern part of the town into this brook, and the result upon the brook where it passes through Mr. Wood's ground, is not only that the water is foul, but that the putrid deposits brought down by the stream choke up the channel and occasion a nuisance. From this nuisance Mr. Wood has no appeal except to law, and in aggravation he last year received a notice from the Mayor of Pontefract calling upon him to clear out "the offensive drain."

The other instance is that of the Bradford Canal. Bradford Canal is fed from Bradford Beck. The beck is deeply polluted by the sewage of the town, and the polluted water, when passed into the canal and ponded up in a stagnant condition, becomes a nuisance. The corporation, though recognizing the nuisance to be very serious, have abstained from taking proceedings against the Canal Company, doubtless feeling that the town and not the canal was to blame in the matter. However, the nuisance became so intolerable, that some individual townsmen have combined together, and by private subscription have instituted proceedings against the Canal Company. The Queen's Bench has pronounced that the Canal Company, whatever may be their statutory rights to draw water from the beck, are not justified in causing a public nuisance. And the Court of Chancery has issued an injunction, which practically prevents the Canal Company from drawing from the beck, whilst the beck is in its present polluted condition, and in consequence of which the canal has been in disuse since the 1st of May last.

Conclusions.

Where manufactures have been established and a large resident population has grown up as before stated, the greatest amount of pollution takes place, the area of country over which such form of nuisance is spread having no defined boundary other than the dividing ridges of such watershed and the shores of the sea. In order to prevent the Pollution and legally control the Management of rivers, their basins or watersheds must be placed under supervision irrespective of any arbitrary divisions of County, Parish, Township, Parliamentary, Municipal, or Local Government Act boundaries; or, indeed, of any artificially established division. Running waters flow on from their source to the sea, and if the upland waters are polluted by town sewage and by refuse discharged from manufactures, as in the West Riding of Yorkshire, the entire length of a river is necessarily polluted, and will require to be Conserved or protected. Towns situated midway or on the lower branches of rivers, as Leeds, Manchester, Salford, and many other places, will establish and carry out local improvements, and would clarify their sewage and other refuse fluid to little practical purpose, if the towns, villages and manufactories on the same river with themselves and its tributaries are not placed under restrictions against sending down pollutions. This state of things applies equally to villages and even to single mills and factories as to large towns: it prevents local authorities, as also manufacturers, from taking up the question of separate purification. Thus, for instance, the Corporation of Salford, which occupies one side of the river Irwell opposite Manchester, entertained the idea of intercepting sewers. Plans were prepared and estimates made, and the project was discussed, but was abandoned on the plea that money expended in Salford alone on such works would not accomplish the purification of the river Irwell so long as Manchester and all the great manufacturing towns and mills of Lancashire, situated on the river and its tributaries, continued to pollute the running waters of their respective

districts. Some towns have been placed under restrictions as to river pollutions by solids, and have been required to abate the intolerable nuisance caused, as at Birmingham and at Blackburn, where depositing tanks are at work; but in neither case is the requirement equitable, these towns being made the scapegoats for offences by no means confined to themselves. The river Tame, which flows through Birmingham, receives the pollutions from towns, mines, and manufactories situated above it on the South Staffordshire iron and coal-field. Blackburn in like manner, though in a much less degree, receives pollutions from manufactories beyond its area. Pollutions caused by sewage and by trades and manufactures ought, in our opinion, to be prevented, *at the cost of the communities and persons causing such pollutions.* At Croydon, at South Norwood, and at some other towns, it has been forbidden by injunction for the local authorities to pass town sewage into running waters below a defined standard of purity, and the result has been, after the failure of all other systems, a clarification of such sewage by irrigation, which not only proves successful for the purpose desired, namely to prevent river pollution, but in its operation is a source of profit to the ratepayers. However that be, the question of profit or loss in abating nuisances and in preventing either the undue pollution of the atmosphere, running waters or the seashore by town and house sewage, or by working mines and carrying on trades and manufactures, ought not too closely to be taken into account, as in some cases restrictive measures rigidly enforced would result in profit, whilst in others there might be a small loss, if that can be fairly called loss which is more than compensated by gain to the community. Towns can as well afford to pay for the means and appliances necessary to render sewage innocuous to running waters, as they can to pay for the sewers and drains which are necessary to their sanitary well doing. We have explained in this report that abuse and pollutions of running waters are of wide extent and affect entire watersheds, so that it may be inferred that any useful remedy must be capable of being applied as widely as the pollutions extend. Some districts are notoriously more polluted than others, as, for instance, those which we have just visited where the great woollen and worsted trades are established; there the abuses and pollutions of running waters have become almost intolerable, and even trade is seriously injured in consequence. The long catalogue of pollutions and of floodings, as set forth in the evidence and in the appendix to this report, indicates the extent to which such abuses may further grow if left uncontrolled. Every witness we examined admitted the existence of many great evils, and remedial measures are in the evidence over and over again suggested, the reiterated stipulations being, that such measures shall be as general as the trades to be affected by them, and that their enforcement shall be by Government authority.

One conclusion, therefore, forces itself upon anyone who honestly deliberates upon the existing state of things in regard to the rivers we have visited with a view to its permanent improvement. A stronger power than has hitherto been available must be brought to bear if the present abuse and pollution of streams is to be arrested, and Government supervision and inspection must enforce and strengthen the action of local authorities.

As previously mentioned, there is plenty of land in the Aire and Calder district suitable for sewage irrigation, and we have no experience of any town or locality where the application of that system would be impracticable. Should there be any place so exceptionally situated that the benefit of this system could not be secured by reasonable outlay, there the entire sewage should be so treated by mechanical deposition, aided by any available chemical process, that no portion of solid matter in suspension should pass into the streams, and that the effluent water should be as free from organic impurity as the best known method can make it.

All refuse from dyeworks, mills, factories, tanneries, breweries, malthouses, slaughterhouses, and the like, should be prevented from being cast into and polluting running waters.

No ashes, cinders, slag, waste-earth, mud from canals goits and reservoirs, road-scrapings, broken pottery and utensils, bricks and building rubbish, or any other solid calculated to impede the flow of water, raise the bed of the stream, or cause impurity, should be permitted to be cast in or so to be disposed on the banks of a river as to be carried in by its waters.

No water that has been used in washing, scouring, milling, fulling, &c., wool and woollen goods, should be allowed to pass into any running stream until all oil, grease, suspended matter and dirt, has been removed from it.

Water containing colouring matter from dyeing should be clarified, with or without chemical aid, by ordinary subsidence, by filtration through ashes or sand, or by

mechanical filtration as Needham's press, before being allowed to flow into any running water or river.

Ochrey water from coal workings, which is highly objectionable to manufacturers if passed direct into running waters, may be greatly improved by mechanical deposition and should be so treated.

We do not consider it desirable to define the exact modes of treating dye-waters and other waste products of manufacture, solid and fluid, as the modes of operation vary at different places. The cheapest and best mode at one place might not in any way be equally applicable at others; but the prohibition against the practice of casting in solids *may at once be general without any exception.*

Sewage interception is always practicable. Where it can be applied fresh to the land there is least nuisance and least cost to the ratepayers. Where the solids are extracted by mechanical deposition, there is pecuniary loss on the operation, and running streams receiving the effluent water are still polluted, the pollution being greater as the volume in the stream is relatively small. No arrangements for treating sewage are satisfactory except its direct application to land for agricultural uses.

It is for the interest of manufacturers as well as of riparian owners and the community at large that a preventive law should be equitably but rigidly applied. For such legislation the successful operation of Lord Derby's Act which has abolished the nuisance from alkali works affords a fitting and encouraging precedent.

We have shown in this report how, with advantage to all parties, the main elements of river obstruction and pollution in the West Riding of Yorkshire may be eliminated; it will be our duty to inquire in districts specially affected by other trades or by mining, whether there exist any obstacles, which we do not at present anticipate, to such a general system of River Conservancy for the country at large as suggests itself as most desirable for local application to the valleys of the Aire and Calder.

Our experience of the weakness inherent in unaided and uncontrolled local authorities as at present constituted convinces us that a central board appointed by a State department is necessary to the efficient protection of running waters. For instance, under the Local Government Act, 1858, a Local Board may be established; and, after having executed works on borrowed money, the ratepayers may decline to elect a board, or the members of such Local Board, after election, may decline to act, there being no power in the Home Office to compel them to do so: such power, however, will be absolutely necessary in any Conservancy Act, to enforce the prevention of river pollution.

Economy in the working of a central board for the conservancy of rivers might probably be obtained by enabling it to avail itself of such parts as may be applicable of the existing system of Government inspection, as of factories, mines, alkali works, fisheries, land drainage, &c.

In respectfully submitting this suggestion for the establishment of central authority we would guard ourselves against being supposed to ignore the sentiment which exists throughout the country in favour of local representative bodies, with power to levy and control such rates as may be sanctioned, and to perform all necessary works within their respective neighbourhoods.

Essential to the wellworking of our plan would be the parcelling of river basins into conservancy districts or areas and sub-areas, larger in agricultural districts where the duties would be light, by grouping together several river catchment basins, and smaller in manufacturing and mining districts where river pollutions and obstructions are more general and numerous, and where the operation of local boards and their officers would be more frequently required.

The duties of such central and district conservancy boards might be,—

1. To aid the Salmon Fisheries Commissioners.*
2. To prevent the obstruction of rivers and running waters by casting in of solids or flushing in of mud, as also all forms of river pollution.
3. To take cognizance of all existing weirs, mills, dams, river-walls, embankments, reservoirs, goits, culverts, drains, &c., and of any new works proposed which may affect streams.
4. To hear appeals in cases of local dispute as to works of any character affecting the condition and free flow of rivers.

* See Mr. S. Walpole's first report, enclosing answers to questions submitted by Mr. Ffennell with regard to pollutions among other injuries to fisheries. (*Sixth Annual Report of the Inspectors of Salmon Fisheries, ordered by House of Commons to be printed July* 15, 1867, 440.).

With this report we publish four sketch maps, intended to explain our suggestions in reference to the district of the Aire and Calder, together with tables of its area and population, and statistics of the local manufactures in which water is used and polluted.*

1. Sketch map of the basin of the river Ouse, showing the combined sub-area of the rivers Aire and Calder.
2. Geological map of the Aire and Calder basin, reduced from Professor Phillips' "Geology of Yorkshire."
3. Sketch map of the basin of the rivers Aire and Calder, divided into ten suggested sub-conservancy districts, each being a complete sub-catchment basin, having a principal town within it.
4. Sketch map of the drainage area of the river Colne and its tributaries (above its junction with the river Calder), having Huddersfield as the principal town in this watershed.

Our views upon the important question of the prevention of the pollution and obstruction of rivers will, we trust, as far as the valleys of the Aire and Calder are concerned, be sufficiently evident from the general tenor of this report and its concluding paragraphs.

As we are now, in obedience to Your Majesty's Commission, about to visit rivers specially polluted by other manufactures and by mines, we respectfully reserve the absolute recommendations which would appear to be in this place due from us, partly in deference to the express objection on the part of West Riding manufacturers, to any legislation which should not also be enforced upon the textile trade of other districts, and partly in the hope and expectation that, by postponement of final judgment to experience of other pollutions and localities, our Recommendations will be more valuable and more capable of general application to the improvement of the rivers of England.

All which we humbly certify to Your Majesty under our hands and seals.

APPENDIX.

APPENDIX No. I.

Floodings in the Rivers Aire and Calder Valleys, November 1866.

The following account of the disastrous flood which took place on the rivers Aire and Calder during the month of November 1866 is abstracted and condensed from local reports.—

On the 15th and 16th of November 1866 a general heavy rain commenced on the mountain ranges extending from Durham to Derbyshire, upwards of four inches of rain falling in some places during forty-eight consecutive hours. The Cal and the Der, united at Todmorden, rose above their banks and flooded houses and mills, Railway trains were stopped betwixt Todmorden and Manchester. In the flat district of the town cottages and mills stood in the midst of a vast sheet of water. The flood carried down sand, gravel, and ashes to spread them over land and gardens on both sides of the river below, spoiling the crops in many hundred cases. At Hebden Bridge roads, mills, and houses were flooded; women and children had to be removed by means of ladders from windows to escape drowning. The Hebble valley and the Black Brook valley were flooded and much damage suffered. River-side premises, cellars and houses were all under water; furniture and even provisions were floating about; sick people had to be removed in blankets; women carried their children to places of safety; fear and anxiety was expressed on every countenance. The manufacturers had many things which would float carried away, besides the damage done to buildings, machinery, and goods. At Huddersfield the rivers Holme and Colne, which have their junction at Folley Hall, were swollen to a great extent. A report was spread that Damhead reservoir had burst; this, fortunately, was not the case; adjoining lands, to the extent of many acres, were under water. Queen's mill was surrounded with water and flooded to such an extent as to imprison the workpeople for several hours. Riverside premises, roads, streets, yards, mill floors, cellars, and basements of shops and cottages were flooded so as to cause much damage and consequent loss. At Lockwood, the river Holme was in flood, and did much damage down the valley; at Dungeon mill, yards and mill floors were under water, and fires were extinguished; the water rose as high as at the bursting of the Holmfirth reservoir; fields and gardens were laid under water, and portions of river-wall washed down; the carriage road to Messrs. Bentley and Shaw's large brewery was two feet under water; the several large mills on the banks of the river were more or less flooded and injured; weaving-sheds were inundated, machinery and goods destroyed to a considerable value; steam-boiler fires were put out, and the mills had to cease working for several days, causing loss in wages to hundreds of working people. Lockwood baths were so much inundated that the occupants had to be removed. At Netherton the flood did much damage. At Bierley, part of a mill-dam was washed away. At Luddenden, mills and cottages were flooded, goods and furniture were damaged. At one mill a window had to be broken to remove a female from the interior. At Luddenden Foot, river-fence walls and railings were broken down; mill and shed floors were swamped with water and much damage done; timber, furniture (a chest of drawers), carcases of pigs, and other things were floated down the river. At Ripponden there had been river-walls built in places, but where no such protection was afforded, premises, mill floors, and cottages were flooded. Treadmill Bridge—a footbridge—was carried away, and four persons, a mother and three children, were drowned. At Sowerby Bridge the flood in the Calder rose higher than on any previous occasion, so that land on both banks, cellars, dwelling-houses, mill-floors, and yards were all flooded, causing great damage and loss; the flood carried down timber, tubs, barrels, carcases of pigs, and many other things; the gasworks were so flooded as temporarily to prevent the district being lighted until the waters subsided. In the holmes west of Sowerby Bridge much damage was done by the flooding of weaving-sheds, mill-floors, yards, and the basements of houses; looms, carding-engines, and other machinery were damaged, some piles of twist and pieces of cloth were washed away and others damaged. Prior to the erection of the new mills above the bridge inquiries had been made as to the range of floods, and the floors were thought to have been placed above this level, but this flood rose more than three feet higher than any one previously recorded, hence the flooding and loss. At Copley the river Calder flooded large areas of land, and caused much damage. At Sterne mill the basements were flooded to a depth of two feet six inches; all the holmes by the river side were covered with sand and mud; garden allotments were partially destroyed; the National School was flooded; boundary walls in fields parallel with the river were thrown down, and, in some cases, the stones were washed away. At Elland West-Vale the flood waters rose to the top squares of the windows of the old mill; and large quantities of goods were washed away and machinery damaged; large areas of farm land belonging to Major Waterhouse, M.P., were flooded and seriously damaged, by being covered with sand, silt, and rubbish washed on and deposited by the torrent; all down the course of the river great damage to land, mills, and other property was caused. At Brookfoot and Brighouse the land in the valley was flooded; further down the river the floors of new mills and new houses were placed under water. Broad Holme mill was flooded and much loss occasioned, the waters rushing across gardens and fields; many houses were inundated at Messrs. Sugden's old mill; horses had to be removed from the stables; Daisy-Croft, Mill Lane, and Clifton Bridge were flooded; in Bethel Street houses were flooded, fires were put out, and furniture floated about; at Victoria mill silk-cording engines were spoiled by water. Low mill, standing at the junction of the river and canal, was flooded to the ceiling, a water-wheel was smashed, soap and soda-ash melted, and blankets washed away; walls were washed down, the canal banks were injured, and a canal boat was carried on to the surface of the land, where it remained high and dry; at the Calder Dyeworks, vats and goods were damaged, and one house was swept away; at dyeworks belonging to Messrs. Burgess fires were put out, and much damage done; the mill belonging to the Messrs. Sugden had the entire length of river-wall carried away, as also a new house built for the engineer. At Mirfield the damage was very great, mill-floors, shops, and houses being flooded; canal boats were swept out of a building yard; a new branch railway was seriously damaged; six persons were drowned in attempting to drive over a bridge, and one man was washed out of the saddle and drowned in attempting to cross. In Dewsbury a dissenting chapel could not be used, and at the parish church the galleries only could be occupied, the floor of the church having been flooded more than three feet in depth; a blanket manufactory and bleaching-houses suffered much damage, a large number of finished blankets (part of a Government order) being damaged; some houses were swept away. In Calder vale, from the Dewsbury side to Thornhill, the damages were estimated at 100,000*l*. Uprooted trees, pigstyes, cowsheds, haystacks, and other floating wreck came down with the torrent of water. The damage at Wakefield was very great. Nearly every mill in the district had to cease work, the

corn warehouses and their contents suffered much injury ; pigs, cows, geese, and ducks were washed away. The Aire and Calder navigation works were seriously damaged, corn and grocery goods in the warehouse being destroyed; two barges were carried over the dam stakes ; the traffic between Wakefield and Manchester was stopped for several days and eight boats sunk at Hosbury cut. The losses in damage to buildings and property of various kinds amounted to several thousands of pounds.

In the valley of the Aire, along its whole course, damage was done to an extent as great as in the valley of the Calder. At Skipton the banks of the Leeds and Liverpool canal behind the castle were damaged, the reservoir was damaged, and 20 sheep were drowned. Near Cononley cattle were drowned ; at Bingley a wooden bridge was washed away ; at and below Keighley the valley looked like a vast lake ; near Dalton Mill much damage was done ; in the valley of the Worth there also occurred much damage from flooding; as the Aire received the flood waters of the various tributaries it became more terrible in its force and more destructive ; at Bradford, main sewers and the low parts of the town were flooded ; surface of streets being placed from four to five feet under water, having the appearance of rivers ; the Bradford and Leeds Railway was flooded in several places; on the Midland railway, at Esholt, near Apperley Bridge, a large stone viaduct of 10 arches was swept down with an engine and goods train upon it at this point ; the valley is wide and open ; if the foundations of the viaduct had been carried to a sufficient depth no such destruction would have taken place. The cost to the railway company in delay of traffic, and in reconstruction of the viaduct, must have been very great. At Leeds, quays, wharfs, and many streets, warehouses, shops, and dwelling-houses were flooded, in some places six feet deep ; boats were employed in the streets to remove persons from their deluged houses, or to convey light, fire, and provisions to those who preferred remaining in their chambers until the flood should subside. Barges were carried from their moorings and sunk against Leeds bridge, and several persons were drowned by the breaking down of a balcony passage above the same bridge. A tall chimney was undermined, and fell across some houses, destroying them ; the money losses in Leeds caused by this flood must have been very great ; individual losses were in some cases upwards of 1,000*l*. At Castleford the main streets were partially under water, houses were flooded, large breadths of land on both sides of the river were inundated, and boats were drifted away. In Wharfdale the lowlands were all flooded, roads rendered unpassable. At Otley a farmer was drowned ; near Ulleshelf thousands of acres were under water, and for two days imperilled the traffic of the North-Eastern Railway. From near Grimston upwards of 150 sheep were washed away. The total loss was locally estimated at from half a million to one million sterling.

APPENDIX No. II.

REPORT by Captain ARMYTAGE, Governor of West Riding Prison at Wakefield, on the use of EARTH-CLOSETS in SEPARATE CELLS of PRISONERS.

To the Rivers Pollution Commissioners.

West Riding Prison, Wakefield,

GENTLEMEN, 20th July 1867.

IN reply to your letter of the 1st instant, requesting me to give the result of our experience in working dry-earth closets in this prison, I beg to inform you that we have about 100 in use in cells which have not been provided with watercloset, and we are perfectly satisfied with them.

We do not, however, permit the prisoners to make water in them, but each prisoner is provided with an earthenware vessel for that purpose which is emptied every day. Had we not been so much engaged of late we should have had more earthclosets in use, as it is our intention to place earthclosets in all the cells in which waterclosets have not been provided.

I have, however, strong doubts about the earth-closets answering in the women's department. We shall try them, but I anticipate a failure.

We have about 740 waterclosets in use in the new prison (built in 1847) and (excepting in a few instances) the rest of the prison is without.

We pay a royalty of 2*s*. 6*d*. to the patentees for each earthcloset we make.

The cost, including royalty, may be roughly put down at 25*s*. each.

The only expense of maintenance would be in replacing the galvanised iron pan or scuttle when necessary. This would entail a cost of about 2*s*. per annum.

Probable annual cost of maintenance: One prisoner would be able to attend to the drying of the earth for any number of earthclosets up to 800. His labour and the cost of fuel for drying would not amount to more than 10*l*. or 12*l*. The cost, however, would materially depend upon the facility with which the earth could be obtained and the conveniences for drying. I should at present estimate the value of the soil after being once used at 10*s*. per ton. It seems to answer well for hand-dressings for grassland, onions, and potatoes.

In reply to your second question, wishing to know my opinion of the earthclosets as compared with the watercloset system, I think it best to let the present waterclosets remain and supply the remainder of the prison with earthclosets, and, by the time the present deficiency is made up, we shall be better able to form an opinion as to the advisability of replacing the waterclosets that get out of order with earth ones. Until such time I think it would be premature to consider the earth system as more than an experiment. The medical officers here do not object to the earth-closets, as they consider them far preferable to the pots the prisoners previously used.

You ask which system I would prefer in case it were made compulsory that the excrements of the prisoners should be kept out of Westgate Beck. You must be under a mistake in asking this question, as we have no drain from the prison into other than the large town drain, which has no connexion with Westgate Beck.

(Signed) G. ARMYTAGE, Governor.

CHINESE AND JAPANESE MANURE STORING AND FARMING.

In tropical climates moisture and heat promote fermentation to such an extent that refuse of all sorts rapidly becomes putrid, offensive, and dangerous to health. In India the natives go beyond the precints of their dwellings as did the Israelites during their sojourn in the wilderness. In China and Japan, manure is collected and stored by the inhabitants until it becomes putrid and offensive. The process is described in the following manner : "Both in towns " and in the country there are numerous receptacles " exposed for preserving the odious compounds until " wanted, on the highways at frequent intervals so as " to render such roads almost impassable to people " afflicted with the sense of smell, making it difficult " to get a fresh walk from one end of the land to the " other, unless it be on the edge of the craters." Sir Rutherford Alcock, K.C.B., states in a narrative of a three years' residence in Japan—"Exercise in the " country in China throughout the year, had this " terrible drawback of stink attached to it. In Japan, " except in spring, during the months of March and " April, there is little of the manuring to complain of. " The vegetables grown under the excessive manuring " are, however, either rank or tasteless, and their fruit " is no better; the cause may probably be in seed,

Edward Stanford, lith. 6 Charing Cross.

" soil, and climate. It is stated of Japan, that " amidst great natural beauty and fertility the birds " have no song, the flowers have no scent, and fruit " and vegetables no flavour." Agriculture in Japan is encouraged to the utmost, much of the land is a light friable loam easily worked; in the valleys irrigation is provided for and the hills are terraced to a considerable elevation. Cropping and rotation of crops are thoroughly understood by the Japanese.

Rice is the staple food of the whole population and it is grown abundantly over the country generally wherever the nature of the soil will admit the possibility under the strongest compulsion of unwearied labour, irrigation and manuring combined. The water required for irrigation is plentifully supplied by the streams and rivulets to be met with in all directions. The Japanese farmer keeps his farm scrupulously free from weeds, neat, and in good order. Men, women, and children may be seen in the fields early and late. The manure in use is urine and night-soil. The farm labour is chiefly manual—a plough drawn by bullocks or ponies is used sometimes, but generally speaking mattocks and hoes are the implements by which the land is prepared and every part of the field labour performed.

R. R.

APPENDIX No. III.

The following description of Sewage irrigation works at the Somerset County Lunatic Asylum, together with plans of same, were furnished to the Commission by Arthur Whitehead, Esq., C.E., County Surveyor :—

SOMERSET COUNTY LUNATIC ASYLUM, SEWAGE IRRIGATION, June 29th, 1867.

DESCRIPTION of the PLAN adopted in the year 1848, and still in operation, at the Somerset County Lunatic Asylum, for utilising the Sewage of the Establishment.

1. The number of inmates of the asylum, including attendants, is at the present time 550.

2. The water supply is taken off from a stream in the valley, at a sufficiently high level to fill by gravitation the reservoir shown on the drawing, and the consumption for every household purpose is about 50 gallons per head, or 27,500 gallons daily.

3. Three-fourths of the rain water falling on the roofs and airing yards is intercepted and stored in tanks for household use, and the remaining one-fourth is discharged through the sewage drains into the sewage tank by gravitation.

4. The sewage drain, having its outfall in the sewage tank, communicates with the waterclosets, the baths, the laundry, the lavatories, and the kitchen, and with the roof: these were the arrangements made originally by the architect in the year 1846; since that time the superintendent, Dr. Boyd, has collected the rain water from three-fourths of the area of the building and yards, and utilised it for the laundry, the brewhouse, and for the house generally.

5. The lands on which the sewage is utilised are coloured red on the plan; the soil is "dolomitic conglomerate," and of the whole quantity (18a. 1r. 27p.) 13a. 3r. 28p. are arable, and 4a. 1r. 39p. are old pasture land.

6. The sewage tank is an ordinary brick-built chamber 15 ft. × 15 ft. × 18 ft., and the delivery drain is of brick, 4 ft. × 2 ft., and iron pipes convey the liquid from the upper arable land to the two fields on the other side of the road.

7. The application of the sewage to the land is managed by means both simple and inexpensive: shafts, in 4½ brickwork, are built at intervals along the main delivery drain, as shown on the plan; each shaft is provided with a "hatch" working in a frame, by means of which the sewage may be intercepted and made to overflow at any of the several shafts along the course of the main delivery drain.

8. By the kindness of Dr. Boyd, the medical superintendent of the asylum, under whose advice this work was done nearly 20 years since, I am enabled to record the following results :—

a. There has been no manure but sewage used on No. 4 piece of the arable land for 19 years; the quantity of cabbage, mangold, and Italian ryegrass grown on it each year is very large; cabbage frequently weigh 56 lbs., and some have been cut weighing as much as 70 lbs.; the roots of mangold weigh from 17 lbs. to 23 lbs., and the Italian ryegrass has been cut four times between March and October, and seeded once; the produce per acre is 50 tons, and the land shows no sign of depreciation. The sewage has been extended more recently to the other two pieces of land with similar success.

b. As to the effect in a sanitary point of view, I can state nothing so satisfactory as the words of Dr. Boyd himself, recorded in one of his recently published reports. He says, "No unpleasant " odour is at any time perceptible from this " sewage, unless by going close to the tank or " shafts, and by the time the sewage has passed " off into the ground, a few feet distant, it is " deodorised." I have myself, this very warm day, walked over the land over which the sewage was flowing, and I am able fully to confirm this statement of Dr. Boyd's. Again, to quote Dr. Boyd's report, "No ill effects, as regards " the health of the patients or others in the " establishment, however, occurred from the " sewage; the apartments of the superintendent " are nearest to the sewage tank. It has been " stated that in one asylum where the sewage " was used on the land, several fatal cases of " dysentery had occurred, which were attri- " buted to this source. It is probable that " other causes may have been overlooked, or " that the nature of the soil is such that it " requires to be broken up, if impervious, to " deodorise the sewage. If irrigation with the " sewage were the sole cause, it is most likely " that disease would have occurred here in the " course of 18 years, but neither dysentery nor " fever have, thank Providence, ever prevailed. " Nearly all cases have been carefully examined " after death, and notes of the post-mortem " appearances, in each case, given in the annual " reports."

9. Much of the work having been done at intervals, the cost of it cannot be given with accuracy, but the expense of the tank, delivery main, shafts, and fittings would not exceed 70*l.*, and the working expenses are almost nil.

10. I believe that, with some modifications and inexpensive alterations, we shall obtain better agricultural results on our farm. In a sanitary point of view the medical testimony is most satisfactory, and I think the Chairman of the Committee of Visitors would be willing to confirm these statements.

11. There is no reason whatever why the utilisation of sewage should not proceed *pari passu* with the generation of sewage; under no circumstance can it be anything but a question of expense; under some circumstances it is clearly a question of profit; under all circumstances it is a question of true economy.

(Signed) ARTHUR WHITEHEAD, Civil Engineer,
County Surveyor of Somerset.

APPENDIX No. IV.—SEWAGE IRRIGATION.

List of Questions relative to Sewage Irrigation, submitted by the Rivers Pollution Commissioners to the County Surveyor of Durham.

County of Durham.—Sedgefield Asylum Irrigation, 1867.

Answers to Questions contained in a Letter from the Rivers Pollution Commission, dated July 1st, 1867, a Copy of which is prefixed to this Report and each Question numbered.

1. Ground plan of the county asylum, and of the land irrigated with sewage and waste-water from that establishment, as also other information relative to population, &c.?

1. A plan is enclosed showing plot A, containing 10a. 0r. 37p. of old grass land to which the sewage was applied in the year 1863, with metal piping and hydrants or standpipes, shown thus, —⊕— , from the collecting-tank F. by gravitation; plot B, also old grass, containing 11a. 2r. 35p. to which the sewage was applied in the same manner by the same means in the year 1864; plot C, of garden and ground, containing 9a. 3r. 33p., to which the sewage was applied in the year 1864, by pumping from the tank F, by an engine (used for many other purposes in the workshops G.); these pipes and hydrants are placed much nearer than on the grass-land, on account of not damaging the crops by the moving of the hose, (used in all cases for distributing the sewage on the land); plot D, containing 13a. 3r. 14p. is arable land, and the sewage is proposed to be applied to this plot as well as to plot E, containing 20a. 2r. 18p. of old grass, at some future time, by gravitation and metal pipes, as applied to plots A and B.

2. Number of persons whose sewage is dealt with?
3. Volume of water used per head?
4. Volume of surface water admitted into sewers?
5. Area of land irrigated?
6. Mode of applying the sewage?

2. Number of persons, 503.
3. About 25 gallons per head.
4. None.
5. 32 acres, nearly.
6. By metal pipes, fitted with screw-caps as plugs, at the distances apart shown on the different plots thus —⊕— ; the whole sewage is shut off from access to the pipes by a 4″ valve at the tank, and when so shut off the hose can be detached from one plug and attached to another, and when so fixed the valve re-opened till the whole land has been brought under the scope of the hose and so irrigated.

7. First cost of irrigation works?

7. The cost of irrigating plot A was per acre, 11*l.* 7*s.* 4*d.* Plot B 8*l.* 15*s.* 0*d.* per acre. * Plot C 14*l.* 0*s.* 0*d.* per acre (including pump and section pipe).

8. Annual cost of management of sewage?

8. The sewage is applied by the patients under the direction of the farm steward, and there is no cost except the keeping in repair the hose, which is a mere trifle.

9. Description of crops grown?
Value of do.?

9. The crops grown on plots A and B are old grass used as pasture a portion of the year, and meadowed afterwards; these fields before being irrigated produced very poor crops, indeed almost nothing, but now produce at the first crop (after only having been freed as a pasture for six weeks) as follows:

Plot A produced 3 to 3½ tons of hay per acre, and plot B, 2 to 2½ tons; another crop will be got off each, which will probably produce on plot A a ton and a half, and on plot B one ton per acre; the fields are after this pastured by sheep till the May following. According to these crops the value of the produce will be about as follows:

Plot A (say average) 4½ tons	£	*s.*	*d.*
of hay at 6*l.* - -	27	0	0
Pasturage, say - -	1	10	0
Per acre	£28	10	0

Plot B (say average) 3¼ tons	£	*s.*	*d.*
of hay at 6*l.* - -	19	10	0
Pasturage, say - -	1	5	0
Per acre	£20	15	0

The produce of Plot C, the garden ground is most remarkable, and is spoken of by everyone in this neighbourhood acquainted with agriculture; the produce is principally consumed in the asylum, but of late years, since the sewage has been applied, a great quantity of surplus garden produce has to be disposed of to parties coming with their carts a distance of 10 to 12 miles, and purchasing the same for re-sale at the different markets and colliery villages.

The crops that seem the most benefited by the irrigation are as follows:

The cabbage tribe,
Celery,
Turnips,
Rhubarb,
Beans, &c., &c.

In fact vegetables of every description where sewage is applied are at all times most luxuriant and productive, and when the sewage, for any reason, is not so applied they at once slacken in their growth, and in a few days (only a narrow walk dividing the compared plots) are nowhere in the race.

As an instance of the value of a crop of cabbages now on the ground they are being sold wholesale to parties leading them 10 or 12 miles to the adjoining towns (and they then re-selling them) at the rate of 100*l.* per acre, *i.e.* at 12*d.* per dozen, they are re-sold at 18*d.* per dozen, or at the rate of 150*l.* per acre.

By proper rotation of garden crops, from 1¼ to 1½ crops may be got off the land per annum, so that the produce of each acre per annum will be equal in value to from 180*l.* to 200*l.*

The land irrigated is a free working loamy soil, overlying 10 or 12 feet of sandy porous gravel.

Durham, July 19, 1867. (Signed) William Crozier, M.I.C.E.

APPENDIX No. V.

Blackburn Sewage Outlet Works.

The following description of the sewage outlet works at Blackburn, together with the accompanying plans, were furnished to the Commissioners by Joseph Brierly, Esq., C.E. :—

Blackburn, September 14th, 1866.

The value and the necessity of a sufficient and proper arrangement of "storm outlets" has been proved here during the past month; heavy rains have ested the sewers, and the main outfall 6.0 × 4.0 has been surcharged, shooting out its contents at full bore, and with immense force. By proper attention to the "storm outlets" all danger and inconvenience has been avoided.

The tanks are constructed on the Worksop model, —open trenches with brick or stone bottom and sides. They were set to work three weeks ago, and are now being emptied. In this period of time there has been accumulated (and arrested from flowing into the river) a quantity of solid refuse and sewage matter, estimated at 160 tons, consisting of road grit, the varied ejects from dwellings and W.C. refuse. This must form a very rich manure, and will be sought after.

I have carefully watched the working of the tanks with much interest.

The effluent water was not so clear as could be desired, but still the fact of arresting 160 tons of solid matter in three weeks, or at a rate of about 2,700 tons per annum, shows what has been done towards improving the river, and I have no doubt that the additional means of filtration, &c., which I have shown on plans, and which are now being fitted up, will very much improve the condition of the water as it leaves the tanks.

(Signed) Joseph Brierley, C.E.

APPENDIX No. VI.

Previously to framing our report, we requested from about 60 of the leading manufacturers answers to the following queries. We received 28 replies, the substance of which are tabulated in pages

Rivers Pollution Commission.—Inquiry into the state of the Rivers Aire and Calder and their Tributaries, 1866-67.

Queries relating to the Woollen and Worsted Trades.

1. About what weight of wool do you use in a year ?
2. How much of this wool do you wash ?
3. Do you use soap or alkali as well as urine in washing the wool ; if so how much ?
4. How much water in gallons is used in washing ?
5. About how much wool by weight do you dye, and what colours principally ?
6. About what value of dyestuffs do you use annually ?
7. What quantity of water do you use in the dye vats, and where does the waste water flow ?
8. Do you put oil to the wool before working it, and if so, what oil and about to what value per annum ?
9. About what weight of waste wool do you produce in carding, and what becomes of it ?
10. Do you wash the goods ? and if so, do you buy or make soap ? About how much, and to what value per annum ?
11. What quantity of water do you use in washing the goods, and what water, river or other water ?
12. Are the soapsuds made on your works treated for recovery of grease ? and if so, by yourself or by a contractor ?
13. What do you gain by the extraction of the grease ?
14. Are the whole washings treated, or only the first flow ?
15. Does the water from the grease process pass away clear, or how nearly so ?

The answers are tabulated, pp. lxii—lxvii.

Nearly 343,000, the bulk of the wool used here having been washed at the other works in the borough of Halifax, and included in answers given from there.	343,000 lbs.	24,000 lbs. of soap, 10,500 lbs. of alkali. No urine.	5 to 600,000 gallons.	None -	—	—	—	—	—	—	—	—	—
3	Bates, John -	Dewsbury	350,000 lbs.	Spin wool unwashed. Scour and wash all wool produced.	No urine. About 15 tons of alkali and 3 tons of soap.	Unlimited: quantity not known.	290,000	+	+	+	+	+	+	+	+	+
4	Barker, R. H., & Co.	Wakefield	1,000,000 lbs.	Nearly the whole.	Soap, but not urine.	14,000,000 gallons.	280,000	+	+	+	—	—	—	—	—	—
5	Brooke, Henry	Huddersfield.	170,000 lbs.	127,000 lbs.	Use 8 cwt. of alkali.	About 300 gallons for 60lbs. of wool, that is 635,000 gallons.	About 115,000.	—	+	—	—	+	—	—	—	—
6	Brooke, John, and Sons.	Huddersfield.	In 1865 we used 506,500 lbs.; in 1866 we used 549,162 lbs.; in 1867, up to June, rather more than in the corresponding time of 1866. The average of three years, 535,000 lbs.	The whole	Soda occasionally used, but to a very small extent, and may be considered quite an exception.	About 78,000,000 gallons.	Nearly the whole quantity in wool or cloth is dyed on our premises.	+	+	+	—	+	—	—	—	—
7	Clay, Daniel -	Sowerby Bridge.	1,176,000 lbs. -	324,000 lbs.	38,400 lbs. of soap; 8,624 lbs. of ashes.	664,000 gallons	72,000	+	+	+	—	—	—	—	—	—
8	Clay, J -	Rastrick -	- - -	- - -	- - -	- - -	- - -	—	—	—	—	—	—	—	—	—
9	Clough, John -	Keighley -	750,000 lbs. -	660,000 lbs.	Soap and its equivalent in alkali and oil, but no urine; equal to 56,000 lbs. of soft soap.	Not known -	None -	—	—	—	—	—	—	—	—	—

NOTE.—The + in the above columns is placed opposite the names of the manufacturers and dyers to denote the colours they dye.

No. VI.

therein in the Towns of Bingley, Bradford, Dewsbury, Halifax, Honley, Huddersfield, Keighley, Leeds, Sowerby-Bridge, and Wakefield, with the Answers received as under.

6. What Value of Dyestuffs do you use per Annum?	7. What Quantity of Water do you use in the Dye Vats per Annum, and where does the waste Water flow?	8. Do you put Oil to the Wool before working it? If so, what Oil, and about what Value per Annum?	9. What Weight of waste Wool do you produce in carding per Annum, and what becomes of it?	10. Do you wash the Goods? If so, do you buy or make Soap? How much, and what Value per Annum?	11. What Quantity of Water do you use per Annum in washing the Goods, and what Water, River or other?	12. Are the Soapsuds made on your Works treated for Recovery of Grease? If so, by yourself or by a Contractor?	13. What do you gain by the Extraction of the Grease per Annum?	14. Are the whole Washings treated, or only the first Flow?	15. Does the Water from the Grease Process pass away clear, or how nearly so?
2,350*l.*	Waste water flows into river.	Yes. Gallipoli, 1,460*l.*	About 62,400 lbs. We work it up again.	Yes. Buy soap, about 17,000lbs., in value 280*l.*	Spring, but some of river water.	Yes, partly by a contractor.	30*l.*	Not entirely	Not quite clear.
None	None	Yes. Olive, 250*l.*	About 15,000 lbs. waste and sand or dust; the former sold, the latter used as manure.	Wash yarn. Buy soap about 7,200 lbs., in value say from 90*l.* to 100*l.*	300 to 400,000 gallons in washing the yarn. Spring water and water condensed from steam.	No	Nil.	—	—
1,200*l.*	470,000 gallons, waste water into river.	Yes. Rape, 450*l.*	50,000 lbs. Sold for manure.	Wash yarn. Buy soap, in value 260*l.*	Unlimited; river water.	No	The grease is not extracted.		The waste from all processes flows into river.
5,000*l.*	2,200,000 gallons.	Yes. Gallipoli, 3,000*l.*	35,000 lbs. Sold to waste dealers.	Yes. Buy soap, 89,600 lbs. in value 700*l.*	4,700,000 gallons; river water, part filtered.	Suds from yarn and worsted are so treated by a contractor. Suds from wool-washing are not, but flow into river.	About 100*l.*	The whole washings.	Not clear.
300*l.*	520,000 gallons, waste into river.	Yes. Gallipoli, 740*l.*	About 56,000 lbs. Sold to oil extractor and maker of artificial manure.	Yes. Buy soap, about 14,224 lbs. in value 214*l.*	Quantity not known; part from canal, part from bore-hole.	Yes, by a contractor.	30*l.*	Only the first flow.	The water does not pass away clear. It may be compared to the water in the vats during the second washing of the wool.
About 6,200*l.*, *i.e.*, about 4,800*l.* indigo, 1,400*l.* dyewoods and chemicals.	About 3,756,000 gallons, waste into river Holme.	Yes. Olive, 2,850*l.*	After reserving the best waste, say 3½ cwt., for our own use in manufacture, we sell about 15 cwt. of waste per week. Total waste per annum produced, 107,124 lbs. N.B.—This is carding waste only, not ends from subsequent process.	Yes. Buy soap, 40,320 lbs. in value 580*l.*	62,600,000 gallons. No river water is used. Three-fourths of supply from a bore-hole, and the remaining part from a stream flowing through our property.	Yes, by a contractor.	Nothing. The amount paid to us by the contractor is 55*l.*, but that is absorbed by the expense of steam, &c.	Only the first flow.	Not nearly so at all.
3,000*l.*	70,000 gallons, waste flows into river.	Yes. 14,500 gallons, 3,020*l.*	51,800 lbs. of the best sort sold for mixing with the wool again, 80,640 lbs. of the lower sort sold to a grease extractor.	Yes. Buy soap 35,840 lbs. in value 480*l.*	75,000,000 gallons; principally river, but spring water when we can procure it.	Yes, by a contractor.	About 150*l.*	Only the first flow.	Pretty clear.
The value of the dye stuffs will not exceed 500*l.* Most of the valuable colours are dyed elsewhere, and only cleaned on the premises.				Yes. Buy soap, 58,000 lbs. in value 600*l.*	About 2,504,000 gallons of well water, say 5,008,000 gallons from stream, total 7,512,000 gallons, but this is variable as the supply from the stream is uncertain.	No, they are too much diluted to be of any value.	—	—	—
Nil	None	Yes. Gallipoli, 650*l.*	None	No	None	Not yet, but we have erected buildings for the purpose.	—	—	—

Are the whole Washings treated, or only the First Flow?	15. Does the Water from the Grease Process pass away clear, or how nearly so?
2,500*l.*	Cannot say. Waste flows into river.	Yes. Rape, Price's patent cloth, and olive. In value 8,000*l.*	About 336,000 lbs. called Kent muck, at one time used for hops now sold or put on land, and about 12,000 lbs. waste sold to low carpet makers.	Yes. Buy soap, about 112,000 lbs. In value 1,700*l.*	River water principally, sometimes waterworks company.	Yes, by Messrs. Teall, Le Paige, and Company.	130*l.*	The first flow.	—
150*l.*	Waste water into river Aire.	Yes. Gallipoli, olive. In value 3,500*l.*	64,000 lbs. per annum; sold to waste dealers.	Yes. Buy soap. In value 1,000*l.*	15,000,000 gallons from river Aire and waterworks company.	Yes, by a contractor.	75*l.*	The first flow and the finishing.	Very nearly.
- - -	- - -	Yes. In value 1,000*l.*	48,000 lbs. per annum; sold to clothiers.	Only wash wool. See No. 4.	Only wash wool. See No. 4.	Yes, by a contractor.	About 100*l.*	All - -	Clear.
None.	None.	Yes. Gallipoli. In value 800*l.*	Cannot tell quantity; all sold.	Don't wash goods. Buy soap. See answer to No. 3.	None - - -	Yes, by a contractor.	About 150*l.*	The second flow only.	Nearly so.
350*l.* to 400*l.*	374,400 gallons; waste pumped out to land.	Yes. Olive and patent. In value 4,000*l.*	896 lbs.; we sell it, or put it on to land.	Yes. Buy soap, 11,200 lbs. In value 200*l.*	3,080,200 gallons; from springs.	No - - -	Nil.	- - -	All pumped on to land.
400*l.*	Waste flows into beck.	Yes. Olive and patent. In value 650*l.*	Burnt chiefly -	Yes. Buy soap. In value 250*l.*	Spring water -	Yes, by a contractor.	20*l.*	First flow	Nearly clear.
22,000*l.*	15,650,000	Yes. Gallipoli and Price's patent oil. 4,000*l.*	336,000 lbs.; used on land, and also in Kent for hop growing.	Yes. Buy soap. In value 2,500*l.*	109,550,000 gallons; one-third from wells, and the remaining two-thirds from river.	Yes, by a contractor.	150*l.*	The whole	Quite clear.

APPENDIX No. VII.

Impounding Reservoirs.

The first consideration in any proposed impounding reservoir work should be as to the site of the bank, and how to deal with it. If the site is rock, limestone, millstone grit, or other open-jointed rock, care must be taken so to combine the material of the bank with the rock as to prevent "creeping" and washing of water from within the reservoir along the junction of the puddle and rock at the bottom and sides of the bank, as also through the beds and joints of the strata. The cheapest material which can be safely used will be concrete, made of the best hydraulic lime, and laid thickly over the entire surface of the puddle-trench. Concrete, or a thick bed of mortar, should in fact protect puddle from contact with rock, gravel, clay, or earth at every point. A trench (answering as puddle-trench), filled with concrete, may in some instances be necessary if the ground contains landsprings, or produces much water during its excavation. If a trench fills rapidly with water when open, it may admit water to act upon any clay-puddle when the work has been completed, and just in proportion as this admission of water takes place under pressure, and washing or wasting of clay-puddle takes place, will there be danger to the embankment. On the other hand, concrete which has set will neither be injured nor injuriously wasted by washing, but any melting out of portions of lime will tend to fill up the pores and channels in the rock along which lime-impregnated water finds escape. An embankment having its base and sides fully protected by concrete and good rough hydraulic mortar, might leak considerably through fissures extending below the embankment, and yet not leak dangerously, as there could not be any washing and wasting of the material forming such bank.

No embankment should ever depend solely on a "clay puddle-wall." Puddle-walls should be supported throughout the main body of the bank on both sides, by selected material, such as earth freed from stones, loam, shale, or clay, and in this state capable of resisting water. Such selected material, combined with the puddle, should form the central portion of the bank, and be in substance not less than one-third of the entire bank. It will, however, be far better and safer to select material for the entire bank, and place it in thin layers (not exceeding 12 inches in depth,) evenly over the entire surface of the bank, using neither railways nor waggons, but wheelbarrows and "dobbin-carts."

The "Bunds" or banks of the great "Tanks" or reservoirs in India, have no puddle-trench such as modern engineers excavate (120 feet in depth at times). These Indian embankments were most probably formed on the surface after precautions had been taken to prevent creeps of water betwixt the materials used and the ground. The earth to constitute the bank was then carried to the site by numerous labourers, male and female, and was trodden down by thousands of naked human feet, sometimes also by the feet of elephants, and so was alternately washed by monsoon rains, dried by a tropical sun, and thus grew slowly, through years of labour, to be the enduring mass which has weathered the storms and tempests of not less than 30 centuries. Embankments have from time to time been ruptured and washed away in India in consequence of bye-wash space being limited, but other great Indian embankments have stood, and are now standing, to attest the skill, patience, and labour with which they were first formed. Many of the reservoir embankments in England recently formed have been made too rapidly. The hot speed of railway works cannot be safely adopted in waterworks. There must be time for incorporation of material with material, and for slow consolidation.

Reservoir embankments ought to be executed with more care, and will then necessarily be proportionately more costly than ordinary railway embankment works. Cheap work and speed have, however, been cried out for, and engineers have committed the fatal mistake of allowing the lowest contractor to have the job. The inevitable results are either that the contractor fails before the work is far advanced; or, if allowed to complete the bank, that the work, on being tested by filling the reservoir, proves worthless. A sound, safe, and enduring reservoir embankment cannot have been constructed at much less than double the price paid for earthwork which safely serves for railway embankments.

Reservoir embankments should never have outlet-works (pipes, culverts, or sluices) placed beneath or in the bottom mass of the made bank, but such works should be formed in the solid ground, on one side, so as to be beyond the influence of any subsidence or motion caused by piling up the materials forming the bank. Clay and marl subsoils will compress, subside, and occasionally slip, in which cases any pipes or culverts if placed in such bank are damaged, if not broken and utterly ruined.

Outlet-culverts need not be laid with their inverts at the bottom level of the reservoir, but may be from 10 to 20 feet above the inner bottom level of the bank. This mode of working insures that the base of the bank shall be undisturbed. In the Dale dyke reservoir which gave way above Sheffield, and destroyed some 235 human lives, cast-iron pipes were laid beneath the mass of the bank, at its lowest depth, the same pipes having the fall or grade of the valley, which amounted to near 20 feet in the 500 feet width of the bank; thus adding 20 feet additional pressure on the valves, which were placed on the outer foot of the bank. If a level culvert had been formed in the solid rock on one side, having its invert 20 feet above the bottom of the reservoir on the inner sides, and the valves had been placed in such culvert, there would have been 40 feet less head, and consequently 40 feet less pressure on the deepest working valve. The inner 20 feet in depth of water in a V-shaped valley, having a rise of 70 feet in the mile, is of little consequence, and the space forms a receptacle for sediment. But even this volume of water can be provided for, so as to be drawn down by a syphon laid through the outlet culvert, that the last foot in depth of water may be abstracted.

Some large embankments have failed so as to prevent their use, and the money expended upon their construction has been wasted. A reservoir embankment may fail from several causes, as—

1. Where an improper site has been chosen, upon rock full of natural fissures which cannot be traced and stopped.
2. Where the subsoil is compressible, as on silt, clay, or marl, and where outlet works have been placed in the made portion of such bank, and subsidence, crushing, and slipping have taken place.
3. Where a puddle-trench is affected by springs which have not been drained; or where washing and wasting of the clay-puddle commences through some undiscovered fissure, in rock or vein of gravel or sand, if in alluvium, after the head of pressure brought to bear from a full reservoir has been established.
4. Where the material of which the embankment is composed is not calculated to become water-tight, as rocky material or gravely earth tipped in from railway waggons an ordinary puddle-wall cannot be trusted under such arrangements; water under pressure finding its way to a puddle-wall so supported will have all its weakest points sought out and tested, and a leak once set up in such case must be a source of danger.
5. Where an embankment is made entirely of clay, which melts and slips as such material is liable to do if put together during wet weather.

A reservoir may also fail by a creep of water taking place through the embankment along the outer surface of either cast-iron pipes or outlet-culvert, or by drawing water from valves placed

under too great pressure within the embankment. Water issues through valves with friction and velocity proportionate to the head; it obeys the law of gravity applicable to the falling of solid bodies. A solid body of cast-iron falling through 90 feet of space would only strike with a similar velocity to that with which water would rush through an open valve at this depth, and as the power of water to wear, wash, and injure is in proportion to its volume and velocity, the engineer should, in his reservoir arrangements, use all practicable means to control and prevent high velocities through valves, discharge-culverts, and over bye-washes. No outlet valve ought to be placed under a greater head of pressure than 20 feet. Vertical wells for overflow are not advisable even when constructed in solid ground, but if formed within the substance of embankments they are positively dangerous. A bye-wash should be formed down the solid ground, and by steps not exceeding 4 feet in depth. The usual slopes given to reservoir embankments formed of earth are, on the inside 3 horizontal to 1 vertical, and on the outside $2\frac{1}{2}$ horizontal to 1 vertical. Minor details of construction and general rules for maintenance and working of impounding reservoirs cannot be fully given here, they will require to be treated separately in some special waterworks report. R. R.

Note.—In a valve-well there may be valves not more than 10 feet apart vertically, so as to reduce the pressure on any single valve to 10 feet, as the water is reduced.

APPENDIX No. VIII.

From the Times Newspaper of August 1, 1867.

Court of Chancery, Lincoln's Inn, July 31.

(Before the Lords Justices of Appeal.

Baxendale *v.* M'Murray.

This case has been already noticed in the *Times*. It will be remembered that it came on by way of an appeal from an injunction granted by Vice-Chancellor Stuart in July 1866, upon a motion for decree, restraining the defendant, Mr. M'Murray, from polluting the river Chess, near Rickmansworth, by the refuse from his paper mills. The operation of this decree was afterwards suspended by the Lords Justices pending the appeal. The plaintiff, Mr. Baxendale, is the occupier of Scotsbridge House, through the grounds of which the river Chess flows, this house and grounds being situate lower down the stream than Mr. M'Murray's mills. The mills were formerly occupied by the late Mr. Ingram. The plaintiff alleged great nuisance resulting to him in various ways from the refuse which flowed from the mills into the river, and in particular he said that whatever right to foul the stream had been acquired by the former owners of the paper mills, inasmuch as Mr. M'Murray had introduced into the manufacture of his paper the new material called Esparto grass, the fouling of the water thereby produced was a new kind of nuisance, with respect to which no prescriptive right had been acquired. The defendant maintained that he had a right to foul the stream in that way, provided he did so to no greater extent than his predecessors had done, and this he said that he had not done. The evidence was, as usual in cases of this kind, very conflicting. The appeal was argued at great length before Lord Cairns and the late Lord Justice Turner, and judgment was reserved, but was not delivered before the death of the latter. As the parties entertained some doubt whether, under the new Act, one Lord Justice could hear an appeal from a decree, even though made upon motion the appeal was placed on the paper to-day before both their Lordships for the purpose of being formally re-opened, and having the judgment of the Court.

Lord Justice Lord Cairns then stated, with a view to other cases of the same kind, that he had conferred both with his learned brother and the Lord Chancellor, and that they were all of opinion that under the new Act one Lord Justice had jurisdiction to hear appeals from decrees made upon motion for decree.

The appeal was then formally re-opened.

Mr. Bacon, Sir R. Palmer, and Mr. Fry appeared for the defendant; Mr. Dickinson and Mr. Birley for the plaintiff.

Lord Justice Lord Cairns then delivered the judgment of the Court. He said that the conclusion at which he had arrived was concurred in by the late Lord Justice. After a statement of facts of the case, his lordship proceeded thus,—Does the use of a new raw material in the manufacture of paper, from the mere circumstance that the material is raw and different from that formerly used, destroy the right previously possessed by the defendant to discharge polluted water into the stream? With great respect for his honour the vice-chancellor, I doubt whether the question on this part of the case is one as much of law as of fact. The question appears to me to be, what is the right or easement of the defendant? Is it a right, specific and defined, to pollute the stream by discharging the dirty water in which rags have been washed; or is it a right to discharge into the river the refuse liquor and foul washings produced by the manufacure at his mills of paper, in the reasonable and proper course of such manufacture, using the materials which are proper for the purpose, but not increasing, as against the servient tenement, to any substantial or tangible degree, the amount of pollution? In my opinion the right of the defendant would, upon the facts before us, be found, and be properly found, by a jury to be the latter and not the former. It is difficult to suppose the existence of an easement founded on and limited to the washing of rags. If made specific in this way, it would be confined to rags known and in use at the time the easement was acquired, and the rags of textile fabrics afterwards coming into use must, however valuable for the manufacture of paper, be excluded. Rags, again, would afford no standard by which to test or limit the amount of pollution. Some would be much more dirty than others; the washings from some might be harmless, and from others deleterious. In rags produced from vegetable substances the properties of the fibrous matter might be very different; in some, as in linen and cotton rags, the fibre being elaborately treated in the course of manufacture; in others, as in coarse sacking or bagging, especially of hemp or jute, the fibre retaining much more of its original character. I am therefore of opinion that it is not sufficient for the plaintiff to show that the defendant uses in the manufacture of paper a raw material different from that formerly employed; he must show, further, a greater amount of pollution and injury arising from the use of this new material; and the onus, of course, of showing this lies on the plaintiff. His lordship then commented at considerable length on the various heads of nuisance alleged by the plaintiff, and the evidence relating to them, and came to the conclusion that the plaintiff had failed to make out his case. The bill must therefore be dismissed with costs.

APPENDIX No. IX.

TOWNS, and PLACES, situate in the Basin of the Rivers AIRE and CALDER, divided into proposed CONSERVANCY DISTRICTS, with the AREAS and POPULATION, from 1801 to 1861, compiled from Census Tables.

Proposed Conservancy District.	City, Town, Borough, Township, Hamlet, or Place.	Area in Statute Acres.	POPULATION.						
			1801.	1811.	1821.	1831.	1841.	1851.	1861.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE COMMISSIONERS

APPOINTED TO INQUIRE INTO

THE BEST MEANS OF REMEDYING THE POLLUTION OF RIVERS.

INQUIRY INTO THE STATE OF THE RIVERS AIRE AND CALDER, AND THEIR TRIBUTARIES.

Wakefield, Tuesday, 16th October 1866.

PRESENT:

ROBERT RAWLINSON, ESQ., C.B., IN THE CHAIR.

JOHN THORNHILL HARRISON, ESQ. | Professor JOHN THOMAS WAY.

WAKEFIELD. 16 Oct. 1866.

(*Chairman.*) Gentlemen,—the Commissioners appointed to inquire into the pollution of rivers appear here to receive evidence relative to the state of the rivers Aire and Calder and their tributaries, under the several heads set forth in the notice which has been duly advertised and circulated.

I will first draw your attention to the terms of the Commission, viz.: "Whereas we have deemed it "expedient for divers good causes and considerations "that a Commission should forthwith issue for the "purpose of inquiring how far the present use of "rivers or running waters in England for the purpose "of carrying off the sewage of towns and populous "places, and the refuse arising from industrial pro- "cesses and manufactures, can be prevented without "risk to the public health or serious injury to such "processes and manufactures, and how far such "sewage and refuse can be utilized or got rid of "otherwise than by discharge into rivers or running "waters, or rendered harmless before reaching them; "and also for the purpose of inquiring into the effect "on the drainage of lands and inhabited places, of "obstructions to the natural flow of rivers or streams "caused by mills, weirs, locks, and other navigation "works, and into the best means of remedying any "evils thence arising." This wording of the Commission is especially guarded, as it is not contemplated that the trade and manufactures of the country are to be injuriously interfered with, but that the inquiries shall be so conducted as to elicit the truth on both sides of the question. I mention this particularly, because some persons appear to be apprehensive that there may be such interference as to injure trade and manufactures. I think, however, upon calm consideration, you will see that the interests of the manufacturers of this county are of such vital importance, and so essential to the well-being of the whole community, that the Legislature will be very cautious how it does anything that shall be prejudicial to trade. If it is possible to diminish the pollution of streams, without serious injury to trade and manufactures, it will no doubt be the duty of Parliament to enact such laws and to enforce such regulations as shall be for the benefit of the whole district.

Mr. JOSEPH RHODES examined.

Mr. J. Rhodes.

1. (*Chairman.*) Are you mayor of Wakefield?—Yes.

2. How long have you been resident in this district?—60 years.

3. Have you paid attention to the condition of the streams in this district, so as to be able to speak to their present and their former condition?—Yes.

4. Will you state what was their former condition?—In my early days the river here was pure or nearly so. I am speaking of the river Calder. The water was then sweet and clean, and it was full of fish.

5. What kind of fish?—Roach and perch.

6. What is the general character of the manufactures carried on in this immediate neighbourhood?—Worsted spinning for knitting worsted; that is the main manufacture. That was originally started here. I think this is almost the only district, except Leicester and Aberdeen, where that kind of worsted is manufactured—knitting worsted and stocking worsted. A part is made in Manchester and a little in Glasgow. There is one firm at Manchester, and there used to be one very extensive one at Aberdeen, which perhaps manufactured as much as the people in Wakefield did.

7. What works on the banks of the river a little above Wakefield pollute the water?—There are some, particularly about Battley—Carr, and Dewsbury. They are all cloth manufactories in that district, and that sort of cloth is manufactured which is made almost without wool. They use rags, shoddy, &c., that makes the water worse still.

8. Old rags are worked up again?—Yes. Of course they use a portion of fresh wool, but the stream that comes down there is awful. It is quite sufficient to

WAKEFIELD.

Mr. J. Rhodes.

16 Oct. 1866.

contaminate a river; but in all the valley up the river to Todmorden there are manufactories of various sorts of woollen and cotton. There are large works at Sowerby Bridge and Luddenden Foot. At Dewsbury and Ossett there are large woollen and worsted manufactories on the bank of the river.

9. Do all those works use water for cleansing and manufacturing purposes, and return the refuse back again into the stream?—Most of them; but the evil has been mitigated of late years by the owners of the mills saving their suds and utilizing them, making soap and oil from them again, but there is still a vast quantity of refuse coming into the river.

10. Are there any dyeworks?—Yes. Large works were in existence as far back as I can recollect. The Messrs. Holdsworths used to dye large quantities of woollen and stuff goods for the Bradford and Leeds people, and the chief recommendation was that we had such pure water here. I am afraid the superiority has now vanished, owing to the filthy state of the river.

11. Do you think that has led to the removal of the dye works, or diminished the trade in this district?—I believe that the dye works have not nearly so much business as they had; but I cannot speak particularly to that point.

12. Is the river liable to flood the land injuriously for any distance above or below Wakefield during heavy rains?—Very little. I think there are very few rivers that go down an open valley which cause less flooding. I think that the floods are fewer and to a much smaller extent than they were when I was a boy.

13. Do the towns and villages situated upon the river pass their sewage into the river?—I think every atom of it goes in, except what they save in the privies, and perhaps distribute on the land.

14. Where there are sewers on the margin of the river, the contents of those sewers are passed into the river?—Yes, they can go nowhere else, I believe. The river winds amongst hills. I do not see that the people could turn their sewage anywhere else. I have not heard of a single case where they save the sewage and utilize it.

15. Is it within your knowledge that persons owning sites on the banks of the river throw their ashes in, or refuse of any kind?—I do not know. I think they do much as they like; every one on the side of the river.

16. You think each owner on the banks does just as he likes?—I have not heard of any objection being made. I do not recollect any lawsuits. I have understood that the Messrs. Holdsworth some years ago did throw their ashes from their dyeworks into the river.

17. Have any complaints been brought before you as to the foul condition of the river since you have been mayor?—No public complaints, I believe, but complaints are universal throughout the town of the filthy state of the river. Only a few years ago boating was very pleasant on it. Now I should not like to go on account of the effluvia. It would do more harm than good.

18. What is the population of Wakefield?—At the last census it was 23,350.

19. What is its rateable value?—It was about 72,000*l.* last year.

20. Is the town of Wakefield sewered?—Half sewered. We are going to complete the sewerage now.

21. What becomes of the sewage?—It all goes into the river I am sorry to say.

22. Have you a local water supply?—Yes.

23. Is it supplied by a private company or by the corporation?—By a private company.

24. Where do they obtain the water?—From this river the bulk of it.

25. Is the water obtained by pumping from a point a little below the town?—Yes.

26. After the sewage of the town has been passed into the river?—Yes.

27. Is that water filtered or not?—It is filtered by Mr. Spencer's system, which I daresay is the best. It is of a little value to make the water drinkable.

28. In completing your system of sewerage have you borne in mind that you may be required to utilize the sewage and keep it out of the river?—I have mentioned that many times, particularly when we had a resolution as to the outlet sewers carried through the council. I mentioned that it would be much better to construct works to utilize the sewage as it came from the sewers. I have also opposed any alteration of the outlet, thinking it would be useless in a short time.

29. The question has been discussed or spoken of in the council?—I think there was no one but myself and Dr. Holdsworth who urged it on the council. I am rather diffident about it. I have not yet seen any good works, so as to be able to tell whether it would answer or not.

30. Has there been any discussion in the town council or in the town as to whether the water was of a desirable quality?—I am afraid that we are hardly awake to this question yet. Most people are not aware of the mischievous effects of such water as we are now drinking.

31. Have there been in the past summer any cases of cholera in Wakefield within your knowledge?—Only two or three cases a few days ago.

32. Are there any tanworks in the town or near it?—Not nearer than three or four miles off the stream. I believe that any refuse from those will ultimately come into this river.

33. Are there any public slaughter-houses in Wakefield?—Yes, one.

34. Are there any private slaughter-houses?—Yes, there are, which we have been obliged to tolerate.

35. Do you know whether the refuse from those slaughter-houses passes into drains and into the river?—I believe that most of it does.

36. And have you no check upon this?—I cannot be aware of all that is being done in the slaughter-houses, but I do know that some of the refuse goes into the sewer, and finds its way into the river.

37. Have you not considered the question of having general slaughter-houses for the borough?—No; and there is another thing. During the cattle plague we were compelled to kill all the cattle that came to the weekly fair in this town, which supplies meat for hundreds and thousands all round. We could not slaughter all in the borough slaughter-house. During the natural state of the markets the persons came and bought the cattle, and took them to their destination, and slaughtered them in those towns and villages where they were wanted.

38. Are there any gas works here?—Yes.

39. Do they belong to the corporation or to a company?—A private company.

40. Are they situated near the river?—No; they are about a mile away.

41. Have you reason to think that they tend to contaminate the river or not?—I cannot speak to that.

42. If there is any pollution, it is not a notorious pollution?—I think not. I suppose the tar and ammoniacal liquor and other products are taken away now, being saleable.

43. Is the scavenging done by contract, or are the cesspits of the cottages left to be emptied by the owners, or do you undertake the scavenging?—Something between the two. We are not bound to take away night-soil, or to remove nuisances. Our duty is to compel people to remove their own; but we found that so impracticable, and we were so alarmed about the cholera this summer, that we set our own men to empty all the privies and remove all the nuisances that we could.

44. The fear of cholera passing away, will you relapse into your old state of neglect?—I hope not. My period of office is nearly expired, but I have no doubt that my successor will endeavour to carry out improvements in the town.

45. Have you paid attention to the state of the

cesspits when they are being emptied?—Not at that time, because it is generally done in the night-time.

46. Did you ever happen to perceive a smell in the streets when the nightmen were working?—I have seen carts in the morning, and I have seen middens being emptied on the road, and they are very foul. I always keep away from them. Our inspector has particular orders from the council to get them all emptied, and to deodorize them with Dr. Bishop's powder while they are being emptied, and after they are finished. The powder is spread all over the place.

47. Did that rule apply before the cholera was apprehended, or was it merely a temporary effort?—We have been alive to that point for several years past. I think two or three years ago a deputation went to Leeds to inquire into the best means of getting rid of night-soil and deodorizing it. We got the powder then, and have used it regularly ever since.

48. Have you paid attention to the question of river purification, and formed any opinion as to whether any practical means may be found for mitigating the evil of river pollution?—I have entertained it very seriously many times, and I cannot see how to get out of it without an immense expenditure. If we had intercepting sewers from Todmorden (for that is the place where the pollution begins) it would be a most expensive piece of work. I think the best way to mitigate the evil is to get an ample supply of pure water from some distant grounds.

49. Do you think the getting an ample supply of pure water would avail if you turned it into polluted water?—It would not make the river fit to boat upon, but we should be able to have plenty of water for all manufacturing and culinary purposes. It would improve the current of the river, and mitigate the evil to a small extent.

50. Has your inspector of nuisances or scavenger authority from you to scavenge or cleanse the river. Suppose, for example, that carcases of dead animals are floating in it, is any person instructed to bury them?—No, they have no special instructions. I think the matter would come under the general instructions if there was a nuisance.

51. Has there ever been a scheme proposed to the town council for intercepting sewers to remove the sewage of Wakefield from the town and from the river?—Only a very imperfect one, to carry the outlet a little further beyond the railway bridge, which I thought would increase the evil. When we do carry our outlet further, I hope arrangements will be made to turn all the sewage on to the land. There is a situation very favourable for such a system; there are high hills with the ground sloping down for some distance all round about.

52. Is coal obtained near Wakefield?—Yes, under Wakefield we have all the beds, except one or two.

53. What is the commercial value of coal in the town of Wakefield?—Almost all the engines use smudge and small coals and dust.

54. What is the price per ton?—About from 2*s.* to 2*s.* 4*d.* at the pit, and it costs on an average 1*s.* a ton leading.

55. About 3*s.* 6*d.* at the outside?—Yes.

56. Has there ever been any proposition in the town council to purchase the existing water supply with a view to improving it?—Yes, we nearly made a bargain for it three or four years ago. We then called a public meeting, and the people there who knew more how to talk than to work upset our bargain.

57. If you had purchased those works, would it have involved an extension of them, or should you have abandoned the idea of bringing in water from any purer source?—We should have abandoned the river as a source of supply.

58. You would have procured water from a purer source?—We have not found one as yet, but we thought we might. We are at a distance from a purer supply, and to connect this town with any such supply would involve an immense outlay, perhaps more than the people of the present day would sanction.

59. Have you any written or printed report on the subject?—No; but there would be the minutes of our proceedings. I know that we spent a vast deal of time in looking at the sources round about. We considered the supplies the present water company proposed were not worth entertaining.

60. (*Mr. Harrison.*) Under whose management is the river?—I think we have nothing to do with the river; it is like private property.

61. Whose property is it?—The Aire and Calder Navigation Company's.

62. All of it?—Yes, and the Calder and Hebble. I think they are amalgamated now; a lease exists.

63. Are there commissioners whose duty it is to see that the Aire and Calder Navigation Company do their duty?—I am not aware.

64. When you looked into the question of applying the sewage to the land, did you find that there was any difficulty in obtaining land for its application?—I believe not.

65. Should you have to pump the sewage or apply it by gravitation?—We must pump it.

66. Has any report been drawn up upon the subject by the surveyor or others as to the application of sewage to land?—I think not. Our late surveyor went with me to look over the land twice, and we suggested a system that might be carried out very well, so as to rid us of all our sewage. We should have required a pumping engine, and a reservoir on the top of a hill, and pipes from that.

67. (*Chairman.*) Supposing the legislature passed an Act making it imperative that the pollution should cease as far as practicable, and that there should be a local conservancy board with ample powers, has it occurred to you what form that board should take?—I have never thought of having any separate body for managing that matter. I have thought a committee of the local board could manage it quite well with the assistance of an engineer.

68. Do you think that a committee of the local board could be entrusted to interfere with those matters, with dyers, and other persons beyond your borough, because the pollution does not only consist of that which takes place within the borough, the river is polluted up and down; in fact from its source to its estuary?—I have not given that any thought; there are some trades that require so much water that they could not dispose of the refuse in any other way, unless by having intercepting sewers.

69. You see a difficulty in the way?—Yes.

70. I suppose that the success of many of these manufacturing operations, especially in the case of dyers, in some degree depends upon the volume, and perhaps more upon the purity of the water they have to use?—Yes.

71. If any practicable means could be found by which that water should be returned to the river in a much less polluted condition, it would be for the advantage of the persons using that water below?—Certainly.

72. It might not be to the advantage of the persons who polluted it above if they had to incur expense in making it comparatively pure?—They might be compelled to form reservoirs, and perhaps filters, between the reservoirs and the river.

73. Seeing the condition of the river, would it be an intolerable hardship if the abusers of the water who make a profit by abusing it were compelled to apportion some of that profit to restoring the water again to a comparative state of purity?—I think, if it was a hardship, they ought to be compelled to adopt any system that would improve the water.

74. Any system that would not be absolute ruin to the trade?—Yes. I am afraid the pernicious salts could hardly be got rid of. They could not be filtered out. The best system for making the water as good as we could would be to have subsiding reservoirs, and a filter besides, through which the water should be passed before being turned into the river again.

75. (*Mr. Harrison.*) When were the waterworks established at Wakefield?—In 1837.

76. When did you carry out the partial sewerage of

WAKEFIELD.

Mr. J. Rhodes.

16 Oct. 1866.

the town?—I do not know; it may have been one hundred years ago for what I know.

77. Was the outlet you speak of, which is above the point from whence the water is drawn, in existence when the waterworks were established?—Yes, I remember it when I was quite a child; how long it was made before then I do not know.

78. Have you extended the sewers in the town since the waterworks were established so as to bring down more sewage to that point?—Yes; but we have not had any extensive increase of sewage, I think, till last year and this; we are now trying to carry out the whole system.

79. Is the population of Wakefield increasing?—Yes, it has increased more in these last two or three years than perhaps in 10 or 20 years before.

80. You object to the water of the Calder as a source of supply to the town, in consequence of the pollution by the towns above as well as of the pollution that is caused in Wakefield?—Yes. I do not think any chemist could make that water fit to drink.

81. (*Professor Way.*) Do you think that the refuse of manufactories or the sewage of towns causes the greatest evil in the river Calder?—I can hardly answer that question.

82. I think you said you were an advocate for the application of sewage to land?—Yes, if I thought it could be made to pay, or that it could be done at an expense of 500*l.* or 1,000*l.* a year to the town, I should advocate it.

83. (*Chairman.*) If it is practicable to do it at a moderate cost, you would say that the town ought to be made to do it?—Certainly.

84. You mention that Dr. Bishop's powder had been used for sanitary purposes; do you know what that is?—I fancy it is charcoal and perhaps sulphuric acid.

85. Is Dr. Bishop a local person?—He is a Leeds gentleman. I think there is a company for manufacturing the powder.

The witness withdrew.

Mr. Henry Morgan, Deputy Town Clerk, read a report which had been drawn up by the Town Clerk, Mr. James Whitham, and handed in the same, as follows:

In 1771 (11 Geo. III.) an Act of Parliament was passed for the better paving, repairing, and cleansing the streets, lanes, alleys, and other public passages within a certain portion of the town of Wakefield, and which at that time comprehended very nearly the whole of the town. By this Act certain commissioners were appointed to carry out the sewering, paving, and cleansing of the town. Previous to the passing of this Act, the sewage of the town used to find its way into the river Calder by two channels. One channel was a beck or stream, called the Skitterick, which rose at East moor (on the east side of the town) flowed through the town across the street of Wrengate and along the back of the street called Kirkgate for about half way down the street, when it diverted into the middle of the street until it emptied itself into the river near the ancient Soke Mill and near to the spot where the present outfall is. The other channel was an open ditch which used to flow down the street of Westgate, in a westerly direction to Westgate, otherwise Ings beck, and which beck emptied itself into the river a little above the Soke Mill Dam.

The Commissioners under the above Act continued in existence till May 9 1853, when Stat. 16 Vict. cap. 24 was passed, and which repealed the Commissioners Act, and directed that all their powers should cease, and that the Corporation of Wakefield should be the Local Board of Health for the whole of the borough of Wakefield and carry out therein the provisions of the Public Health Act.

Soon after the passing of the Act of 1771, the Commissioners made sewers in Kirkgate and Westgate, and covered over the open becks or ditches, and diverted them into the sewers, and instead of the sewage flowing into the Soke Mill Race, the Commissioners made a syphon sewer under the mill race and emptied it into the river. This outfall remains in the same place to this day (except that the Local Board enlarged it), and ever since 1771 to the present time this outfall has formed the main outlet for the sewage of Wakefield.

Shortly after the application of the Public Health Act to Wakefield, the Local Board turned their attention to the sewage question, and made several attempts to provide a better outfall, and if possible to free the sewage water from the sewage before the water reached the river, but their attempts have hithetro been unsuccessful. On reference to the corporation minutes, it appears that on July 13, 1853, the Local Board directed their then Surveyor to suggest an improved outlet, having regard to a general system of sewerage for the Borough, but he was incompetent to the task, and nothing was done.

On February 6, 1856, the then Borough Surveyor reported in favour of a new outfall being made nearly a mile lower down the river than the present one and near the railway bridge across the river with deodorziing tanks so as to render the sewage water flowing into the river comparatively pure. The Local Board did not adopt this report, but recommended their Surveyor to make inquiries at various places where experiments had been made as to the disposal of sewage. In the meantime the Local Board directed the enlargement of the existing outfall, which was done.

The Wakefield Waterworks Company and the Aire and Calder Navigation Company having heard that the Local Board contemplated making a new outfall near the railway bridge, the former Company on October 6, 1856, and the latter Company on October 25, 1856, served notice upon the Board of their intention to take proceedings at law and in equity against the Board in case the new outfall were made.

On 17th November 1856, the Board appointed a Committee to consider the objections of the above Companies and to make inquiries and obtain information generally as to the best mode of making the proposed outfall sewer near the railway bridge and disposing of the sewage refuse, and on 4th February 1857, the then Borough Surveyor by the direction of this Committee, reported to the Board on the subjects referred to the Committee and the report was printed.

After considerable discussion, however, it was determined not to make the new outfall, and deodorizing works connected therewith in the face of the opposition of the above Companies but to wait until a Commission to be appointed by the Government should devise some scheme for the disposal of the sewage.

James Whitham first knew the river Calder in 1820. It was then nearly as pure as river water ordinarily is, and fish were numerous both above and below the Soke Mill Dam, and this state of things continued pretty nearly in the same position till about 30 years ago, when the river began to get gradually polluted, and the pollution has been going on increasing from that time to the present. The river is polluted nearly as badly as it can be before it reaches Wakefield.

The Wakefield Waterworks Company derive the principal portion of their water from the river, about three miles below the town, the residue being supplied from land springs. The waterwoks were first established by virtue of an Act passed 8 June, 1837, which authorized a share capital of 15,000*l.*, in shares of 25*l.* each, with power to raise an additional 5000*l.* by mortgage. In 1861 the Company gave notice of their intention to apply for another Act to authorize them to obtain an addtional supply of water from the neighbourhood of East Ardsley and about four miles nearly north of Wakefield. The Local Board caused this scheme to be examined by Mr. Bateman and the water to be analyzed by Mr. Dugald Campbell, and these gentlemen respectively having reported that the supply would be deficient and that the water was not fit for human consumption the Board petitioned against the Bill, and entered into a negotiation with the Company to purchase their works with a view afterwards to adopt a better scheme. In March 1862 the Company and the Local Board settled in writing the terms of an agreement whereby the Board were to purchase the Companies' works at the price of the then share capital (28,500*l.*), to be paid on 1st July 1870, with interest from 1st July 1863, when the Board were to take possession, subject to all the liabilities of the Company at the latter date. The Company were to abandon their Bill except so far as related to the money part, and the expenses of the Company were to be paid by the Board. The Board were to apply in the then next Session for an Act to carry the agreement into effect and were to be at liberty to include in such Act powers for obtaining supply of water and other usual powers. The agreement was to be subject to the confirmation of a public meeting of the inhabitants of Wakefield and of 3/5ths of the shareholders in the Company.

WAKEFIELD.

Mr. J. Rhodes.

16 Oct. 1866.

On 24 March 1862, a public meeting of the inhabitants was held, when the following resolution was carried by a large majority:—

"That in the opinion of this meeting it is inexpedient for the Wakefield Town Council as the Local Board of Health of this Borough to purchase the works, lands, premises, rights and privileges of the Wakefield waterworks.

In consequence the contemplated purchase was abandoned, and on the following day it was agreed between the Board and the Company that the Company should abandon their new water scheme, and should make their bill simply a money bill, and that the Board should withdraw their opposition to such bill.

On 30 June, 1862 the new Act of the Company (25 and 26 Vict., c. 99) was passed. It totally repeals all former Acts of the company. Sec. 13 enacts that the capital of the company shall consist of 840 25*l.* and 600 12*l.* 10*s.* shares already created, and of such shares as might be created under the powers of the new Act. Sec. 15 gives power to create new shares to the amount in the whole of 26,500*l.* Sec. 20 gives power to borrow 13,700*l.* Sec. 39 gives power to the company to maintain and improve their existing works, and (expressly) to take water from the Calder. Sec. 50 defines the limits of the Act to be the town and township of Wakefield, and the townships of Alverthorpe with Thornes Stanley cum Wrenthorpe and Sandal Magna. Sec. 51 fixes the following rates for water rents for domestic use in a dwelling-house:—

	£
Old Capital	21,000
Do.	7,500
New Capital	26,500
	£55,000
Power to borrow	13,700
	£68,700

Annual rent or value not exceeding	£	s.	d.	
Do.	10	0	14	0 per year
Do.	20	1	4	0 „
Do.	30	1	15	0 „
Do.	40	2	5	0 „
Do.	60	3	0	0 „

Above 60*l.* 5 per cent. upon the annual rent or value, and the Company are not to be obliged to furnish a supply to any owner or occupier for less than 10*s.* a year. Sec. 52 enacts that the water rent shall be payable according to the actual rack-rent or value. Sec. 53 enacts that domestic purposes shall not include waterclosets, or cattle, or horses, or washing carriages let for hire, or for any trade, garden, or ornamental purpose. Sec. 54 enacts that waterclosets shall be charged 6*s.*, and baths in houses 8*s.* each. By sec. 56 the Company may supply water for other than domestic purposes by contract. By sec. 61 the Company shall not be bound to supply water to the Corporation for public purposes at a lower rate than the lowest rate that the company charge to the largest consumers.

Since the passing of their last Act the company have laid out a considerable sum of money in a new pumping engine, larger mains, and in carrying out Mr. Simpson's plan of filtration; but the evidence as to these points will be given by other witnesses.

Mr. H. Morgan.

Mr. Henry Morgan (Deputy Town Clerk of Wakefield) examined.

86. (*Chairman.*) What is the area of the borough?—1,553a. 2r. 30p., and the population is 23,350, according to the last census.

87. Has it increased since that time?—We estimate it now to be 25,000.

88. What is the rateable value of the town?—In round numbers, 71,000*l.*

89. Has the corporation authority over the police?—Yes.

90. And the lighting, watching, and scavenging?—Yes; the Municipal Corporation Act is in force in Wakefield, the Public Health Act, and the Local Government Act.

91. Are there any independent townships that have separate jurisdictions?—Not any. I may state that the borough of Wakefield consists of the whole of the township of Wakefield, and parts of the townships of Alverthorpe with Thornes, and Stanley with Wrenthorpe.

92. (*Mr. Harrison.*) What has been the cause of the increase of the population since 1861?—Trade seems much better than it was some few years ago; there have been many more new buildings erected, and more manufacturing has been going on.

93. What are those manufactures?—I think the principal increase has been in the worsted manufacture; also some large ironworks have been established in Wakefield, and a cocoa-nut fibre company.

94. Are there any dyeworks in the town?—I have begun to make a list, and I will complete it for the Commissioners; but so far as the names have been taken out (and the last work has been done by one of the officers of the corporation), there are in Wakefield now 11 worsted, woollen, and cloth manufactories, four fibre mills, two soap and greaseworks, nine dyeworks, 58 malt kilns, and five large breweries; but, in addition to the breweries, there are about 65 publicans who brew themselves. The number of the flour mills has not been taken out, because it was supposed they would not pollute the stream.

95. Do all those trades you have mentioned more or less pollute the stream?—Yes. There are also some three or four chemical works, which will more or less pollute the stream.

96. What is manufactured there?—I do not know. Messrs. Hicks are manufacturers of copperas and sulphate of iron.

97. Are the dyeworks on a large scale?—One or two of them are on a large scale, for instance, those of Messrs. Holdsworth, and Messrs. Hodgson, Shaw, and Dent, a little above the dam.

98. Does all the refuse from their works go directly into the river?—I believe it does. In addition to those places there is the prison, which discharges, I believe, all its refuse—or they did so till very recently—into sewers which run into the river.

99. Is the system of waterclosets carried out to any great extent in the town?—I believe information will be given to you as to that by the surveyor, but I understand there are about 350 waterclosets which are supplied by the water from the waterworks company, and an estimate has been made as to the number of the waterclosets which have cisterns, and they are perhaps 200.

100. (*Professor Way.*) You say there are 58 malt kilns?—Yes.

101. Do they pollute the river?—Complaints have been made to the corporation at different times about smells and other things arising from the sewers in connexion with those malt kilns.

102. Is any part of the barley likely to be thrown into the sewers or the river?—That I cannot say. I only know that there have been frequent complaints made of very offensive and bad smells from drains connected with the breweries.

103. You spoke of cocoa-nut fibre being manufactured?—Yes, cocoa-nut fibre and china grass.

104. What is that?—Rhea.

105. Does it go through a chemical process in preparation?—I cannot say.

106. Is it within your own knowledge that the river was comparatively pure, and contained fish within the last 25 or 30 years?—I have seen fish in the river 18 years ago.

107. Was that above or below the town?—It was near the bridge. I have seen people getting them out.

108. Are there no fish in the river now?—Not of any kind.

109. No eels?—No.

110. (*Mr. Harrison.*) When the Aire and Calder Navigation Act was first passed there were two bodies: contractors who undertook the execution of the work, with whom it was a speculation, and Commissioners, whose business it was to look after the contractors, to see that they did their duty. Do

WAKEFIELD.

Mr. H. Morgan.

16 Oct. 1866.

those Commissioners still continue to act?—I am not aware that there are any Commissioners.

111. You say that since the waterworks were established, in 1837, waterclosets have been largely introduced, and that the outlet of the sewers is in the same place as it was before; there must therefore be a much larger quantity of sewage issuing at that point than before waterclosets were established?—Yes, owing to the increase of population. In addition to that, I believe that the Local Board of Health, since its establishment, has caused many ashpits to be drained, the contents of which find their way into the sewers.

112. (*Professor Way.*) Was the outlet at first established for the purpose of the surface drainage of the town, and was it made use of subsequently for the drainage of the cesspools?—At first, of course, it would have been for the surface water.

113. Do you live in the town?—Yes.

114. What water is supplied to you?—From the waterworks.

115. Do you drink it?—Yes.

116. Do you like it or dislike it?—I dislike it; but the water is very much clearer this year than it has been for many years back.

117. Has that been since the introduction of the new system of filtration?—Yes, it is very much harder. I have to use much more soap in washing now.

118. (*Mr. Harrison.*) Have you any analysis of the water?—No. I have here a paper which I have drawn out, showing the rateable value of the property within the borough.

The same was handed in as follows:

BOROUGH OF WAKEFIELD.

	1851	1861.
Population of the Borough -	22,066	23,350

Rateable value of Property.

	£	s.	d.		£	s.	d.

The witness withdrew.

Mr. J. Oakes.

Mr. JAMES OAKES (of Wakefield) examined.

119. (*Mr. Harrison.*) Are you a native of Wakefield?—I was born near the banks of the Calder, a mile above Wakefield, and I have a familiar acquaintance with the river from Wakefield Bridge up to Lupsett, about two miles above Wakefield. From 1826 to 1830 I had, during the greater part of the year, to cross the river twice every day, and walk a quarter of a mile down its banks. I have frequently bathed in it during that period, and spent many of my Saturday afternoons fishing in it. I have frequently drunk the water, and seen other persons drink it. I have seen at Wakefield Bridge, and in other shallow parts, hundreds of fishes at certain periods of the year. I have seen pike of all sizes taken out during the floods, and I have seen trout up to three pounds in weight—up to 1830 I speak of—and I think I can confirm the statement of the town clerk that the water was as pure as rivers ordinarily are. I think I may say from recollection that the water was as pure as that which the waterworks company furnishes to us now. I do not wish to say anything against the company's water, for I do not use it. Last year the water just below Lupsett Dam, which is nearly two miles above Wakefield, and therefore not contaminated by Wakefield, was really filthy. To one standing on the bank of the river at that time (last September) the smell was almost unendurable, and enough to make one ill. I do not think that there is a single fish in the river during all that length, from Wakefield down to the place I have mentioned.

120. Did you ever find the condition of the river to be the cause of ill health to any of the inhabitants on the banks?—I find that it has been the cause of fever in what is called Thorne's Lane, about half a mile above Wakefield Soke Mills, during the last summer and the summer previously; at least, the fever was believed to be caused by the bad smell of the river. I walked two years ago from Wakefield Bridge to Stanley Ferry, which is a little above the waterworks, and the colour of the water was black, and all along the bank for several feet towards the centre of the river, the water was covered with a slimy, offensive looking material.

121. What was the condition of the bed of the river between 1826 and 1830?—It was clean gravel.

122. What is its condition now?—Now, in many places there is a black deposit.

123. Of what thickness?—I cannot say.

WAKEFIELD.

Mr. J. Oakes.

16 Oct. 1865.

124. Within the borough of Wakefield there are large dyeworks?—Yes.

125. Was wool from Bradford and other towns formerly brought to Wakefield to be dyed?—Yes, a good deal.

126. Was there more dying carried on upon the upper parts of the Calder and the Aire at that time?—I think not; it was chiefly done here.

127. Since then dye works have been established on different parts of the river above Wakefield?—They have, but there is some Bradford trade now done in dyeing. I do not think, however, that the establishment which has been referred to does more than half the business it did 30 years ago.

128. What was the condition of the river in 1837, when the water works were established?—I think the condition of the river was very much better than it is now. I was not resident in the town then. I speak distinctly of the period from 1826 to 1830.

129. You have been away?—Yes; from 1833 to 1840 I was away.

130. Did you observe a great alteration in the condition of the river when you returned in 1840?—Not much; it has taken place since that time. There were fish in the river then. It was common to see fishermen passing through our village to the river, but that has ceased during the last 15 or 20 years.

131. To what do you attribute the altered condition of the river?—I believe that the chief mischief to our river comes from above. I do not think there is any material pollution from Wakefield, except what occurs from an increase of population. The worsted has to be scoured to get the oil out. When I was a youth all the worsted manufactories sent their refuse into the river; now all that grease is recovered; the liquid is run into cisterns and evaporated.

132. Is that system carried on in Wakefield?—At every manufactory suds are saved in a cistern, and purchased by a party who refines them. I should say that in consequence Wakefield causes less pollution to the river than it did 40 years since, except so far as there may be increased pollution from increased population.

133. From the sewage, and from the use of waterclosets?—Yes. As far as manufactories are concerned, I do not think Wakefield pollutes the river so much as it did then.

134. What was the population of Wakefield in 1820?—From 12,000 to 14,000, but I cannot say positively.

135. (*Professor Way.*) You spoke of some cases of fever which were supposed to be due to the state of the river; was there any official notice taken of those cases?—I believe so.

136. Were any complaints made?—I believe so.

137. Can you name the surgeon who was in attendance?—I cannot. The drains in that part are liable to be flushed by the floods in the river.

138. What class of manufactories do you consider most pollutes the river?—Dye works.

139. Do you think that if the river Calder had remained at Wakefield as pure, or comparatively as pure, as it was some years ago, the dyeing processes, instead of falling off, would have increased very largely?—I have not the least doubt of it. What brought the trade here was the reputation that the water was so pure here, and the dyeing consequently superior.

140. Then the dyers are their own victims, in fact?—It seems so.

141. Are you familiar with manufactures to any extent?—No.

142. Do you believe that the manufacturers will take any means to purify the water if it is not made compulsory upon them?—I do not think they are willing to do so; nothing but compulsion will accomplish the matter.

143. (*Mr. Harrison.*) The mayor stated that the river Calder was very little subject to flooding. Is that the case within your knowledge?—It more frequently overflowed 40 years ago than it does now. My father had a field near to the river, and when there was any considerable flood the lower part of the field was covered with water. I have seen a deposit of an inch or an inch and a half on the lower part of that field, but of late years, I do not know from what cause, the floods have not been so high, and the field is not so liable to be covered with water.

144. I suppose in 1852 the river overflowed its banks considerably?—Yes. I have heard the old folks speak of very considerable floods, but we have nothing like them now.

145. (*Professor Way.*) The town of Wakefield does not suffer much from flooding?—No.

The witness withdrew.

Mr. John Edward Dibb handed in a printed paper, headed "On the Water Supply," by Mr. G. F. Naylor.

Mr. J. E. Dibb.

146. (*Mr. Harrison to Mr. Dibb.*) Have you read this paper?—I did, very carefully, at the time of its publication.

147. Do you think that reliance can be placed on its contents?—I think it is a most singularly reliable paper. I do not think I ever read one more clear and distinct and logical on any subject whatever. I may mention that I have in my house a spring of remarkably clear and brilliant hard water, but I have for many years deliberately closed it, and have used the water of the waterworks company because I found the spring water so hard as to be detrimental to health. I always subject the water of the company to additional filtration in the house, and I believe that the health of my family has been considerably enhanced by adopting the waterworks water in place of the clear spring water.

148. What is your process of filtration?—I have several. I use Dahlke's Patent Water Purifier, recommended by Dr. Letheby, and adopted by the Drinking Fountain Association, supplied by S. Maw, Aldersgate Street, London. It is a white china filter, with a charcoal medium, and it has a singularly brightening effect on the water.

149. Have you been many years resident here?—Yes, since 1840.

150. You probably heard the evidence of the last witness as to the increased pollution of the river since then?—Yes. My belief is that the increased pollution of the river mainly arises from the additional sewage, which additional sewage chiefly results from an increase of the population and the waterclosets set up since the establishment of the waterworks company.

151. (*Professor Way.*) Your observations have reference to the water below Wakefield. What can you say as to the condition of the water above Wakefield?—I have no practical knowledge of that.

Mr. Joseph Johnson (Inspector of Nuisances of Wakefield) examined.

Mr. J. Johnson.

152. (*Mr. Harrison.*) Have you been long resident in Wakefield?—Yes, I was born here.

153. How many years have you been inspector of nuisances?—About 14.

154. Under the corporation?—Yes.

155. As a local board of health?—Yes.

156. Has the condition of the town improved during that time?—Many sanitary improvements have been made.

157. What have they consisted of?—Making drains in a great many of the bad streets, and improvements in the privy accommodation. Ash-pits have been rebuilt; old ones have been taken down that were in a bad state, and new ones substituted.

158. And water closets introduced?—Yes, in some instances; but many of the ash-pits have been improved.

159. What has been the effect of those improve-

WAKEFIELD.

Mr. J. Johnson.

16 Oct. 1866.

ments as to increasing or diminishing the quantity of refuse discharged into the river?—We have no less discharged into the river, but more. It is not allowed to lodge on the premises in the cesspools and such like.

160. Have many of the cesspools been done away with entirely?—Yes.

161. But not universally?—No.

162. What proportion has been done away with?—There exist but very few, only in the localities where drains have not been made; but we are making drains there now.

163. So that almost all the sewage and refuse of the town now goes into the river?—It does.

164. Has that occurred within the period of your being inspector of nuisances?—It is more the case now than it was when I first took office.

165. Before that there were cesspits, and the contents were carted away into the country?—Yes, by the farmers.

166. And that refuse is discharged into the river above the point from which the waterworks company take their water?—It is.

167. (*Chairman.*) How many ashpits are there in Wakefield?—About 1,400 or 1,500.

168. What size are they generally?—They vary considerably, according to the number of the houses. As a general rule they are about three yards by two.

169. Of what depth are they?—About a yard below the surface.

170. What quantity might be taken out of one of those ashpits in the shape of horse-loads?—About three 2-horse loads on an average.

171. How many 2-horse loads of that refuse is carted out of Wakefield in a year?—The smaller ones have to be emptied out about three times a year, and the larger ones perhaps twice a year.

172. Might I say that the 1,500 were emptied twice a year?—Yes.

173. That would be about 9,000 2-horse loads in a year?—Yes.

174. Have you ever seen any of those ash places overflowing with the soil from the privies?—Yes.

175. On the floor of the privy?—Yes.

176. And overflowing into the yard?—Not exactly into the yard.

177. Are any of those ashpits or middens situated close against the walls of dwelling-houses?—Yes.

178. Are any of them situated underneath buildings that are inhabited?—Yes.

179. Underneath the rooms?—Yes.

180. Have any complaints been made by the inhabitants of the houses adjoining, or those living in the rooms above?—Yes, occasionally.

181. Have you known fever prevail in those houses?—I have.

182. Of what kind?—Typhus.

183. Do you remember any special time or year when it was worse at one time than another?—It has been as bad this year in some parts of the town as ever I knew it.

184. Since last Christmas?—Yes.

185. Has it been a wet year or a dry year?—In the spring we had dry weather, and in the summer it was dry.

186. What kind of weather have you had during the autumn?—Very wet.

187. Long-continued wet?—Yes.

188. When has disease been worst; in dry weather?—No, in the wet weather.

189. At what time do you empty those ashpits; at what hours?—Chiefly in the night. Between 9 at night and 8 o'clock in the morning.

190. Have you, as inspector of nuisances, attended much during the time that the cesspits have been emptied?—Yes, very often.

191. Do any of the inhabitants complain when they are being emptied?—They complain when they are not emptied.

192. Do they complain when they are emptied?—Not often

193. They are glad to get the material taken away?—Very glad. It is the greatest difficulty in Wakefield.

194. Are those ashpits usually situated behind the dwelling-houses?—Yes.

195. Are there always passages or yards by which they can be approached?—Yes.

196. Have you known instances where the material has been carried or wheeled through the interior of the house into the lobby?—Yes, there are several instances in the town where the material must be taken through the dwelling-houses and front shops.

197. What condition are they in when the cesspits are being emptied?—They are very bad; but I obviate the evil by letting the people have disinfecting powder.

198. To mix with the refuse?—Yes.

199. Under any conditions it is an intolerable nuisance to the people at any time?—Yes, it is indeed.

200. Are there many waterclosets in the town?—Yes.

201. In what class of property are they?—In the better class of property.

202. Are there any attached to the cottages?—Some few, but they have not answered from the fact that the occupiers have not flushed them. They have abused them very much, and the owners have been put to very great expense. The local board of health would have carried them out to a greater extent had the occupiers paid proper attention to them.

203. Is there any difference in the people of Wakefield, as compared with those in London, in the use of such kind of accommodation?—I am sure I do not know how they do in London. It is very difficult to deal with them here.

204. In those places where conveniences are situate under the rooms, or in close contact to the dwelling-houses, would it not be a great improvement if the ashpits could be abolished, and the soil passed away daily?—That has often occurred to me.

205. There would then be nothing but dry ashes to deal with?—No; and it would be more healthy in these confined parts of the town.

206. Would it cost the town any more to remove those ashes every week, instead of twice a year?—Yes, a considerable deal more.

207. Why?—In the first instance it does not devolve upon the local authorities to do it. The law, as it at present stands, compels the occupiers to do it themselves.

208. Why then should they express pleasure at the contents of their ashpits being removed if the removal depends upon themselves?—Because they have a great difficulty in getting the farmers to remove it.

209. The farmers will only take it at such times as their teams are not otherwise occupied?—Yes.

210. When does that occur?—The greatest difficulty occurs during hay time and harvest and seed time.

211. Do the people pay the farmers for taking it away, or do the farmers pay for the privilege of taking it away?—The inhabitants are very glad to give it.

212. Have they to give anything in addition?—In some instances they do.

213. Would it not be a general benefit if the borough undertook regularly and systematically to cleanse all those places, irrespective of the convenience of the farmers?—The town would be much more healthy.

214. Would the process be much more costly?—I think so, and I will show you why. The local board at times, when the town is in a very bad state, directs me to employ men to remove this soil, and in doing so we have had at times to shoot it into quarries and bury it. That has been the only means we have had to get quit of it.

215. That would occasion an increased cost?—Yes.

216. What do you suppose it costs now each owner to cleanse his ashpit?—Taking it as a matter of cost, it is not much. Men already go to clear out the

dust-bins; but the greatest difficulty is where there is a long way to wheel up long passages and very narrow. The work requires a great deal more labour, and there is more expense in finding lights.

217. Have you any trouble with the private slaughter-houses?—Not a very great deal of trouble.

218. Are those places kept clean, or are complaints made about them?—Taking Wakefield as a rule, and the slaughter-houses in other towns, I think there are none to beat Wakefield.

219. Do you mean private slaughter-houses?—Yes, private ones. The public one has not been kept so clean as I should like to have seen it, and sometimes I have brought the parties before the magistrates for neglecting their duties.

220. Does it belong to a company?—Yes.

221. If the corporation owned the slaughter-houses could things be carried on better?—I think the slaughter-houses could be kept much cleaner and be managed much better. They are now leased by the butchers themselves for their own accommodation, and they have put a man in to manage them or rather mismanage them.

222. What becomes of the refuse that is made at the public and private slaughter-houses?—It is carted away by the farmers.

223. What do they do with the blood?—It is at present sent to Manchester; it had for some years been taken to Leeds.

224. To be used for manufacturing purposes?—Yes, for cloth establishments, in cleansing and scouring.

225. Have you any knowledge as to whether cattle are at all injured by drinking polluted water?—Cattle will not drink the water that comes down this river now. I have seen cattle drink it formerly. It used to be a regular occurrence to take the horses into it to drink it, and also cattle; but in consequence of its impurity they are not taken there now.

226. Will not cattle drink out of a farmyard pond, which receives a considerable amount of drainage from the yard?—If the water is good.

227. You say that they will not drink the river water?—They will not.

228. Have you seen much of the recent cattle plague?—Yes.

229. Has it prevailed much in the vicinity of Wakefield?—Not so much as in some other parts.

230. Have you had any diseased cattle that have died or have been slaughtered in Wakefield?—Yes.

231. Where did you bury them?—At the outskirts of the town.

232. In such positions that the matter from them could get into the watercourses?—It could not.

233. Do you find any difficulty in performing your duties as inspector of nuisances; are you resisted at all by parties?—Not in a general way, and I am pretty well received by the inhabitants.

234. (*Mr. Harrison.*) You mentioned that the ashpits were a great nuisance to the neighbours frequently before they were removed, and that people complained of them?—Yes.

235. Have there been cases of sickness arising from those ashpits?—Not that I am aware of. I am always very pleased to supply disinfecting powder when I know they are in a bad state. I am now sending a cargo of refuse away by boat to farmers in the country, and I shall report to the local board of health what success I have had, how much the removal has cost, and what I have made of the refuse. It is likely to improve the state of the town without any material loss; and I do not doubt that the local authorities will carry some such regulation out.

236. What do you expend for the borough in a year for disinfecting powder—take this year?—I laid out for the borough about a month ago 4*l*. I gave that for a ton of Dr. Bishop's powder from Leeds.

237. How long will that last?—Perhaps two or three months yet. We also use quicklime and soot.

238. To what cost is the borough put altogether for disinfectants of one kind and another in a year?—It would not run over 10*l*. a year altogether.

239. I think you stated that there had been typhus fever arising from the state of the cesspits?—I did not say that exactly; but it is in some of the worst parts of the town, the lower parts, near the railway station, that are the most enclosed.

240. Are those parts inhabited by people who come upon the rates for relief?—Yes, occasionally; but it is only through their own bad habits; they are people who could get plenty of good work if they would only attend to it; but instead of that they are an improvident class, and spend their money in drink, and for want of a proper regard to cleanliness they bring on this disease themselves.

241. It would be for the benefit of the town if the condition of their houses were improved?—Yes.

242. And in that way relieve the rates?—Yes. I may state also that the medical officer of the local board of health examined into the matter, and also the borough surveyor, and as an effect of their examination the local board have given notice to drain that part and to put in proper stench traps, and I believe that all those regulations will speedily be carried out.

243. Are the nightmen who are employed to remove the contents of those cesspits ever affected?—I never knew but one. I sent a man into one place, it was a cesspool where the gases were quite confined; he ignorantly went into that place, and there were hundreds of gallons to be removed, and the gases made him ill; he went home and was taken with typhus fever. That is the only case that I have known.

244. (*Chairman.*) How long ago was that?—About a year since. I did not know he was going in; he went in without my authority. I told him to raise the flags, and I would go myself and disinfect it; but when I got there he had been in the cesspit.

245. In cases of that kind you think that those places may be so poisonous as to be dangerous to health?—Yes, where the gases are confined.

246. (*Professor Way.*) This was a case in which the cesspool was a close one?—Yes, at the house of a gentleman, Mr. Smith, a solicitor.

247. Did you hear Mr. Oakes give his evidence?—Yes.

248. He stated that there had been cases of fever about the town, which he attributed to the river. Are you aware of anything of the kind?—The river smells very bad at times.

249. Has it come within your knowledge that any person has become ill from that cause?—I will not undertake to say so of my own knowledge.

250. Should you have known it if it had occurred do you think?—Yes.

251. (*Chairman.*) In what part of the town has the cholera made its appearance within the last few days?—In the low part of the town, very near the locality I have spoken of, where typhus fever was so bad.

252. What is the name of the place?—Sunderland Yard and Thorne's Lane, near the railway arch.

253. Cholera has broken out now, where typhus has before prevailed, very severely?—Yes, close by there. I may also state that in the West Riding prison there are 1,460 prisoners, 115 officers, and 15 other persons residing, and the excrements are thrown into the cesspools and carried through the drains into the river twice a month. About the 1st and 15th of every month the cesspools are flushed.

254. In what condition is the river at those times?—Awful. Up to a few months past the sewage was let out into the beck—Westgate Beck—when it found its outlet into this running stream, and it had to pass through this locality, where fever has been so bad, and where this person died of cholera. The parties have told me repeatedly that they have been almost poisoned out by the stench.

255. When the flushing of those cesspools takes place?—Yes. There is a great deal of hot water that comes from the mills which runs down this beck, and it aggravates the stench, and causes it to boil up on the top, and it becomes of various colours.

WAKEFIELD.

Mr. J. Johnson.

16 Oct. 1866.

256. You have the Wakefield prison cesspool matter turned into the river?—Yes, that is really so.

257. (*Mr. Harrison.*) Is that above the waterworks?—Yes, and close by the town.

258. (*Professor Way.*) I suppose such a discharge would be infinitely more than if it were passed day by day into the river?—Yes, much worse.

259. (*Chairman.*) Have you observed any difference in the condition of those ashpits as to the stench, whether they are old or new, and whether they have been three months or 12 months or longer accumulating?—The old ones are the worst.

260. In Wakefield gaol, does not the keeping of the refuse in tanks for the time which has been specified cause it to become putrid and to stink?—Most decidedly.

261. If this refuse were passed away day by day and every day, the stink would not be so powerful?—No.

262. The same quantity would be taken away, but under different conditions?—Yes, and it would not be so disagreeable.

263. It goes down an open ditch, does it not?—It did so, but for about two months past it has been turned into a drain which the local authorities have made.

264. To drain the gaol?—Not expressly for that purpose, but it has that effect; the outlet is the same.

265. (*Professor Way.*) What object is there in allowing it to collect for a fortnight, and then discharging it; is it to economise the water?—I cannot state. I asked that question from some of the officers of the prison, but I did not receive an answer.

266. Is no part of this sewage matter used for manure?—I am told not.

267. (*Chairman.*) Have they ever tried it?—Not that I am aware of; they are about doing so; they are thinking of it.

268. (*Professor Way.*) The object of the tank is not for the sake of collecting the manure to put on land?—It is not.

269. (*Chairman.*) There is a large asylum here?—Yes.

270. How many persons are there in it?—Officers and inmates altogether, 1,320; and the same kind of matter has all to pass through the centre of the town.

271. Is that retained in cesspits or in tanks for a length of time?—I cannot state how long, but the inhabitants along the side of the drain say that the worst stench is perceived about once in every week; it is offensive every day, but on one particular day in the week it is almost unbearable.

272. Has there been any attempt to utilize this refuse?—I am not in the least aware that there has. What is still worse the lunatic asylum is out of the borough, and there they might have made a drain to carry it the other way into the river and below the waterworks' reservoir, which would not have caused this annoyance which has been often complained of as a great nuisance.

273. The refuse now goes into the river above the waterworks?—Yes; it all goes to one outlet.

274. Can you state what number of inmates there are in the workhouse?—There are about 600, I understand, in the workhouse, and I believe they collect the privy matter there.

275. What do they do with the privy matter?—They have a great deal of land, and they make use of it. I am told that that is so. I have a good opportunity of seeing the drainage that comes to our place, and I have never seen any animal matter of this description brought down the drain.

276. How long ago is it since the cholera broke out?—Last Tuesday a person died in the lower part of the town, near Sunderland Yard.

277. How many other cases have occurred since then, if any?—None; there was only that one case.

278. (*Mr. Harrison.*) Was the case that occurred imported?—No; he was a man that had been working here for about two years, and a very steady man, of very regular habits.

279. (*Professor Way.*) If you were asked to point out the sources of pollution of the river Calder, at which would you begin if you began at the worst?—I would alter the outlet altogether.

280. I am speaking of the sources of pollution; which is the greatest, the sewage, or the refuse from the manufactures?—They are all very bad. I cannot say which is the worst. In the town I should say the prison is the worst, but the manufactories cause a deal of pollution as well.

281. The river receives sewage above the town?—There is more comes from above than is sent out from the town. When I was a boy, and before the waterworks were established, the river water was used by brewers and for domestic purposes generally. It was carted about in water-barrels; they sold it from 8*d.* to 10*d.* a barrel. My own mother brewed with it, and used it generally for domestic purposes.

282. Is it used for domestic purposes now?—No, it cannot be, it is so very bad.

The witness withdrew.

Mr. W. S. Wade.

Mr. William Swift Wade (of Wakefield) examined.

283. (*Chairman.*) Are you in practice in Wakefield?—Yes, as a general practitioner. I am a licentiate of the College of Physicians of Edinburgh. I practise generally both in surgery and medicine. I am Medical Officer of Health for the borough of Wakefield.

284. How long have you been in practice in Wakefield?—Between four and five years.

285. Have you seen much typhus fever in that time?—I have not seen a great deal as compared with other towns. We have had typhoid, but there has been no typhus here since 1849.

286. Have you found extra prevalence of disease in the neighbourhood of polluted streams, sewers, and foul ashpits?—I have.

287. Have you had reason to think that these have in any way intensified the disease?—I can mention one particular case that happened a few weeks ago,—the case of a woman I was called to. She lived in a yard called Wood's Yard, in Providence Street. Above 200 people live there. There are only two privies for all of them, and one midden in the centre between the two privies. The steps leading to her house were immediately over that midden and over one of the privies, so that any stench from those places would be likely to go into her door. She died in about eight days.

288. Is that same house occupied now?—I cannot say, but I think it is probable.

289. Have you any authority as medical officer to direct that house to be closed as unfit for human habitation?—I do not think I have, at least not to enforce such a direction.

290. Have you directed any house to be closed since you have been medical officer?—Yes; at least one house has been closed by the inspector of nuisances where there was a case of typhoid fever.

291. (*Mr. Harrison.*) I presume you report a case of the kind you have mentioned?—Yes. I reported the case I alluded to the Town Council.

292. Was any action taken by the Town Council?—Not to my knowledge, beyond cleaning out the midden; it was cleaned out.

293. (*Chairman.*) Have you paid sufficient attention to be able to say whether a full or an empty midden smells the worst?—An empty one. When the night soil has begun to come in it smells the worst, and then the ashes have a neutralizing effect.

294. If it is foul when full you cannot call it cleansing it when you empty it?—Not unless something to disinfect it is applied afterwards.

295. How long have you been acting as medical officer?—Only a few weeks.

WAKEFIELD.

Mr. W. S. Wade.

16 Oct. 1866.

296. You advise the council in case of any outbreak of disease, or when the inspector of nuisances wishes to have your opinion?—Yes. I have also to inspect diseased meat that the inspector of nuisances seizes. He calls me in, and I give evidence before the magistrates.

297. Do you know the general character of the river?—I do.

298. Do you think it ought to be purified, if practicable?—I certainly do; it requires it very much.

299. You probably heard what was stated as to the sewage of the borough, the gaol, and the asylum passing into the river, and you are aware that the water so contaminated is pumped and filtered for domestic supply?—It is; and I think it is very objectionable, both in this and in all other towns, to turn any sewage into a river.

299*a*. You think it ought to be prevented?—Yes, even if the river water is not used for drinking purposes, I think it circulates poison all through the land.

300. Is it your experience that the ash middens are a great nuisance?—It is.

301. You say that in one case you think you traced direct injury to health. Do you think that that is a common case?—Yes, I do.

302. If it was possible to substitute soil pans for privies to take away the soil—every day and every hour, and have dry ashes alone to remove, would not that be an improvement?—Yes; it would cause a great improvement in the health of the inhabitants round about those places. If it could be done without taking the night soil into the river, it would be a still greater advantage. I should recommend the substitution of waterclosets for privies in those crowded neighbourhoods, and I should still more do so if from those waterclosets the matter was not taken into the river for us to drink again.

303. Have you had any experience of the use of waterclosets by the working classes?—No, not in my own experience, but from what I have heard, there is great difficulty in getting them to keep them in a good condition.

304. Should you be surprised to hear that all over the poorer districts of London privies for the most part have been abolished and soil pans substituted?—I am aware that that is the case, and I believe it acts well too.

305. If 500,000 people use an apparatus of that kind, I suppose it may be fairly assumed that 5,000 might be taught to use it?—I think so.

306. (*Mr. Harrison.*) Have you examined the water that is at present supplied to the town?—I have not analysed it chemically.

307. Have you traced any illness to the use of that water?—I have not positively traced it, but I have often thought illness was caused by the use of the water.

308. Do you think that the water which is supplied to the town is in a proper condition for the health of the inhabitants?—It has been better recently, since they adopted the system of chemically filtering it. I thought a good many cases of diarrhœa and low fever were probably caused by the use of the water, but it is now very much better.

309. Do you think that if the river were restored to the condition in which it was in 1830 or thereabouts, it would be a proper source for the supply of the town?—I am not aware what the state of it was in 1830.

310. We have it in evidence that it was then in a comparatively pure state, and that fish were abundant?—I should think that a river where fish would live could not be very bad water for the domestic use of a town.

311. (*Professor Way.*) Apart from your knowledge of the source from which the water is at present supplied, which you know to be below the outfall of the sewers and so on, have you any reason to believe from any knowledge of the health of the people, that the character of the water supply has a prejudicial effect upon their health?—Not now; I think that there has been a very marked improvement.

312. You, as a matter of course, object to be supplied with water which has been once so fouled?—Decidedly so.

313. But leaving that knowledge and information apart, have you any reason to believe from the appearance of the water, and from the use of the water since the carbide has been employed, that it is a water which may not be safely used?—I think that the water is very materially improved. From my own knowledge I would not say that it is detrimental now.

314. Is it a water which you would have thought was decent water for use?—Yes, I think that it is.

315. Have you any other reason than your knowledge of the source, for objecting to the water?—I have not. I drink it myself, and I have the means of getting other water with a little trouble to my servants.

The witness withdrew.

Mr. W. Teall.

Mr. William Teall (Wakefield) examined.

316. (*Chairman.*) Are you connected with any of the local manufactures near Wakefield?—I am connected with the iron trade here, and also with the manufacture of candle material and oil from the waste greasy water of woollen and other fabrics.

317. How long have you known this district of Yorkshire?—All my life.

318. Do you remember the condition of the rivers in your early days?—I remember this river being full of fish. I have caught trout at the foot of Wakefield dam, when I was a lad.

319. What does the pollution now consist of above Wakefield, so far as your knowledge extends?—I should say that it arises from the refuse waters of the dye works, and woollen and other manufactories.

320. Do any of the manufactories tip their ashes into the stream?—To some small extent, but I have not much knowledge of that.

321. When did the pollution begin to take place, so as to be visible to the extent that it now is?—Perhaps 20 years ago.

322. Was it with the extension of the woollen manufacture?—Yes.

323. What special part of the woollen manufacture causes most pollution, the washing of the wool or the dressing of it, or the dying of it, or what?—Both washing the wool and dyeing, and also the fulling process.

324. I assume that the whole of the refuse matter used to go into the river some years ago?—The whole of it, I believe so.

325. At what date was this method commenced of extracting the refuse soap and oil from the water after wool washing?—I do not know; but it was carried on upon a small scale some years before I had anything to do with it, or knew anything about it. I have been connected with it some 14 years.

326. Then some persons may have carried it on for 20 years?—They have, upon a very small scale.

327. Does that process tend to the reduction of the impurity poured into the river?—Considerably.

328. Have you had experience in any other form of purification of the water, or recovering waste matter?—None, except in the recovering of indigo.

329. (*Professor Way.*) You are engaged in separating the oily parts of the waste water?—Yes.

330. Is that oil produced from the washing of the wool?—After the wool has been washed we collect the suds and water direct into tanks which we employ for the purpose. The moment a tank is filled we operate upon the contents with chemicals, which separate the thick or dirty stuff from the water. The great bulk is a

WAKEFIELD.

Mr. W. Teal.

16 Oct. 1866.

sediment which falls to the bottom; some portion flows on the surface. We run the water off between the top and the bottom, until the greasy matter, which floats on the top part, drops upon the lower part, the water which we turn away into the stream is then comparatively clear.

331. In that residue at the top and at the bottom you obtain a quantity of grease?—Yes, we put it into filters; we again take a further quantity of water from it, which is remarkably clear.

332. How do you get that?—By putting the stuff into loose filters, made of cocoa-nut fibre cloth, lined with a coarse kind of canvas.

333. The liquid drains?—Yes. The whole stuff is a sort of mud in appearance, the water flows and dries out; we then put it into a press with canvas bags, and operate upon it with pressure and steam. The grease runs out into a receiver along with some portions of dirt; this grease we afterwards clarify, and we bring it from all the manufactories in that state to Wakefield.

334. The process is done in the manufactory itself?—In some places it is done by separate men, where the manufactory is sufficient for that purpose; in other places we group several manufactories together by a pipe, through which the refuse water runs.

335. Do you work under a patent?—Yes.

336. What are those chemicals?—Sulphuric or muriatic acid. I took out a patent some few years ago, previously to which the process of recovering the grease was rather a lengthy one, but I found out some years ago that if you heated the suds to about 170 or 180 degrees Fahrenheit, whilst you added your acid, the separation took place a great deal more quickly, and the consequence is now that in 24 hours the grease may be in the soap chest, and finished in the cask.

337. Do you continue the heat afterwards?—No.

338. Is that an expensive operation?—It is rather expensive.

339. In the course of this operation is there any considerable smell of any kind?—No. There is a little smell while the acid is being added, but none in the process. The suds have had no time to effervesce or smell, they are so fresh.

340. When you speak of this as wool-washing, is the bulk of the liquid very large; does it require large tanks?—Pretty large; we merely have an additional number of tanks.

341. But they are not of such a size as would embarrass the manufacturer?—No, we have merely had them made of 3-inch deal about 12 feet by 6 feet, and 4 feet deep, holding about 10 tons.

342. In a large wool-washing place will there be many of these tanks?—Yes; in some cases we build them with stone in the ground, cover them over, and make the surface available for other purposes.

343. The residue having been brought home to your works, you convert this greasy matter into various kinds of oil?—Into stearine for candles and into cloth oil.

344. Is there anything besides the grease which is separated by this action?—Yes, the residuum which is left in the bags after heat and pressure, after we have got all the greasy matter which we can out of it. This is sold by us to manure makers, who use it along with other materials; it is said to be valuable for manure.

345. Does it form an important item in the pecuniary profits?—Yes.

346. Does the manufacturer himself get any advantage by so treating his water?—A very great one in some instances.

347. Do you pay a royalty?—We pay in a variety of ways; one mode, and perhaps the most satisfactory one for all parties is this, namely, for us to pay a certain price per ton upon the finished grease. We take the manufacturer's suds, he supplies us with steam, or sometimes we put up our own boilers, as the case may be. It is simply a question of price between us. We take all his soapy waters, and he receives so much per ton upon the finished grease.

348. It is not finished till you get it home, is it?—It is finished in a certain sense; it is used again by the manufacturers themselves very frequently; it is also used for soap making, and for many other purposes in that state.

349. It is an advantage to the manufacturer to allow you to step in and deal with his soapsuds in this way?—Undoubtedly. We pay one manufacturer 900*l.* a year for his soapy waters, and he finds nothing but those waste soapy waters.

350. What proportion does that bear to the value of the soap employed?—I could not state that, for this reason, it varies considerably, because in addition to the soap which is used, a great deal of oil is used in combing.

351. The liquid which runs away you say is by no means so objectionable in appearance as the soapy liquids would have been if they had gone direct into the river?—No; with proper care it is quite clear that it must be so; if it is not so, there is some carelessness on the part of the workmen.

352. In how many manufactories are you engaged in connexion with this process?—I think that we have about 120 establishments.

353. Spread over different parts?—All over the West Riding manufacturing districts, and also as far south as Leicester.

354. Still there are a great number, I suppose, which are not adopting that process?—No doubt; particularly the smaller manufactories.

355. Where probably it is not worth your while to collect it?—Just so; of course we take the best places first; there are hundreds of places not yet touched.

356. Would it be worth the while of the smaller manufacturers to collect their soapsuds in this way?—In some cases I think not; in some places I do not think that we could afford to pay them.

357. Could they do it for themselves?—I think not all.

358. They could only do it through the instrumentality of a firm like yours?—I think manufacturers could not do it so as to make it pay except their works were on a large scale.

359. (*Chairman.*) Do you say that there are hundreds of places in Yorkshire which are not treating their soapsuds at all?—I should think so, taking the outlying places.

360. Any large ones?—Not many large ones.

361. (*Professor Way.*) If the manufacturers could not obtain a profit by recovering the grease from their waters, at what cost could they do it?—In a great many instances it could be done without any cost to them if they would give their suds away. In several of the smaller places if they would make us a present of the soapy water we could get a profit out of it.

362. If they were compelled to keep the soapy waters out of the river, you, or persons in an analogous position to yourself, would step in and relieve them?—I think so, in a great number of cases, but not in all.

363. Probably the proportion of those cases where it would not be worth your while to interfere would be very small?—Very small.

364. And even there, if you were paid for taking away the soap instead of paying for it, or not paying anything it would not cost very much?—Not much.

365. Consequently, in your opinion, it would not be a great hardship to compel all manufacturers to do what some now do willingly?—I think that it might be done.

366. (*Chairman.*) You would not think it a great hardship if all persons who even treat their soapsuds were compelled to bring that treatment up to some ascertainable standard of purity?—I do not think that it would be.

367. And also if all persons who now turn soap refuse into any stream were compelled to have their soapsuds treated (as experience shows they can be

treated), so as to prevent the impurity, whether it would or would not pay them?—Yes.

368. (*Professor Way.*) I suppose that we should not be right if we considered these liquids to be merely soapy water?—No.

369. They are very much more foul and impure than mere soap dissolved in water?—Yes, no doubt of it.

370. I am not speaking of that which runs into the river after your process, but of the water which you take?—Yes, undoubtedly it contains a good deal of other matters.

371. Animal matters from the wool?—Yes. I may also state that by a new patent—a French patent, which we have lately purchased which I believe will become of very general use in England, as it is now in France—a very large quantity of pearlash may be obtained from the wool before it is touched by the scouring process, by merely putting it into cold water. In fact, we have it now in operation in three or four places at Bradford; but I may say that in England it is a far more difficult matter to introduce a new thing than abroad.

372. (*Chairman.*) For what reason?—I cannot state that. In France it was very rapidly introduced. We have operated several times, and found that the unwashed wool, that is to say, wool which has not been washed in the fleece, produces a very large quantity of potash of a very valuable kind.

373. (*Professor Way.*) And therefore the separation of it is very profitable?—Yes; and it is so simple that it is soluble in cold water, and instantaneously. By the wool being merely put into a tub filled with cold water, and allowed to remain for a minute or two, the water drawn off at the bottom contains all that can be got from the wool.

374. That, I suppose, would not have any effect in the subsequent treatment of the wool?—They say that it improves the wool, and that the wool scours better.

375. (*Chairman.*) Is there any Government inspection in this respect that you are aware of?—Not that I am aware of.

376. Do you think that if a Government inspection were established to compel the treatment of these fluids and the treatment of wools so as to preserve these materials which are proved to be valuable, it would be an improvement?—I do not think that it is done generally in France, except in the larger works. I know that in France last year 1200 tons of potash were recovered from unwashed wool, and was sold at from 35*l.* to 40*l.* per ton. That potash was recovered by merely immersing the wool in cold water. It first of all produces an article like porter in appearance, then that is evaporated until it is a sort of thinnish pitch, that is merely calcined and washed, and the potash is completed.

377. (*Professor Way.*) If the wool has not been so treated this potash would be in the soapsuds?—It perhaps would be in the refuse in the bags after pressure; it would go with the water.

378. You say that the liquid which runs away after the process of separating the grease is very much less objectionable?—Undoubtedly.

379. You say that it is a productive process, and that there is no difficulty in carrying it out in small establishments as well as in large ones, except so far as regards the question of profit?—Just so.

380. You have mentioned indigo from the dyeworks—Where indigo is used for pilot cloths, police clothing, and that sort of cloth, we recover a good deal of indigo from this very residuum or manure, after we have extracted the grease.

381. And that makes the process still more advantageous?—Of course.

382. That indigo therefore is prevented from going into the stream?—Yes.

383. In the case of indigo, is the water which flows away from the process equally clear as when indigo is not present?—It is quite clear.

384. It is not coloured from indigo?—Not in the least.

385. The process prevents any indigo from going into the stream?—Yes.

386. Consequently, if we see a stream coloured blue with indigo, we may say that that indigo has come in with the soapsuds, and might have been kept out?—I do not know that we could recover any indigo from a spent vat; at least we have never tried to do so.

387. But you can from the refuse water from the washing of indigo dyed goods?—Although a portion of the indigo will come away with the grease, a very large proportion remains with the cloths. Of course there is a further process after this brown grease is got; the process is distillation and pressure, but that is a very well known process.

388. Is this trade open to the public; have any of your patents expired?—We have no patent as connected with our operations, except the one for adding steam during the process of separating the grease from the soapy waters.

389. (*Chairman.*) Have you any idea what weight or what volume of material per week or per annum in round numbers is now obtained by this treatment of soapsuds?—I do not know.

390. How many tons per annum do you get yourselves?—We obtain about 50 tons per week.

391. Are 50 more tons got by all the trade?—I should think not more.

392. Then you think that about 100 tons per week would be got now?—I should think so.

393. (*Professor Way.*) That is not including the manure?—No; that is the clear fatty matter ready for distillation.

394. (*Chairman.*) About what is it worth a ton?—About 18*l.* We have a better sort, a more oily sort, it may average about 20*l.* a ton; from 18*l.* to 20*l.*

395. Do you think that if the whole of the wool washing were treated in the same way another 100 tons might be added to it?—I should think more.

396. Then there would be upwards of 200 tons a week?—I should think so.

397. And its value would be about 20*l.* a ton?—I will say about 18*l.*

398. Do you think that we might go as far as 250 tons a week?—It is partly guess work with me. I should say 200 tons at all events.

399. That is 4,000*l.* a week which is recoverable?—Yes.

400. And you are conferring that much wealth upon the community, and saving the pollution of the river as well?—Yes.

401. (*Professor Way.*) That is the value, but that does not represent the profit?—That is both prime cost and profit; that is what the result is worth as a manufactured article. I should say that the manufacturer would receive something like one-third of that amount himself. We pay 5*l.* a ton upon the grease as it comes away, so that the profit is something less than one-third of what I have put as the value.

402. (*Mr. Harrison.*) And the expense to the manufacturer to that point is not large?—He has no expense except finding premises and steam in some cases, but that is very trifling.

403. (*Chairman.*) Knowing the woollen manufacture so well as you do, is there any other process, either paying or otherwise, in the course of the manufacture in which you think that the manufacturers might lessen the amount of impurity which they turn away from their works?—I do not know.

404. Are soapsuds injurious otherwise than by discolouring?—I should think so.

405. They very soon putrify?—Yes.

406. (*Professor Way.*) They help other things to putrify?—No doubt.

407. (*Chairman.*) Therefore, soapsuds are a most noxious thing to turn off the premises?—No doubt.

408. Indigo is a mere discoloration to the eye?—I think so, but I am not an authority upon the subject.

409. (*Mr. Harrison.*) What part of the liquid refuse is turned into these tanks of yours?—In the fulling process, practically we do not take all the water, because when the water arrives at a certain

WAKEFIELD.

Mr. W. Teall.

16 Oct. 1866.

thinness, we turn it off and do not allow it to run into our tanks. Paying what we do pay for our soapy water, we should have too much to operate upon with our acids and so on, if we allowed it to run in after it arrived at a certain thinness.

410. (*Professor Way.*) You are collectors of soap, and not purifiers of the river?—Just so.

411. (*Chairman.*) Do you think that there would be any injustice in asking the manufacturers to appropriate some of the profit to the further purification of that water, which is not quite rich enough for you to pay for it?—I should think not. I remember the time when they got nothing for those waters; for years we paid a manufacturer about 3,000*l.* for his soapy waters, and previously to that he did not receive a shilling; he however now manufactures his own grease.

412. (*Professor Way.*) Supposing that it was proposed to apply to the land the waste water of a wool dying establishment, would you think it desirable in the first instance to take the grease out of it before you so used it?—I should think so. I do not know that the land could derive any benefit from the grease.

413. Therefore, whatever steps might be taken by the manufacturers to purify the water before going into the stream, the process of separating the grease should be the first step?—Yes.

414. (*Mr. Harrison.*) In the West Riding, generally, machines are used for cleansing the wool in the first instance?—Yes.

415. So that you get all the liquor in that process?—Yes.

416. In indigo dyeing, very little is turned away from the dyers; they do not turn out their vats very frequently?—It appears very blue. A very small proportion of indigo will discolour a very large quantity of water.

417. Do you know whether it would pay to recover the indigo from the dyeing process?—Do you mean from the spent vats?

418. Yes.—I should think not. We tried some of Mr. Holdsworth's here, which we were very much disappointed in. We thought that from the large quantity of indigo wash which they ran away, we should reap a good deal, but we recovered nothing worth our notice.

419. (*Professor Way.*) What is the quantity of indigo which you get?—It is very small, comparatively; perhaps 120 or 130 lbs. per week.

420. Is not indigo worth a good deal of money?—Yes; it varies a good deal.

421. Is it not worth 6*s.* or 7*s.* a pound?—Yes.

422. Do you get so much as that for the recovered indigo?—Yes, in some cases quite that.

423. Is its quality as good as that of indigo which is bought in the market?—The recovered indigo, I think, is worth more than the original indigo.

424. Because it is purer indigo?—Yes.

425. Having gone through chemical processes, which original indigo ought to go through?—Yes.

426. Have you seen or heard of a press called Needham's press, used for the separation of solid matters from liquid?—I have not seen it.

427. It is a press for separating liquids from solids by pumping the mixture into chambers, and then placing it under pressure. Do you think that anything of that kind would be injurious as regards indigo?—I think not. I do not know how by Needham's process you would operate upon the very hot material. The process is a sort of filtration, and the whole body would go through.

428. You mean when the grease was liquid?—Yes; I am speaking of the indigo, being in a liquid state, containing a large quantity of water that is very hot; it is boiled. I do not know how, by any process except by the settling process, you could get the water from it.

429. Is the liquid which you send away from the grease as pure as it might be if it were properly filtered?—I think so. In all cases of water from the cocoa-nut fibre filters it is as clear as crystal. It is far clearer than our Wakefield water.

430. (*Mr. Harrison.*) Is it acid?—It ought not to be so; if so, it is from an excess of acid having been used.

431. (*Professor Way.*) Is there any process by which it may be made still purer, so that you should discharge nothing into the river in a solid state?—I do not think that anything is discharged into the river in a solid state. The question is, whether the excess of acid can be prevented. We are as careful as we can be not to use an excess of acid, because the very article of the cloths in which we fold the mixture up, in order to put it into the presses, is a very important article, and costs us about 2,000*l.* a year.

432. I suppose that there is a large quantity of lime in a state of lime salt discharged into this river?—Yes.

433. May that be a cause that the Wakefield water is harder than it used to be?—I cannot say.

434. Have you ever heard it suggested that that was the case?—No; but I know that since I have been in business as an iron founder, our brass buckets and pumps and other parts of the engine wear far more quickly than they did 30 years ago.

435. You, I suppose, are not the only people who use acids?—No; the dyers use an enormous quantity.

436. (*Mr. Harrison.*) At present you recover the indigo merely from the refuse from the first of the fulling process?—That is all.

437. Do you see your way to removing the remainder of the indigo that is left after the dying process, and after the cleaning process, so as to prevent the fouling of the river?—I do not. It is impossible to dye a piece of cloth without using a surplusage of indigo, that surplus indigo must wash out, and go away with the stream.

438. And you think that if means were taken at every dye works of abstracting the indigo to the extent to which you do, there would still be a sufficient quantity passing into the river to discolour it almost as much as is now the case?—I should think that some might be recovered, but I do not know any means of recovering it to make it pay.

439. With regard to the 900*l.* which you said you pay to one manufacturer alone for the soap suds, is that for the soapsuds from the wool cleaning and also from the fulling?—He does not full; it is simply from his wool washing, and his back washing, and his yarns.

440. Do you know at all what quantity of wool he uses in a year?—I do not, but it is a considerable quantity.

441. (*Chairman.*) Is it wool or alpaca?—Both wools and alpaca.

442. (*Mr. Harrison.*) Do you think that the weight of potash which is obtained from the wool of which you have spoken is sufficient to make it of importance in ordinary sheep washing?—I am not aware; I do not know how it could be collected; sheep are generally washed in a running stream.

443. But it is not unusual to give them a dipping first of all, a good wetting?—You would have too much water; the expense of evaporation would be too great to make it pay; your water would be too weak.

444. You say that the potash in a very short time collects from the wool?—Instantaneously. The first water which ran off might only be at a density of 1,000, and at a density of 900 it would not be worth working; the expense of evaporation, and cooling, and so on, would be too much, but if you continually use the same water it perhaps will come off at 1,100, or 1,130, or 1,140, and when it comes up to 1,100 we consider it sufficient.

445. You may in that way get it up to a sufficient density?—Yes.

446. (*Professor Way.*) In washing the wool, after you have put fresh quantities of wool over and over again into the same liquid, do you increase the

WAKEFIELD.

Mr. W. Teall.

16 Oct. 1866.

strength as they do in the alkali works?—That is the proper way, by having a series of tanks. That plan is, no doubt, practicable, but the question is whether it would pay.

447. Does alpaca wool give potash in the same way?—Not much; the unwashed Australian wools seem to yield the most potash. We have not had an opportunity of trying it upon the skins, which we are about to do in the neighbourhood of Leicester in the course of another month or two. The wool upon the skin now is very short, and scarcely worth meddling with, but in the course of another month or two we shall make an experiment upon the skin; we shall put all the skins in a tank, and operate exactly as we do upon the wool, and see what will be the result; if we get much dirt with it we shall have a difficulty, because dirt will give density.

448. It is obvious from the information which you have given us that the separation of grease from the soapsuds is lucrative. What proportion of the total impurity of the river in your opinion is obviated by that process, is it anything appreciable?—I think so.

449. Is it a third, or a tenth, or a twentieth?—I scarcely know how to apportion it.

450. The river still remains very dirty, is that from the want of the process being carried out?—The river would still be very dirty after doing all that I have spoken of, but the process would do a great deal.

451. (*Chairman.*) The river, I suppose, would be impure from sewage?—Yes.

452. And from refuse discharge of every sort?—No doubt of it.

453. (*Professor Way.*) You do not deal with anything like the whole of the manufacturing refuse from wool works for instance?—No, but we deal with a large portion of the whole bulk; we recover more than all the rest put together.

454. After your process had been carried out with the utmost perfection, woollen works would still discharge quantities of refuse?—No doubt.

455. (*Mr. Harrison.*) Are there any of the materials used in dyeing, besides indigo, which are of sufficient value to make them worth recovering?—I do not know. I should think that there is nothing so valuable as indigo.

456. From the other processes than indigo, the vats are much more frequently emptied into the river than they are from indigo?—No doubt.

The witness withdrew.

Mr. J. Fowler.

Mr. James Fowler (Wakefield) examined.

457. (*Chairman.*) You are a surgeon?—Yes. I am one of the surgeons to the hospital and dispensary; I am not the parish surgeon.

458. To what points in this inquiry do you wish to speak?—I should wish to speak specially with reference to the condition of the river and the impurities which it contains, microscopical and otherwise. I cannot speak from memory respecting the microscopical appearances, but I have some papers upon the subject. (*The same was handed in and is printed at the end of the evidence of the witness.*)

459. How long have you been in practice in Wakefield?—I have been in Wakefield about four years. I have been in practice about two years. I was house surgeon to the hospital for nearly two years.

460. Have you seen much fever in Wakefield and the district?—I have.

461. What kind of fever?—Typhoid chiefly. The largest amount of typhoid which I ever saw in Wakefield was during three or four months in which the water was supplied to the town without any process of purification at all, with no filtration.

462. When was that?—It was about two and a half years ago, in 1864.

463. In what part of the town did those cases of typhoid fever occur?—Chiefly in Westgate.

464. Do you think that the fever and the water had any connexion?—I imagine that the water acted from the amount of sewage which it contained. The water was at that time loaded with animal matter, as one could see from microscopical as well as chemical experiments.

465. What did you find?—I found portions of muscular fibre, starch, vegetable epithelium and other constituents of fæces.

466. Did you get any refuse from the soapworks?—None which I could recognize. The things which I could clearly detect I have mentioned, but there were a great many other things which I could not clearly speak to.

467. Have you refuse from coal mines?—Yes.

468. What character would that give to the water?—I should expect some sulphuretted hydrogen, though I don't suppose that coal mines give any large portion of impurity.

469. You have soapworks?—Yes, a large portion of lime enters the water from them.

470. You have the sewage from the West Riding prison?—Yes.

471. That would be sewage in a putrid state?—Yes. I have mentioned in my report the drain from the prison, but the main drain of the prison is underground.

472. What do the Yorkshire Fibre Company manufacture?—A sort of fibre matting, from Chinese grass, a quantity of alkali is used, and it makes the water very impure.

473. (*Professor Way.*) Is that liquid very dark?—Yes.

474. Is it very like coffee?—Yes, it is a sort of tan-coloured liquid.

475. You have been speaking now of the river water?—Yes.

476. And the water supplied to the town before the process of filtration?—Yes; these microscopical and chemical results came from the water as it was supplied to the inhabitants two years ago; the water was suppleid to the inhabitants in exactly the same condition as it was pumped out of the river, except that there had been a partial subsidence.

477. But there was no filtration?—None whatever.

478. Have you examined the water lately?—Yes, and the water is, I believe, as good as it is possible to obtain it from the river. It is now very fair.

479. Have you examined it microscopically lately?—Yes, and I have not been able to detect anything injurious in it.

480. Would mere mechanical filtration have separated all the objectionable matters?—No, I think not, but I have not recognized any microscopical impurities lately.

481. I suppose that the mere mechanical filtration of water would remove all the animalculæ which were of any considerable size?—Yes.

482. But of course they would be liable to be reproduced from the germs of soluble organic impurity which would pass through the filter?—Yes.

483. In the case of this water have you kept the water for any time so as to allow of that development?—No.

484. But at the time when you examined this water it was free from that objection?—Yes, it was free from animalcules and other microscopical impurity.

485. (*Mr. Harrison.*) Have you made any chemical examination?—Not particularly.

486. (*Professor Way.*) You find in the water what you would find in most river waters?—Yes, except that there are larger quantities of some things, there is a much larger quantity of saline matter than you find in general waters; the water is considerably harder than most waters.

487. In this district are you accustomed to soft

WAKEFIELD.

Mr. J. Fowler.

16 Oct. 1866.

water?—No, it varies. The lake water is moderately soft, and the water from the springs is a great deal harder, and also the water from the wells; but the filtered water from the river is very much harder than any other water in the neighbourhood.

488. Is it harder than the water from the wells?—Yes.

489. You know that Dr. Clarke's scale of hardness is generally used?—Yes.

490. And that London water is 13 or 14 degrees of hardness by that scale?—Yes.

491. Chalk waters being 19?—Yes.

492. Do you know the hardness of their water, as supplied?—I do not know it by Dr. Clarke's scale. I could not at that time lay my hand on Dr. Clarke's paper, and so instead of his test I used an alcoholic solution and pure white soap of a definite specific gravity. I had an ounce of water, and counted the number of drops required to be added to that water. In that way I made the hardness of the Notton water about 7, and the hardness of the Newmiller Dam water about 9, and of most of the wells in the neighbourhood 12 or 14, while the river water was 16; that is entirely an arbitrary scale.

493. Has this water the reputation of being a hard water?—Yes, I am sure that it has.

494. Is it not possible that a Londoner might call this water a soft water whilst you call it a hard one?—Yes.

495. What is your opinion generally of the water now supplied to the town?—That it is a very fair water.

496. You are not aware of any cases of sickness which could be attributed to it?—No.

497. Would it be equally wholesome if it were not filtered?—No, I certainly think that filtration makes a great difference.

498. Would filtration through sand have produced an equal result?—I should think not.

499. You therefore think that the material used is of value?—I think that it is. I cannot speak with absolute certainty. I merely give a conjecture, because I have not examined it chemically.

500. Do you consider the water unobjectionable, so far as you know, in point of health?—I do.

501. Where did you get the sample of water which you examined?—I drew it from a tap in the dispensary.

502. I am speaking of two years ago?—Yes, that was the occasion.

503. Is the tap on a system of constant supply, or is the water supplied through cisterns?—It is on constant supply at present.

504. Was it at that time?—There is a cistern at the dispensary.

505. Is the cistern often cleaned out?—Yes. I cannot say exactly how often, but the water which I examined two years ago did not go into the tank at all, but came by a direct pipe from the mains of the waterworks. It is a notorious fact that the water was so muddy that it was not fit even for ordinary washing, and that it was not fit for use in any way.

506. Was that at the time when the water was simply pumped up into the town?—Yes, I presume that it was never intended that that water should be drunk.

507. What other supply was there?—There were a few wells. Those who wanted water paid for it. I know many families who used to buy water at that time; private filters were used.

508. The upshot of your view is that the water has been very bad, and now is not bad?—It is very much improved. I can only give my opinion of its condition as a medical man, and not as a chemist.

509. In principle you would not advocate the use of water which had been so fouled as this water has been?—Certainly not.

510. No matter what process had been adopted?—No matter what process had been adopted with it.

511. You would rather have water which had never been foul?—Certainly. I can conceive it possible and probable that infection would be conveyed by this water; that if any infectious discharges entered the water, infectious diseases, such as cholera, might be propagated by it.

512. It has been said that the virus of cholera can be introduced by water from the excrements of cholera patients?—Precisely.

513. Supposing that you had cholera very rife in this town, is there any reason why the water being drunk, part of which had been the water of cholera patients, should produce cholera again?—I should think that it would, even after filtration, though I cannot say so absolutely.

514. You would not like to trust it?—Not on any account.

515. (*Mr. Harrison.*) Two years ago you say you found in the water matter not in solution?—Partly also in solution; the water I believe was loaded with organic matter in solution.

516. You found a mechanical suspension in the water which you could examine carefully with the microscope, such as you do not find in the water now?—Precisely.

517. And the removal of this matter you attribute to the process of filtration which has been carried on?—Precisely.

518. But you did not chemically examine the water then, nor have you done so now?—The water contained a large quantity of organic matter in a state of solution at that time, but it does not contain anything like the same quantity now, in fact I think that it contains hardly any animal organic matter in solution now, but I cannot speak upon that point with certainty.

519. (*Professor Way.*) Have you observed the water before and after filtration; I mean the water going into the filtering tanks and going out of the filtering tanks?—Yes.

520. Is there much difference between the two?—Yes.

521. Is there less organic matter after filtration?—The only means of discovering organic matter which I have adopted is by a solution of per-manganate of potash. If I take two tumblers, one with distilled water and another with another kind of water, I am able to compare the two. If one turns brown immediately, I say that it contains a great quantity of organic matter.

522. Might not this be produced by sulphuretted hydrogen which this water contains largely, and which has the same power of discolouration as per-manganate?—Precisely; but the particular specimen of water which I examined did not contain sulphuretted hydrogen.

523. Admitting that the water now supplied is vastly better than it was before, or than it would be without filtration, do you consider that the improvement is due to the particular filtering medium, or that the process is a mere mechanical contrivance?—I really cannot speak to that.

524. Have you any reason to think that the health of the population of Wakefield is directly affected by the condition of the Calder?—I do not think that at the present moment it is directly affected by the water.

525. I am not speaking of its being affected by the water which is drunk, but of the fact of the water, at certain seasons of the year producing effluvia?—That is an extremely difficult question to answer. I do not think that there is any doubt of the public health being affected indirectly. 20 years ago there was no cod liver oil or quinine used; blistering, bleeding, and purging were the practice at the dispensary, and patients throve upon it; but so far from that they would die under it now, and 2,700 patients require not less than 23 gallons of cod liver oil and 64 ounces of quinine, to say nothing of stimulants and extra diet.

526. In the last 10, 15, or 20 years, as far as you can learn, has the gradual increase in the quantity of quinine employed been in any sort of relation to the want of purity of the river?—I think that the want of purity of the river is one of many elements which cause quinine and cod liver oil to be used. The

want of cleanliness in the atmosphere and in the river, I take it, is the chief reason why so much cod liver oil and quinine are used.

527. There is a general deterioration of the public health?—Yes, consequent upon the want of proper ventilation and of proper drinking water.

528. Quinine being a specific in cases of low fever?—Yes, and in many other cases besides fever. The amount of quinine which is used is, I believe, very large.

529. Does it increase year by year?—Yes, in proportion to our number of patients, which increases also.

530. (*Chairman.*) Then you are somewhat in this condition, that formerly bad doctors could not kill, and now good doctors cannot cure?—I am afraid that it is so in a great many instances. I think that when there was a good wholesome river, and a pure atmosphere, people had no difficulty in keeping alive, but now they have a very great difficulty.

531. I suppose that if we were all teetotalers we should lay the mortality all upon the great additional quantity of beer and spirits which are now drunk?—I do not blame the river exclusively, but I cannot resist the conviction that it exercises a very important influence, with other causes; that it is one of many causes which are at work in deteriorating the health of the population.

532. Have you examined the state of the ash-middens of Wakefield in the crowded part of the town where fever exists?—Yes, but not recently.

533. Have they made themselves at any time evident to you?—Yes, I have frequently complained of them.

534. Is it your opinion that the fermentation of an ashpit, within a few feet of a patient, may have a much more injurious effect than a river, which is many yards distant?—I should think that it would have.

535. That the ashpit would be the worst?—Yes, certainly.

536. Then do you not think that the habit of retaining filth near to dwellings might be blamed as well as the river?—Very likely, so far as regards producing a great nuisance in Wakefield.

537. We have it in evidence that 9,000 two-horse loads of ashes and privy refuse are removed from Wakefield in the course of the year, which have been formed here. Do you not think that the piling up of that quantity of night-soil (which gives off gases known to be deadly in their effects) may produce a contamination of the atmosphere very much worse than any which the river can exercise?—I think so; it makes it so much worse for the ashpits, but not better for the river.

538. Certainly not, but when we are looking for causes for deterioration we may as well look to all the causes?—Certainly.

539. Do you think that the smoke, which is now very much greater than it was 30 or 40 years ago, may have a very prejudicial effect upon the inhabitants?—I think that it has.

540. (*Professor Way.*) Which of the two alternatives would you choose, that the solid and liquid matter voided by men and women should remain in the cesspits in the neighbourhood of the houses, or should be discharged into the river?—I should choose that it should be discharged into the river.

541. It would be better to put up with a foul river receiving the sewage of a town, than that that town should not be sewered at all?—I think so; but I would rather not give an opinion as to which is the better of two things, both of which I look upon as so injurious.

542. (*Chairman.*) Have you ever yourself made so close an inspection of districts having a foul river running through them, compared with districts free from river influence but having cesspools only, as to draw a conclusion as to which was the greatest evil?—I never have.

543. Then would you be surprised to hear, that when such an examination has been made, the river has been found a very innocent offender as compared with the cesspools?—I should expect that the river would be a less offender than the cesspools.

The witness withdrew.

REPORT by James Fowler, Esq., Surgeon, on the conditions of the Calder and its tributaries in the Wakefield district. (Referred to supra, Question 458.)

It would be difficult to find a more striking instance than that afforded by this part of the Calder, of the extent to which our Rivers have been defiled by sewage and refuse from manufactories. Its green banks and interesting scenery made it formerly a pleasing resort for the artizan and operative in hours of leisure, while its clear and sparkling waters invited the healthful recreations of boating, bathing, and fishing. Even so lately as within the last twenty years, anyone with a fly might in an afternoon catch a basketful of chub, each weighing at least two or three pounds; and during freshes, with a cast net, very frequently ninety or a hundred, sometimes even a hundred and fifty pounds of roach, chub, gudgeon, &c. were caught in an evening. On one occasion, where the water was let off from a quite short cutting belonging to the Calder and Hebble Navigation Company, at least four hundred and fifty pounds of eels were taken; in fact, whenever anyone wanted fish, a sackful might readily be obtained. Nothing of this kind has been known, however, since the springing up of manufactories in the vale of the Calder. Nearer home, soon after the Thornes Soap Works were begun, many stones of fish, which had come up the river to spawn, were to be seen floating dead upon the surface. During that year all fish forsook the stream as regular inhabitants. For some time after, however, during freshes, a fish was occasionally to be seen as a curiosity; and so lately as 1858 an experienced fisherman succeeded on one of several persevering trials, in capturing two small chub.

At present, the condition of the River is most disgusting. Defiled almost from its source, it reaches us with the accumulated refuse of Todmorden, Hebden Bridge, Sowerby Bridge, Halifax, Elland, Brighouse, Cooper Bridge, Holmfirth, Huddersfield, Mirfield, Dewsbury, Earlsheaton, and Horbury. At the suspension bridge about a mile and a half above Wakefield it runs slowly and in many places is almost stagnant. It has a bluish-black, dirty slate colour; and a faint, urinous smell which leaves an extremely unpleasant impression for hours after it has been once thoroughly perceived,—considerably worse than that made by the Thames after a stage on a penny boat. The banks and every twig and weed in reach, are coated with soft black slime or mud, studied on the edges of the stream with vivid crimson patches of annelides. Above are overhanging willows; and where the branches of these touch the water, especially in any quiet pool, large sheets of thin bluish or yellowish green scum collects, undisturbed save by the rising to the surface of bubbles of fœtid gas. Between this point and Wakefield, the refuse of extensive soap works and worsted mills enters, causing discolouration for several hundred yards. I have, in fact, traced large quantities of soap-scum beyond Porto-vello, a distance of about half a mile. Nearer the town, quantities of refuse from extensive dye works are continually being discharged, to say nothing of the periodical emptying of spent liquor and vat sediments. On the opposite side are two full streams, one of sewage, the other apparently from some cotton mills; and here it may be stated that the exact degree to which influxes of this kind injure in different cases is extremely difficult to estimate; some manufactures using ammonia, while others adhere to the old fashioned pigs' dung and urine. The banks on each side are here studded with granaries and malting-houses, from the latter of which are received that most pernicious contamination, the steep-liquor of malt. There is also the refuse of at least one brewhouse and piggery, and of a second soap manufactory drained into the River before it reaches the outlet of Ings beck, at the dam immediately above Wakefield Bridge. In this situation, on any warm day in summer, torrents of gas may be seen rising to the surface, and every now and then large masses of mud, which float for a while, and then, after the gas they contain has escaped and polluted the atmosphere, break up and are redeposited, or they are at once carried down the River, stinking and putrefying in their course. The Calder and Hebble Navigation Company are periodically put to great inconvenience and expense in removing collections of this kind. About two

WAKEFIELD.

Mr. J. Fowler.

16 Oct. 1866.

years ago the mud had accumulated to a depth of 5 feet, and the water having been drained off, at least 2,000 tons were removed, but not one fish or living being of any kind was discovered. On the bridge, a water-mill has been for at least 700 years, and no one interested in the smell of partially oxidized sewage should omit to stand over the spray which ascends from the wheel. Masses of solid fæces may be seen at the grating through which the water is strained. Looking from the bridge westward, except in wet weather, is a large, open, shallow, almost stagnant pond of the most offensive character, with tracts of dark coloured mud constantly exposed. The sewer of the town with the refuse of the malt kilns, breweries, dyeworks, worsted, woollen and cloth mills, fibre mills, soap mills and grease works, enters by the main drain just below; its surface coated with froth of every conceivable colour and degree of filthiness, overhung by willows, in whose branches are entangled and exposed to view the most disgusting objects. The scum may readily be traced down the River for a considerable distance. The last defilement of moment is that from some extensive grease works, in which oil of vitriol is largely employed.

The Ing beck, to which I have already alluded, merits a few particular remarks, being the more important tributary the Calder receives in this district. On the day I last examined its outlet, the smell arising was most offensive. The general resemblance of the stream was rather to soup than water, and it had a dirty, greasy, yellowish, indigo-slate colour, where not coated by froth, scum, or floating filth. Its bed is silted to a considerable extent by black, fœtid mud, and its outlet partially obstructed by two large ash-heaps. It may be observed, however, that this is perhaps the only place in the neighbourhood at present where refuse ashes have been tilted, and that, though the height of the water in the River alters very considerably according to the state of the weather, the bed is not permanently raised much by solid refuse from manufactories, and that consequently we are not liable to innundations. Walking up the bank of the beck, one may form a fair idea of the kind of contamination which it receives. Besides dead dogs, tin kettles, old pans, boots, hats, &c., we find house-sinks, and surface drains, public-house refuse and factors' privies flowing in unscrupulously. Myriads of annelides in the mud on the banks subsist on the impurities; that in the neighbourhood of a warm sewer being, in fact, for some distance entirely concealed by sheets of moving pink. A railway waggon maker's establishment was a little while ago an artificial manure factory, and contributed greatly to the general pollution.

At the bottom of Thornhill Street are two strong foul streams, one of sewage, the other, on the day I visited it discharging deep indigo coloured stuff. Immediately above this the beck, though receiving muddy refuse from some cement works, was purple coloured, and where the branches of overhanging shrubs dipped beneath its surface, a polychrome froth and scum collected. A few hundred yards higher, having passed the place of entrance of the purple dye, the stream regained nearly its original indigo appearance. Near the Lawe Hill bridge was a dirty fall of hot mauve refuse, with several yards of rainbow-coloured scum. Where the water could be seen in one light it would have a bluish tint, in another a dirty yellowish; and the mud was very deep and flocculent. Nearer Chald Lane there was an extremely filthy ditch loaded with the privy and house refuse of a large number of cottages and low lodging-houses and two large streams of thick purple dye refuse. Above the dam in this situation enter the waste of a dye-works and shoddy mill, with the filthy privy and surface drains of Salt Pie Alley. The water here is the colour of the contents of a slop-pail, is almost stagnant, coated in patches, each of several yards, with scum, and is in other respects very offensive. At Brooksbank a kind of long oblong pond is formed, two sides of which are of thick mud, one exposing the privy refuse and excrements in three drains from the neighbouring cottages and lodging-houses. Balne beck also enters at this point. Going onward it receives the fouled water and other refuse of two large worsted mills, of surface drains, piggeries, and privies; then muddy water, apparently from some brick yards, and hot waste from a large woollen mill. Immediately above, however, the water becomes clearer and less coloured; healthy green confervæ begin to show themselves; long grass floats on the surface; shrubs grow up on the banks; and if a brown scum collects where the branches touch the surface, it has altogether a less disgusting character. Fairly out in the country the water is clean and sweet, and boys bathe in it in summer when deep enough.

Balne beck is on the whole as yet tolerably clean, the sides only being lined with mud, patched with red, and the stones at the bottom coated with long trails of green confervæ. The principal impurities are from a soapworks, a coal-mine, a skin-preparing shed, a brick-field, and the West Riding Prison. The Yorkshire Fibre Company did a short time since drain a large quantity of poisonous matter into the beck, but is at present restrained by an injunction.

The Water Company's Works are situated about two and a half miles from Wakefield Bridge, and consequently receive the water in an extremely unfavourable condition. I have not any recent minute observations by me, but the following is a tabular statement of the result of a lengthened microscopical and chemical examination of the water during the summer of 1864:

- Animal
  - Living
    - *Protozoa:* Monas, Uvella, Vibrio, Arucha, Actinophrys, Spiculæ of fresh-water Sponge. The last from the Barnsley Canal.
    - *Rotifera:* Rotifer, two species.
    - *Infusoria:* Vorticella, Coleps, Paramecium.
    - *Annelida:* two species.
    - *Entomostiaca:* Cyclops, Daphnia.
  - Dead
    - *Muscular fibre,* altered and decaying; from sewage.
    - *Phosphates, Nitrates, Sulphur, and Ammonia;* from sewage.
    - *Organic matter in solution;* from sewage.
- Vegetable
  - Living
    - *Fungi:* two microscopic species.
    - *Diatoniaceæ:* Fragillaria, Asterionella, Nitzschia Surivella: from the Barnsley Canal.
    - *Desmidiaceæ;* Staurastrum, Navicula, from the Barnsley Canal.
    - *Confervæ:* two or three species.
  - Dead
    - *Starch,* from sewage.
    - *Vegetable Epidermis and decaying tissue,* from sewage.
    - *Sporules.*
- Mineral
  - *Chlorides,* and *Sulphates* of *Lime, Magnesia, Soda,* and *Potash.*
  - Diffused *Silica* and *Alumina.*

On stirring up the mud from the bottom a Winchester quart of gas was readily collected by means of an inverted funnel, and was found, on examination to consist chiefly of carbonic acid, light carburetted hydrogen, sulpuretted hydrogen, and free nitrogen.

It is not easy to estimate accurately the effect of nuisances of this kind on the public health. Two years and a half ago, whilst the waterworks were undergoing improvements, and for some months the supply to the town was merely pumped up from the River into the mains without filtration the actual mortality was not increased. Still, as I had occasion to represent to the Local Board at that time, there was a greater amount of diarrhœa, continued fever, erysipelas, diffuse abscess, and of cutaneous and subcutaneous cellular inflammation; while the inflammation generally was peculiarly liable to take on the erysipelatous form and become unmanagable, and the convalescence from various diseases to be unwontedly interrupted and prolonged. Possibly this, and even an increased death rate had it occurred, might have been explained in part by other causes; but I cannot resist the conviction that bad water as a beverage, and the taint which it communicates to the atmosphere, bear a most important part both in causing actual disease and in weakening the power of the constitution to bear up against disease, and so shorten life in that way. Greatly improved houses have been built for the artizan class during the last few years; greater attention has been paid to the ventilation of mills and workshops; the agitation for a people's park indicates how wide awake the population is to the benefit of fresh air; wages have increased; the character of the food consumed is more closely inspected; the drainage is more efficient; many open sewers have been closed; bad wells have been stopped; but both the death rate and the amount of disease have increased. An indication of the extent to which constitutional vigour has at the same time diminished, is found in the fact that less than 20 years ago to blister, bleed, and purge was the routine of the physician's practice at the dispensary, while cod-liver oil and quinine were unknown. This mode of treatment, if it did not cure, certainly did not kill; for the patients did well under it, having strength to bear up against and conquer both disease and treatment. Now, I will venture to say, that 99 per cent. of our patients would sink under the depletory measures of by-gone days, and I may add that during last year, in a practice of only 2,700 it was found necessary to prescribe no less than 23 gallons of cod-liver oil, and 64 ounces of quinine, to say nothing of nourishment and stimulants.

(Signed) JAMES FOWLER,
Surgeon.

Wakefield,
15 Oct. 1866.

SAMUEL HOLDSWORTH, Esq., M.D. (Wakefield), examined.

544. (*Chairman.*) You are an alderman of this borough?—Yes.

545. You have heard the evidence which Mr. Fowler has just given?—Yes, I have heard the whole of the evidence.

546. Do you agree generally with the evidence which Mr. Fowler has given, relative to the causes of disease, and the fouling of the river?—I do.

547. How long have you known this district?—Since my birth; I am a native of Wakefield.

548. In your boyhood was the river any purer than it is now?—There were fish in it at that time. I used to catch fish.

549. What kind of fish?—Eels and perch and chub, and dace occasionally.

550. Do you think that there are any fish in it now?—No.

551. You have not had fish for many years?—Not perhaps for 12 years.

552. Have you been in practice as a physician during the time that you have resided here?—Yes, since 1847 or 1848, about twenty years now; I commenced practice here sooner, but I had to leave Wakefield on account of health, so that my practice extends I may say over nearly 30 years.

553. Have you witnessed any alteration in the types of disease during that period, so peculiar as to impress itself upon you?—Very much so.

554. What changes have taken place?—Formerly it was the universal practice to use the lancet and cupping, and blood letting, but now the lancet rusts, and the leeches die for want of being used, and the cupping glasses are laid aside—from years end to years end—I do not suppose that the cupping glasses are used at the dispensary.

555. Is that from an improvement in the art of surgery or from a deterioration in the patients, so that you do not dare subject them to that treatment?—I presume that it arises from a different type of disease from what we had 30 years ago.

556. Do you suppose that that state of things is general?—I believe that it more or less pervades extensive manufacturing districts, but I do not think that there is, in the rural districts, any very great difference compared with the state of things 30 years ago.

557. Are bleeding and cupping resorted to in the rural districts?—Not to the same extent as formerly. Certain influence has been at work for many years, which doubtless has reached the medical profession in the agricultural districts, but I certainly consider that the type of disease in manufacturing towns is very much changed.

558. Is it not a fact known in your profession that diseases run a course like the course of an epidemic, begin and become as it were rampant and expend their fury and partially die out?— Yes, we have epidemics of influenza.

559. But is not that the case with special types of disease?—I am aware that gaol fever has disappeared, but we have typhus fever in its various forms which is allied to gaol fever.

560. Have you at all made yourself acquainted with the mode of disposal of sewage in this town, or the retention of refuse in ashpits?—My knowledge is general upon the subject.

561. Have you heard that at the West Riding prison the refuse of 1,460 persons is passed into tanks till it becomes putrid, and is then at intervals passed down certain drains into the river?—Yes; the cesspool is flushed at intervals such as once a fortnight.

562. Do you think that that is likely to be injurious? Yes, I think highly so.

563. And the same may be said of the asylum?—Yes, exactly the same. We unfortunately receive the whole refuse of the West Riding asylum through Wakefield, and up to this summer the refuse discharged from the asylum has passed down for a considerable course in an open drain. This open drain has been supposed to have to do with sickness in that locality. During the past summer it has been covered over by an arrangement between the magistrates and the corporation, but so far as the river is concerned the whole refuse from the asylum still finds its way through the town into the river. Why the magistrates do not retain it and manure the land with it I do not know. I have often wondered that they had not a system of tanks by which at any rate they might have collected some of the sedimentary refuse, and have used it, as they have a considerable extent of arable land.

564. I suppose that the pollution of the river has grown up with the increase of population?—Yes.

565. Do you know the character of the water which is supplied to Wakefield for drinking purposes?—Yes.

566. Do you use it?—Fortunately I do not, nor my family.

567. Why do you say "fortunately"?—I always feel that great risks are run by drinking it.

568. Have you known in your practice any evil effects caused by persons drinking it?—Not directly.

569. Have you had any complaints in your practice from persons drinking it?—Repeatedly, especially during the period detailed by Mr. Fowler two or three years ago; that period during the hot time of the year, and at that time the supply was irregular, though perhaps not to be called intermittent; but I know that for long periods up at St. John's and the high parts of the town, the supply was very inadequate to the wants.

570. What was the cause of that irregularity?—It was owing to certain alterations going on at the waterworks. It was, of course, a period which was attended with great danger to the health of the inhabitants, but fortunately the water is very much improved now compared with what it was then excepting its hardness.

571. Is it much harder?—My impression, from the quantity of soap used, is, that it is harder than it formerly was.

572. You use it for washing?—Yes, for baths, and for waterclosets.

573. Have you any idea what causes the hardness?—No, I do not know to what to attribute it, unless to the iron used in the process of filtration.

574. (*Professor Way.*) Would the water itself of the river be harder now than it was at the time which you speak of?—I cannot say.

575. Has the corporation at all discussed the question of a better supply for the borough?—Yes, at different times.

576. As we have heard from the deputy town clerk there was, I think, an attempt in 1861 to treat for the works?—Yes.

577. Were you in the council then?—Yes, I took an active part in the endeavour which was made to purchase the works.

578. You are aware that at present the sewage is sent down net into the river. Have you at all considered the question of its utilization or its treatment before going in?—Yes, generally. I have been continually alive to the question, but I am free to confess that I have not myself seen my way out of the difficulty.

579. Have you seen any of the places where sewage is utilized, as at Edinburgh?—No; we had a report from one of our borough surveyors, Mr. Tarbottom, as to the Leicester works, some time ago, but I believe that the works there are all now discontinued.

580. (*Mr. Harrison.*) What was the date of that report?—It would be about 1858. You asked Mr. Fowler as to whether it would be preferable that the night-soil and ashes from the houses should remain near to the houses, or be sent into the river. My opinion would be rather different to his. I should be more disposed to give a decided answer against its going into the river.

581. (*Chairman.*) Would you retain it where it is at present?—Yes, I should endeavour to retain it, but to retain it in such a way as not to be injurious to

WAKEFIELD.

S. Holdsworth, Esq., M.D.

16 Oct. 1866.

health, or to reduce that injury to the minimum either by the dry closet system, or by the daily removal of all animal and vegetable refuse from houses, by a constant system of cartage. It has been stated that 9,000 two-horse loads of refuse are yearly carted away from Wakefield. I should not mind if it was double that amount, provided that there was not an intermittent system, but that the system was perpetual, and that the refuse was carried away with such rapidity that it could not become in any way a nuisance to the inhabitants.

582. That it should not set up fermentation ?—Yes.

583. (*Professor Way.*) How could you accomplish that object ?—By the dry system.

584. Do you mean by the use of earth ?—Yes.

585. By Mr. Moule's plan ?—Yes, so far as it could be adopted. That is yet in its infancy. I do not express a decided opinion upon the dry system, but I think that it is desirable to keep as much as possible all animal excrement out of the river.

586. (*Chairman.*) In using the expression "dry system," I suppose you are aware that no operation of that kind would secure absolute dryness, that there is urine to contend with ?—Yes, I have not seen my way out of that, but I would deal with the soil excrement.

587. (*Mr. Harrison.*) And there are the slops of the houses ?—Yes, they must be as they are now.

588. (*Chairman.*) You are aware that with any dry system you must have sewers and drains for the street water and refuse water, and that you must provide houses with this extra apparatus for the dry system, as you call it ?—Yes, by using ashes, and by a different system of building privies, the dry system could be carried out to a very considerable extent.

589. You are aware that with patients, under many conditions, it would be impossible to keep the places clean as you do now by waterclosets, and that the matter would come in contact with the surface, and become putrified, and that if you once set up putridity every atom of refuse which you put in connexion with it would rapidly take the same form of corruption ?—Yes; but I am not wedded to the system, because I do not see how it would deal with the fluid part of the refuse.

590. Taking your own house, or any gentleman's house, you may have two or three waterclosets, and so long as the company supply you with water, and the closet is kept in repair, the process goes on evenly without any intervention of a second party, and certainly without any nuisance from the closet, if properly used, and you and your servants know nothing of it. But if you have what is called the dry system, you must charge your pan with the dry earth ?—Once a week.

591. If the earth gets wet and saturated, how are you to dry it ?—If you name houses of a certain class, I do not suppose that the dry system, from what I have seen of it, is likely to be introduced for some time; but in reference to cottage property, I think it quite possible to have a system by which dry earth may be used. To some extent, dry ashes take the place of dry earth. We have a large number of cottages and close yards, and ill-ventilated yards, in Wakefield, many of them being closed at one end. There could be receptacles into which the refuse might be thrown, and regularly taken away. The matter should be entirely under the control of the authorities, and the owners or tenants of the properties should have nothing to do with the refuse; and in cases of that kind, meaning cottage property, I think that there would be an advantage in carrying away the refuse to the land by boats, or by farmers' carts, over sending it down drains.

592. In Lancashire a company was formed to carry out what is called the Eureka system—the dry system ?—Yes.

593. But they have failed to make it pay ?—Yes. A Local Board of Health would look for a return of profit in the form of improved health to the inhabitants, and therefore would be able to do what private enterprise could not do.

594. (*Mr. Harrison.*) As to any comparison between carrying the sewage into the river and having the present cesspits adjoining the cottages, are they not both of them abominations ?—Yes.

595. And neither of them ought to be allowed to exist ?—No, or only to exist in such a form that they could not be calculated in any way to be objectionable or injurious to health.

596. To what do you attribute the altered nature of the type of diseases in the district ?—It is very difficult to assign it to any one particular cause. How far the increased amount of smoke, and the condition of the water in past years, and other circumstances which I cannot now enumerate, may have had to do with it I am not prepared to say. At one period we undoubtedly suffered, and I think that it is probable that persons were really injured by the effluvia arising from some extensive greaseworks, belonging to Mr. Teall, who has given evidence here this morning, but there is not the same amount of ailment from the deteriorated state of the atmosphere from those works as was the case some years ago.

597. (*Mr. Harrison.*) Are you aware that the sewage of the town of Croydon, is now most beneficially and profitably applied to the land ?—I have understood so, but I have not seen it.

598. Has your surveyor seen it ?—No.

599. Have your corporation taken any steps to make themselves acquainted with that subject ?—I think not, we have not lately had our attention directed to preventing the sewage going into the river—we have been more occupied by sending more sewage into the river, by draining those districts which hitherto were not drained.

600. You are increasing the evil and are taking no steps to remove it ?—Just so.

601. Do you not think it desirable that your corporation should set about doing something of the kind ? — Corporations are generally very sluggish bodies to move.

602. Then you think that a little help from Government would not be amiss ?—It is a question of the amount of interference. Those bodies are generally very tenacious about being interfered with, but I do not know that it might not be well if some more stringent measures were exercised upon representative bodies in towns than at present exist.

603. As a medical man, I apprehend that you object to the system which Wakefield now employs of discharging the sewage into the river a very short distance from the point where they are drawing their water supply ?—Yes.

604. You cannot approve of it ?—No. During more than half the year there is always a very obnoxious smell from the water in the river. It is used to turn the water-wheel of a flour mill at the foot of a bridge going out at the south side of the town, and you can get a scent-bottle in perfection by the friction of the water upon this water-wheel.

605. (*Chairman.*) What is the general health of the miller, and of the men who work about that mill ?—It is to be hoped that they do not get the smell inside. It is received by the inhabitants who pass there.

606. (*Professor Way.*) Is it not generally considered that by sewering a town and getting rid of sewage matter, even into the river, you are advancing a step, though perhaps you are creating another evil, but an evil not of parallel magnitude ?—I do not approve of the system of waterclosets for all classes of houses.

607. You would like a dry system ?—Waterclosets for the working class are continually out of order. Children throw all kinds of things into them, they become obstructed, and then they become a far greater evil than a privy or an ashpit.

608. (*Chairman.*) Do you think that you are justified in using those terms if you have not made yourself acquainted with what has really been done elsewhere ?

If I should tell you of thousands and tens of thousands of waterclosets in existence among the working classes which are not abused (and this is the case), would that be an answer to you?—We have tried them in Wakefield. I have done all I could to prevent the houses for the working classes having waterclosets, when plans have been sent in for buildings. My opinion is that the privy might be used in such a way that all the ashes from the houses might be sent into it, and all the excrement might be removed, so as not to be injurious, even in hot periods of the year. Combined with that system of privies, I would have a system of continual removal.

The witness withdrew.

Adjourned to to-morrow at 11 o'clock.

Wakefield, Wednesday, 17th October 1866.

PRESENT:

ROBERT RAWLINSON, ESQ., C.B., IN THE CHAIR.

JOHN THORNHILL HARRISON, ESQ. | PROFESSOR JOHN THOMAS WAY.

Mr. EDMUND LYNAM (of Wakefield) examined.

609. (*Chairman.*) How long have you been borough surveyor?—About eight months. I held an appointment at Bradford before.

610. About how much of this town is sewered?—Most of the principal streets in the town are sewered.
